But Mr Smeaton, as well as his predecessor Mr L'Abey, appears sometimes to have gone into a contrary extreme, and to have been somewhat too sparing in the use of piles. It is well known that the opening of Westminster Bridge was delayed for two years on account of the failure of a pier, the foundation of which had been partly undermined by the incautious removal of gravel from the bed of the river in its immediate neighbourhood; a circumstance which would scarcely have occurred if piles had been more freely employed in securing the foundation. The omission, however, did not arise from want of a just estimate of the importance of piles in a loose bottom, but from a confidence, founded on examination as the work advanced, that the bed of the river was already sufficiently firm. Mr Smeaton directed the foundations of Hexham Bridge to be laid, as those of Westminster Bridge had been, by means of caissons, or boxes, made watertight, and containing the bottom of the pier, completed in masonry well connected together, and ready to be deposited in its proper place by lowering the caissons, and then detaching the sides, which are raised for further use from the bottoms, which remain fixed as a part of the foundations immediately resting on the bed of the river, previous-

Bridge.

ly made smooth for their reception, and sometimes also rendered more firm by piles and a grating of timber. By a careful examination of the bottom of the river at Hexham, Mr Smeaton thought he had ascertained that the stratum of gravel, of which it consisted, was extremely thin, and supported by a quicksand, much too loose to give a firm hold to piles, while he supposed the gravel strong enough to bear the weight of the pier if built in a caisson. The bridge was a handsome edifice, with elliptical arches, and stood well for a few years; but an extraordinary flood occurred, which caused the water to rise five feet higher above than below the bridge, and to flow through it with so great a velocity as to undermine the piers, and cause the bridge to divide longitudinally, and fall in against the stream; a circumstance so much the more mortifying to the eminent engineer who had constructed it, as it was the only one of his works that, "in a period of thirty years," had been known to fail. It was observed that some of the piers which had been built in coffer-dams, with the assistance of some piles, withstood the violence of the flood; and it is remarkable that the whole bridge has been rebuilt by a provincial architect with perfect success, having stood without any accident for many years.

It seems, therefore, scarcely prudent to trust any very heavy bridge to a foundation not secured by piles, unless the ground on which it stands is an absolute rock; and in this case, as well as when piles are to be driven and sawed off, it is generally necessary to have recourse to a coffer-dam. In the instance of the bridge at Harraton, for example, where the rock is nine feet below the bed of the river, Mr. Smeaton directs that the piles forming the coffer-dam be rebated into each other, driven down to the rock, and secured by internal stretchers, before the water contained within them is pumped out. In some cases a double row of piles, with clay between them, has been employed for forming a coffer-dam; but in others it has been found more convenient to drive and cut off the piles under water, by means of proper machinery, without the assistance of a coffer-dam.

Piles are employed of various lengths, from seven to sixteen feet or more, and from eight to ten inches in thickness; and they are commonly shod with iron. Smeaton directs them to be driven till it requires from twenty to forty strokes of the pile driver to sink them an inch, according to the magnitude of the weight, and the firmness required in the work. He was in the habit of frequently recommending the piles surrounding the piers to be secured by throwing in rubble stone, so as to form an inclined surface, sloping gradually from the bridge upwards and downwards. In the case of Coldstream Bridge, it was also found necessary to have a partial dam, or artificial shoal, thrown across the river a little below the bridge, in order to lessen the velocity of the water, which was cutting up the gravel from the base of the piles. But all these expedients are attended with considerable inconvenience, and it is better to avoid them in the first instance, by leaving the water-way as wide and as deep as possible, and by making the foundations as firm and extensive as the circumstances may require.

The angles of the piers, both above and under water, are commonly rounded off, in order to facilitate the passage of the stream, and to be less liable to accidental injury. Mr Smeaton recommends a cylindrical surface of 60° as a proper termination; and two such surfaces, meeting each other in an angle, will approach to the outline of the head of a ship, which is calculated to afford the least resistance to the water gliding by it.

We find that, in the year 1769, the earth employed for filling up the space between the walls of the North Bridge in Edinburgh had forced them out, so as to require the

assistance of transverse bars and buttresses for their support. In the more modern bridges, these accidents are prevented by the employment of longitudinal walls for filling up the launches, with flat stones covering the intervals between them, instead of the earth, or the more solid materials which were formerly used, and which produced a greater pressure both on the arch and on the abutments, as well as a transverse thrust against the side walls. For the inclination of the road passing over this bridge, Mr Smeaton thought a slope of one in twelve not too great; observing that horses cannot trot even when the ascent is much more gradual than this, and that if they walk, they can draw a carriage up such a road as this without difficulty; and, indeed, the bridge at Newcastle appears, for a short distance, to have been much steeper. But it has been more lately argued, on another occasion, that it is a great inconvenience in a crowded city to have to lock the wheel of a loaded waggon; that this is necessary at all times on Holborn Hill, where the slope is only one in eighteen; while in frosty weather this street is absolutely impassable for such carriages; and the descent of Ludgate Hill, which is only one in thirty-six, is considered as much more desirable, when it is possible to construct a bridge with an acclivity so gentle.

SECT. V.—*Improvements of the Port of London.*

From the study of Mr Smeaton's diversified labours, we proceed to take a cursory view of the parliamentary inquiry respecting the improvement of the port of London, which has brought forward a variety of important information, and suggested a multiplicity of ingenious designs. The principal part of that which relates to our present subject is contained in the Second and Third Reports from the Select Committee of the House of Commons, on the improvement of the Port of London; ordered to be printed 11th July 1799, and 28th July 1800.

We find in these Reports some interesting details respecting the history of the old London Bridge, which appears to have been begun, not, as Hume tells us, by William Rufus, who was killed in 1100, but in 1176, under Henry II., and to have been completed in eighty-three years. The piles were principally of elm, and remained for six centuries without material decay; although a part of the bridge fell, and was rebuilt about 100 years after it was begun. Rochester, York, and Newcastle Bridges were also built in the twelfth century, as well as the Bridge of St Esprit at Avignon. About the middle of the last century the centre pier of the old London Bridge was removed; the piles were drawn by a very powerful screw, commonly used for lifting the wheels of the water-works; and a single arch was made to occupy the place of two. In consequence of this, the fall was somewhat diminished, and it was necessary partially to obstruct the channel again, in order that the stream should have force enough for the water-works; but it was very difficult to secure the bottom from the effects of the increased velocity under the arch. Several strong beams were firmly fixed across the bed of the river, but only two of them retained their situations for any length of time; and the materials carried away had been deposited below the middle arch, so as to form a shoal, which was only sixteen inches below the surface at low water. The reports contain also much particular information respecting Blackfriars Bridge, the piles for which were driven under water, and cut off level with the bed of the foundations, by a machine of Mr Mylne's invention. The expense of Blackfriars Bridge, including the purchase of premises, was about L.260,000; that of the building only was L.170,000. Westminster Bridge, built in the beginning of the century, cost about L.400,000.

Bridge.

The committee received an immense variety of plans and proposals for docks, wharfs, and bridges; and many of these were published in the Reports, together with engraved details on a very ample scale. They finally adopted three resolutions respecting the rebuilding of London Bridge.

"1. That it is the opinion of this committee that it is essential to the improvement and accommodation of the port of London, that London Bridge should be rebuilt upon such a construction as to permit a free passage, at all times of the tide, for ships of such a tonnage, at least, as the depth of the river would admit of at present between London Bridge and Blackfriars Bridge.

"2. That it is the opinion of this committee that an iron bridge, having its centre arch not less than sixty-five feet high in the clear, above high-water mark, will answer the intended purpose, and at the least expense.

"3. That it is the opinion of this committee that the most convenient situation for the new bridge will be immediately above St Saviour's Church, and upon a line from thence to the Royal Exchange."

In a subsequent Report, ordered to be printed 3d June 1801, we find a plan for a magnificent iron bridge of 600 feet span, which had been submitted to the committee by Messrs Telford and Douglas. Mr Telford's reputation in his profession as an engineer deservedly attracted the attention of the committee; but many practical difficulties having been suggested to them, they circulated a number of queries relating to the proposal, among such persons of science, and professional architects, as were the most likely to have afforded them satisfactory information. But the results of these inquiries are not a little humiliating to the admirers of abstract reasoning and of geometrical evidence; and it would be difficult to find a greater discordance in the most heterodox professions of faith, or in the most capricious variations of taste, than is exhibited in the responses of our most celebrated professors, on almost every point submitted to their consideration. It would be useless to dwell on the numerous errors with which many of the answers abound; but the questions will afford us a very convenient clue for directing our attention to such subjects of deliberation as are really likely to occur in a multiplicity of cases; and it will perhaps be possible to find such answers for all of them as will tend to remove the greater number of the difficulties which have hitherto embarrassed the subject.

QUESTIONS RESPECTING THE CONSTRUCTION OF A CAST-IRON BRIDGE, OF A SINGLE ARCH, 600 FEET IN THE SPAN, AND 65 FEET RISE. (Plate CXXXII. fig. 7.)

QUESTION I. *What parts of the bridge should be considered as wedges, which act on each other by gravity and pressure, and what parts as weight, acting by gravity only, similar to the walls and other loading, usually erected upon the arches of stone bridges? Or does the whole act as one frame of iron, which can only be destroyed by crushing its parts?*

The distribution of the resistance of a bridge may be considered as in some measure optional, since it may be transferred from one part of the structure to another, by wedging together most firmly those parts which we wish to be most materially concerned in it. But there is also a natural principle of adjustment, by which the resistance has a tendency to be thrown where it can best be supported; for the materials being always more or less compressible, a very small change of form, supposed to be equal throughout the structure, will relieve those parts most which are the most strained, and the accommodation will be still more effectual when the parts most

strained undergo the greatest change of form. Thus, if the flatter ribs, seen at the upper part of the proposed structure, supported any material part of its weight, they would undergo a considerable longitudinal compression, and being shortened a little, would naturally descend very rapidly upon the more curved, and consequently stronger parts below, which would soon relieve them from the load improperly allotted to them: the abutment would also give way a little, and be forced out by the greater pressure at its upper part, while the lower part remained almost entirely unchanged.

It is, however, highly important that the work should, in the first instance, be so arranged as best to fulfil the intended purposes, and especially that such parts should have to support the weight as are able to do it with the least expense of lateral thrust, which is the great evil to be dreaded in a work of these gigantic dimensions, the materials themselves being scarcely ever crushed when the arch is of a proper form, and the failure of an iron bridge, by the want of ultimate resistance of its parts to a compressing force, being a thing altogether out of our contemplation; and it is obvious that the greater the curvature of the resting parts, the smaller will be the lateral thrust on the abutments.

We may therefore sufficiently answer this question, by saying that the whole frame of the proposed bridge, so far as it lies in or near the longitudinal direction of the arch, may occasionally co-operate in affording a partial resistance if required; but that the principal part of the force ought to be concentrated in the lower ribs, not far remote from the intrados.

But it is by no means allowable to calculate upon a curve of equilibrium exactly coinciding with the intrados; since, if this supposition were realized, we should lose more than three fourths of the strength of our materials, and all the stability of the joints independent of cohesion, so that the slightest external force might throw the curve beyond the limits of the joint, and cause it to open. Nor can we always consider the curve of equilibrium as parallel to the intrados: taking, for example, the case of a bridge like Blackfriars, the curve of equilibrium, passing near the middle of the arch-stones, is, and ought to be, nine or ten feet above the intrados at the abutment, and only two or three feet at the crown; so that the ordinates of this curve are altogether different from the ordinates which have hitherto been considered by theoretical writers. It may be imagined that this difference is of no great importance in practice; but its amount is much greater than the difference between the theoretical curves of equilibrium, determined by calculation, and the commonest circular or elliptical arches.

With respect to the alternative of comparing the bridge with masonry or with carpentry, we may say, that the principles on which the equilibrium of bridges is calculated are altogether elementary, and independent of any figurative expressions of strains and mechanical purchase, which are employed in considering many of the arrangements of carpentry, and which may indeed, when they are accurately analysed, be resolved into forces opposed and combined in the same manner as the thrusts of a bridge. It is, therefore, wholly unnecessary, when we inquire into the strength of such a fabric, to distinguish the thrusts of masonry from the strains of carpentry, the laws which govern them being not only similar, but identical, except that a strain is commonly understood as implying an exertion of cohesive force; and we have seen that a cohesive force ought never to be called into action in a bridge, since it implies a great and unnecessary sacrifice of the strength of the materials employed. If, indeed, we wanted to cross a mere ditch, without depend-

ing on the firmness of the bank, we might easily find a beam of wood or a bar of iron strong enough to afford a passage over it, unsupported by any abutment, because, in a substance of inconsiderable length, we are sure of having more strength than we require. But to assert that an iron bridge of 600 feet span "is a lever exerting a vertical pressure only on the abutments," is to pronounce a sentence from the lofty tribunal of refined science, which the simplest workman must feel to be erroneous. But in this instance the error is not so much in the comparison with the lever, as in the inattention to the mode of fixing it; for a lever or beam of the dimensions of the proposed bridge, lying loosely on its abutments, would probably be at least a hundred times weaker than if it were firmly connected with the abutments, as a bridge is, so as to be fixed in a determinate direction. And the true reason of the utility of cast iron for building bridges consists not, as has often been supposed, in its capability of being united so as to act like a frame of carpentry, but in the great resistance which it seems to afford to any force tending to crush it.

QUESTION II. *Whether the strength of the arch is affected, and in what manner, by the proposed increase of its width towards the two extremities or abutments, when considered vertically and horizontally. And if so, what form should the bridge gradually acquire?*

The only material advantage derived from widening the bridge at the ends, consists in the firmness of the abutments; and this advantage is greatly diminished by the increase of horizontal thrust which is occasioned by the increase of breadth, while the curve of equilibrium is caused to deviate greatly from a circular or parabolic arc, in consequence of the great inequality of the load on the different parts; and there seems to be no great difficulty in forming a firm connection between a narrow bridge and a wider abutment, without this inconvenience. The lateral strength of the fabric, in resisting any horizontal force, would be amply sufficient, without the dilatation at the ends. Perhaps the form was suggested to the inventor by the recollection of the partial failure of an earlier work of the same kind, which has been found to deviate considerably from the vertical plane in which it was originally situated; but in this instance there seems, if we judge from the engravings which have been published, to have been a total deficiency of oblique braces; and the abutments appear to have been somewhat less firm than could have been desired, since one of them contains an arch and some warehouses, instead of being composed of more solid masonry. (Plate CXXXII. fig. 9.)

QUESTION III. *In what proportions should the weight be distributed from the centre to the abutments, to make the arch uniformly strong?*

This question is so comprehensive, that a complete answer to it would involve the whole theory of bridges; and it will be necessary to limit our investigations to an inquiry whether the structure, represented in the plan, is actually such as to afford a uniform strength, or whether any alterations can be made in it compatible with the general outlines of the proposal, to remedy any imperfections which may be discoverable in the arrangement of the pressure.

There is an oversight in some of the official answers to this question, from quarters of the very first respectability, which requires our particular attention. The weight of the different parts of the bridge has been supposed to differ so materially from that which is required for producing an equilibrium in a circular arch of equable curvature, that it has been thought impossible to apply the principles of the theory in any manner to an arch so constituted, at the same time that the structure is admitted

to be tolerably well calculated to stand when considered as a frame of carpentry. The truth is, that it is by no means absolutely necessary, nor often perfectly practicable, that the mean curve of equilibrium should agree precisely in its form with the curves limiting the external surfaces of the parts bearing the pressure, especially when they are sufficiently extensive to admit of considerable latitude within the limits of their substance. It may happen in many cases that the curve of equilibrium is much flatter in one part, and more convex in another, than the circle which approaches nearest to it; and yet the distance of the two curves may be inconsiderable, in comparison with the thickness of the parts capable of co-operating in the resistance. The great problem, therefore, in all such cases, is to determine the precise situation of the curve of equilibrium in the actual state of the bridge; and when this has been done, the directions of the ribs in the case of an iron bridge, and of the joints of the arch-stones in a stone bridge, may be so regulated as to afford the greatest possible security; and if this security is not deemed sufficient, the whole arrangement must be altered.

Considering the effect of the dilatation at the ends in increasing the load, we may estimate the depth of the materials causing the pressure at the abutments as about three times as great as at the crown; the plan not being sufficiently minute to afford us a more precise determination; and it will be quite accurate enough to take $w = a + bx^2$ (Prop. S.) for the load, w becoming $= 3a$ when x is 300 feet, whence $90,000 = 2a$, and $b = \frac{1}{45,000}a$; we

have then $my = \frac{1}{2}ax^2 + \frac{1}{540,000}ax^4$ for the value of the

ordinate. Now the obliquity to the horizon being inconsiderable, this ordinate will not ultimately be much less than the whole height of the arch, and its greatest value may be called sixty-four feet; consequently, when $x = 300$, we have $64 = \frac{1}{2}a \times 90,000 + \frac{1}{540,000}a \times 90,000$, and the

radius of curvature at the vertex $r = \frac{m}{a} = 937.5$ feet,

while the radius of the intrados is 725 feet, and that of a circle passing through both ends of the curve of equilibrium, as we have supposed them to be situated, 735 feet.

Hence y being $= \frac{1}{1875}x^2 \left(1 + \frac{1}{270000}x^2\right)$, we may calculate the ordinates at different points, and compare them with those of the circular curves.

Distance x .	Versed sine of the intrados.	Versed sine of the circular arc.	Ordinate y .
50.....	1.73.....	1.71.....	1.34
100.....	6.94.....	6.82.....	5.38
150.....	15.66.....	15.43.....	13.00
200.....	28.13.....	27.70.....	24.50
250.....	44.42.....	43.81.....	41.01
300.....	65.00.....	64.00.....	64.00

Hence it appears that, at the distance of 200 feet from the middle, the curve of equilibrium will rise more than three feet above its proper place, requiring a great proportion of the pressure to be transferred to the upper ribs, with a considerable loss of strength, for want of a communication approaching more nearly to the direction of the curve. If we chose to form the lower part of the structure of two series of frames, each about four feet deep, with diagonal braces, we might provide amply for such an irregularity in the distribution of the pressure; but it would be necessary to cast the diagonals as strong as the blocks, in order to avoid the inequality of tension

Bridge. from unequal cooling, which is often a cause of dangerous accidents; it would, however, be much better to have the arch somewhat elliptical in its form, if the load were of necessity such as has been supposed.

QUESTION IV. *What pressure will each part of the bridge receive, supposing it divided into any given number of equal sections, the weight of the middle section being given? And on what parts, and with what force, will the whole act upon the abutments?*

It appears, from the preceding calculations, that the weight of the "middle section" alone is not sufficient for determining the pressure in any part of the fabric; although, when the form of the curve of equilibrium has been found, its radius of curvature at the summit must give at once the length of a similar load equivalent to the lateral thrust; and by combining this thrust with the weight, or with the direction of the curve, the oblique thrust at any part of the arch may be readily found. Thus, since at the abutment $w = a + bx^2 = 3a$, and bx^2

$= 2a$, we have $y = \frac{1}{2} \frac{a}{m} x^2 + \frac{1}{12} \frac{b}{m} x^4$, and $\frac{dy}{dx}$, the tangent

of the inclination becomes $= \frac{a}{m} x + \frac{1}{3} \frac{b}{m} x^3 = \frac{ax}{m} + \frac{2ax}{3m}$

$= \frac{5x}{3r} = \frac{5}{3} \cdot \frac{300}{937.5} = \frac{8}{15} = .5333$; consequently the hori-

zontal thrust will be to the weight of the half arch as fifteen to eight, and to that of the whole arch as fifteen to sixteen. Now the arch is supposed to contain 6500 tons of cast iron, and together with the road will amount, according to Professor Robison's estimate, to 10,100 tons; so that the lateral thrust on each abutment is 9470 tons; and since this is equal to the weight of 937.5 feet in length, of the thickness of the crown, the load there must be about ten tons for each foot of the length. Hence it appears, that although the thrust thus calculated is greater than the weight of a portion of equal length with the apparent radius at the crown, it is less than would be inferred from the angular direction of the intrados at the abutment; the inclination of the termination of the arch being $24^\circ 27'$, while that of the true curve of equilibrium is $28^\circ 4'$; that is, about one tenth greater.

As a further illustration of the utility of this mode of computation, we may take the example of an arch of Blackfriars Bridge. The radius of curvature, as far as four fifths of the breadth, is here fifty-six feet; and we may suppose, without sensible error, the whole load to be that which would be determined by the continuation of the same curve throughout the breadth. Now, the middle of the arch-stones at the distance of fifty feet from the middle of the bridge, that is, immediately over the termination of the abutment, is about twelve feet above that termination, and at the crown about three feet above the intrados, so that we have only thirty-one feet for the extreme value of y , while the whole height of the arch is forty; and a being 6.58 feet, we find (Prop. U.) my

$= 13,510 = 31m$, whence $m = 436$, and $\frac{m}{a} = r = 66\frac{1}{4}$; we

also obtain the values of the ordinates of the curve as in the annexed table.

Distance x .	Ordinate y .	Middle of the Arch-Stones.
10 feet.....	.76.....	.90
20.....	3.12.....	3.72
25.....	5.13.....	6.12
30.....	7.71.....	8.75
40.....	15.81.....	16.81
50.....	31.00.....	31.00

Hence it appears that the greatest deviation is about

thirty feet from the middle, where it amounts to a little more than a foot. But if we suppose this deviation divided by a partial displacement of the curve at its extremities, as it would probably be in reality, even if the resistance were confined to the arch-stones, it would be only about half as great in all three places; and even this deviation will reduce the strength of the stones to two thirds, leaving them, however, still many times stronger than can ever be necessary. The participation of the whole fabric, in supporting a share of the oblique thrust, might make the pressure on the arch-stones somewhat less unequal, and the diminution of their strength less considerable; but it would be better that the pressure should be confined almost entirely to the arch-stones, as tending less to increase the horizontal thrust, which is here compressed by $m = 436$, implying the weight of so many square feet of the longitudinal section of the bridge: while, if we determined it from the curvature of the intrados, it would appear to be only $56a = 368$.

In this calculation, the oblique direction of the joints, as affecting the load, has not been considered; but its effect may be estimated by merely supposing the specific gravity of the materials to be somewhat increased. Thus, since the back of each arch-stone is about one eighth wider than its lower end, the weight of the materials pressing on it will be about one sixteenth greater than would press on it if it were of uniform thickness; and this increase will be very nearly proportional to w , the whole load at each part; so that it will only affect the total magnitude of the thrust, which, instead of 436, must be supposed to amount to about 463. If also great accuracy were required, it would be necessary to appreciate the different specific gravities of the various materials constituting the load, since they are not altogether homogeneous; but so minute a calculation is not necessary in order to show the general distribution of the forces concerned, and the sufficiency of the arrangement for answering all the purposes intended.

QUESTION V. *What additional weight will the bridge sustain, and what will be the effect of a given weight placed upon any of the before-mentioned sections?*

When a weight is placed on any part of a bridge, the curve of equilibrium must change its situation more or less according to the magnitude of the weight; and the tangent of its inclination must now be increased by a quantity proportional to the additional pressure to be supported, which, if the weight were placed in the middle of the arch, would always be equal to half of it; but when the weight is placed at any other part of the arch, if we find the point where the whole thrust is horizontal, the vertical pressure to be supported at each point of the curve must obviously be equal to the weight of the materials interposed between it and this new summit of the curve. Now, in order to find where the thrust is horizontal, we must divide the arch into two such portions, that their difference, acting at the end of a lever of the length of half the span, that is, of the distance from the abutment, may be equivalent to the given weight, acting on a lever equal to its distance from the other abutment, to which it is nearest: consequently this difference must be to the weight as the distance of the weight from the end to half the span; and the distance of the new summit of the curve from the middle must be such, that the weight of materials intercepted between it and the middle shall be to the weight as the distance of the weight from the end to the whole span; and the tangent of the inclination must everywhere be increased or diminished by the tangent of the angle at which the lateral thrust would support the weight of this portion of the materials, except immediately under the weight, where the two portions of the curve

will meet in a finite angle, at least if we suppose the weight to be collected in a single point.

If, for example, a weight of 100 tons, equal to that of about ten feet of the crown of the arch, be placed half-way between the abutment and the middle; then the vertex of the curve, where the thrust is horizontal, will be removed $2\frac{1}{2}$ feet towards the weight; but the radius being 937.5 feet, the tangent of the additional inclination will

be $\frac{2.5}{937.5} = \frac{1}{375}$, and each ordinate of the curve will be in-

creased $\frac{1}{375}$ of the absciss, reckoning from the place of

the weight to the remoter abutment; but between the weight and the nearest abutment the additional pressure at each point will be $10 - 2.5 = 7.5$ feet, consequently

the tangent will be $\frac{1}{125}$, and the additions to the ordi-

nates at the abutments will be $\frac{450}{375}$ and $\frac{150}{125}$, each equal

to $1\frac{1}{3}$ foot, and at the summit $\frac{150}{375} = \frac{2}{5}$, which being de-

ducted, the true addition to the height of the curve will appear to be $\frac{4}{5}$. But the actual height will remain unal-

tered, since the curve is still supposed to be terminated by the abutments, and to pass through the middle of the key-stone; and we have only to reduce all the ordinates in the proportion of 64.8 to 64. Thus, at 200 feet from

the summit, the ordinate, instead of $24.50 + \frac{200}{375} = 25.03$,

will be 24.72, so that the curve will be brought $2\frac{1}{2}$ inches nearer to the intrados, which, in the proposed fabric, would by no means diminish its strength; while, on the opposite

side, immediately under the weight, the ordinate $13 - \frac{150}{375} = 12.6$ will be reduced to 12.45, and the curve rais-

ed between six and seven inches, which is a change by no means to be neglected in considering the resistances required from each part of the structure. We ought also, if great accuracy were required, to determine the effect of such a weight in increasing the lateral thrust, which would affect in a slight degree the result of the calculation; but it would not amount, in the case proposed, to more than one eightieth of the whole thrust.

It is obvious that the tendency of any additional weight, placed near the middle of a bridge, is to straighten the two branches of the curve of equilibrium, and that, if it were supposed infinite, it would convert them into right lines; provided, therefore, that such right lines could be drawn without coming too near the intrados at the haunches, the bridge would be in no danger of giving way, unless either the materials were crushed, or the abutments were forced out. In fact, any bridge well constructed might support a load at least equal to its own weight, with less loss of strength than would arise from some such errors as have not very uncommonly been committed, even in works which have on the whole succeeded tolerably well.

QUESTION VI. *Supposing the bridge executed in the best manner, what horizontal force will it require, when applied to any particular part, to overturn it, or press it out of the vertical plane?*

If the bridge be well tied together, it may be considered as a single mass, standing on its abutments; its mean breadth being about 80 feet, and its weight 10,100 tons; and such a mass would require a lateral pressure at the crown of the arch of about 7000 tons to overset it. Any

strength of attachment to the abutments would, of course, make it still firmer, and any want of connection between the parts weaker; and since the actual resistance to such a force must depend entirely on the strength of the oblique connection between the ribs, it is not easy to define its magnitude with accuracy: but, as Professor Robison has justly remarked, the strength would be increased by causing the braces to extend across the whole breadth of the half arch. The single ribs, if wholly unconnected, might be overset by an inconsiderable force, since they stand in a kind of tottering equilibrium; and something like this appears to have happened to the bridge at Wearmouth. Dr Hutton, indeed, mentions some "diagonal iron bars" in this bridge; but these were perhaps added after its first erection, to obviate the "twisting," which had become apparent, since they are neither exhibited in the large plates of the bridge, nor mentioned in the specification of the patent.

QUESTION VII. *Supposing the span of the arch to remain the same, and to spring ten feet lower, what additional strength would it give the bridge? Or, making the strength the same, what saving may be made in the materials? Or if, instead of a circular arch, as in the plates and drawings, the bridge should be made in the form of an elliptical arch, what would be the difference in effect, as to strength, duration, convenience, and expenses?*

The question seems to suppose the weight of the materials to remain unaltered, and the parts of the structure that would be expanded to be made proportionally lighter; which could not be exactly true, though there might be a compensation in some other parts. Granting, however, the weight to be the same under both circumstances, if the ordinate y at the end be increased in the proportion of sixty-four to about seventy-three, the curvature at the vertex will be increased, and the lateral thrust diminished in the same ratio, the 9470 tons being reduced to 8300. The additional thrust occasioned by any foreign weight would also be lessened, but not the vertical displacement of the curve derived from its pressure; and since the whole fabric might safely be made somewhat lighter, the lightness would again diminish the strain. The very least resistance that can be attributed to a square inch of the section of a block of cast iron is about fifty tons, or somewhat more than 100,000 pounds. It is said, indeed, that Mr William Reynolds found, by accurate experiments, that 400 tons were required to crush a cube of a quarter of an inch of the kind of cast iron called gun-metal, which is equivalent to 6400 tons for a square inch of the section. But this result so far exceeds any thing that could be expected, either from experiment or from analogy, that it would be imprudent to place much reliance on it in practice; the strength attributed to the metal being equivalent to the pressure of a column 2,280,000 feet in height, which would compress it to about four fifths of its length, since the height of the modulus of elasticity (Prop.G.) is about 10,000,000 feet. The greatest cohesive force that has ever been observed in iron or steel does not exceed seventy tons for a square inch of the section, and the repulsive force of a homogeneous substance has not been found in any other instance to be many times greater or less than the cohesive. There cannot, however, be any doubt that the oblique thrust, which amounts to 10,730 tons, would be sufficiently resisted by a section of 215 square inches, or, if we allowed a load amounting to about one third only of the whole strength, by a section of 600 square inches; and since each foot of an iron bar an inch square weighs three pounds, and the whole length of the arch nearly a ton, the 600 square inches would require nearly as many tons to be employed in the ribs affording the resistance, upon this very low estimate

Bridge.

Bridge. of the strength of cast iron. The doubts here expressed respecting Mr Reynolds's results have been fully justified by some hasty experiments, which have been obligingly made by the son of a distinguished architect: he found that two parallelepipeds of cast iron, one eighth of an inch square, and a quarter of an inch long, were crushed by a force of little more than a ton. The experiments were made in a vice, and required considerable reductions for the friction. The mode of calculation may deserve to be explained, on account of its utility on other similar occasions. Supposing the friction to be to the pressure on the screw as 1 to m , and the pressure on the screw to the actual pressure on the substance as n to 1, calling this pressure x , the pressure on the screw will be nx , and the friction $\frac{nx}{m}$; but this resistance will take from the gross

ultimate pressure f a force, which is to the friction itself as the velocity of the parts sliding on each other is to the velocity of the part producing the ultimate pressure, a proportion which we may call p to 1; and the force remaining will be the actual pressure; that is, $f - \frac{pnx}{m} = x$, and

$x = \frac{m}{m + pn} f$. In these experiments, the gross force f , as supposed to be exerted on the iron, was four tons; the friction $\frac{1}{m}$, was probably about $\frac{1}{4}$, the screw not having been lately oiled; the distance of the screw from the centre of motion was to the length of the whole vice as 3 to 4, whence n was $\frac{3}{4}$, and p was 8.44, the middle of the screw describing 4.22 inches, while the check of the vice moved through half an inch: consequently $\frac{m}{m + pn}$ was

$$\frac{4}{4 + 11.25} = \frac{1}{3.81}, \text{ and the corrected pressure becomes } 3.81.$$

In several experiments made with still greater care, and with an improved apparatus of levers, the mean force required to crush a cube of a quarter of an inch was not quite $4\frac{1}{2}$ tons, instead of 400.

Calcareous freestone supports about a ton on a square inch, which is equal to the weight of a column not quite 2000 feet in height: consequently an arch of such freestone, of 2000 feet radius, would be crushed by its own weight only, without any further load; and for an arch like that of a bridge, which has other materials to support, 200 feet is the utmost radius that it has been thought prudent to attempt; although a part of the bridge of Neuilly stands, cracked as it is, with a curvature of 250 feet radius; and there is no doubt that a firm structure, well arranged in the beginning, might safely be made much flatter than this, if there were any necessity for it.

An elliptical arch would certainly approach nearer to the form of the curve of equilibrium, which would remain little altered by the change of that of the arch; and the pressure might be more equably and advantageously transmitted through the blocks of such an arch, than in the proposed form of the structure. The duration would probably be proportional to the increased firmness of the fabric, and the greater flatness at the crown might allow a wider space for the passage of the masts of large ships on each side of the middle. There might be some additional trouble and expense in the formation of portions of an elliptical curve; but even this might be in a great measure avoided by employing portions of three circles of different radii, which would scarcely be distinguishable from the ellipsis itself.

Those who have imagined that a circular arch must in

general be "stronger than an elliptical arch of the same height and span," have not adverted to the distinction between the apparent curvature of the arch, and the situation of the true curve of equilibrium, which depends on the distribution of the weight of the different parts of the bridge, and by no means on the form of the arch-stones only; this form being totally insufficient to determine the true radius of curvature, which is immediately connected with the lateral thrust, and with the strength of the fabric.

QUESTION VIII. *Is it necessary or advisable to have a model made of the proposed bridge, or any part of it, in cast iron. If so, what are the objects to which the experiments should be directed; to the equilibration only, or to the cohesion of the several parts, or to both united, as they will occur in the intended bridge?*

Experiments on the equilibration of the arch would be easy and conclusive; on the cohesion or connection of the parts, extremely uncertain. The form and proportion of the joints could scarcely be imitated with sufficient accuracy; and since the strength of some of the parts concerned would vary as the thickness simply, and that of others as the square or cube of the thickness, it would be more difficult to argue from the strength of the model upon that of the bridge, than to calculate the whole from still more elementary experiments. Some such experiments ought, however, to be made on the force required to crush a block of the substance employed; and the form calculated to afford the proper equilibrium might be very precisely and elegantly determined, by means of the method first suggested by Dr Hooke, that of substituting for the blocks, resting on each other and on the abutments, as many similar pieces forming a chain, and suspended at the extremities. It would, however, be important to make one alteration in the common mode of performing this experiment, without which it would be of little or no value; the parts corresponding to the blocks of the arch should be formed of their proper thickness and length, and connected with each other and with the abutments by a short joint or hinge in the middle of each, allowing room for a slight degree of angular motion only; and every other part of the structure should be represented in its proper form and proportion and connection, that form being previously determined as nearly as possible by calculation; and then, if the curve underwent no material alteration by the suspension, we should be sure that the calculation was sufficiently correct; or, if otherwise, the arrangement of the materials might be altered, until the required curve should be obtained; and the investigation might be facilitated by allowing the joints or hinges connecting the block to slide a little along their surfaces, within such limits as would be allowable, without too great a reduction of the powers of resistance of the blocks.

QUESTION IX. *Of what size ought the model to be made, and what relative proportions will experiments made on the model bear to the bridge when executed?*

The size is of little importance, and it would be unsafe to calculate the strength of the bridge from any general comparison with that of the model. There is an Essay of Euler in the *New Commentaries of the Royal Academy of Petersburg* (vol. xx. p. 271), relating expressly to the mode of judging of the strength of a bridge from a model; but it contains only an elementary calculation, applicable to ropes and simple levers, and by no means comprehending all the circumstances that require to be considered in the structure of an arch.

QUESTION X. *By what means may ships be best directed in the middle stream, or prevented from driving to the side, and striking the arch? and what would be the consequence of such a stroke?*

Bridge.

For the direction of ships, Professor Robison's suggestion seems the simplest and best, that they might be guided by means of a small anchor, dragged along the bottom of the river. The stroke of a ship might fracture the outer ribs if they were too weak, but could scarcely affect the whole fabric in any material degree, supposing it to be firmly secured by oblique bars, crossing from one side of the abutment to the other side of the middle; and if still greater firmness were wanted, the braces might cross still more obliquely, and be repeated from space to space.

A ship moving with a velocity of three miles in an hour, or about four feet in a second, would be stopped by a force equal to her weight when she had advanced three inches with a retarded motion; and the bridge could not very easily withstand, at any one point, a force much greater than such a shock of a large ship, if it were direct, without being dangerously strained. But we must consider that a large ship could never strike the bridge with its full force, and that the mast would be much more easily broken than the bridge. The inertia of the parts of the bridge, and of the heavy materials laid on it, would enable it to resist the stroke of a small mass with great mechanical advantage. Thus the inertia of an anvil laid on a man's chest enables him to support a blow on the anvil, which would be fatal without such an interposition, the momentum communicated to the greater weight being always less than twice the momentum of the smaller, and this small increase of momentum being attended by a much greater decrease of energy or impetus, which is expressed by the product of the mass into the square of the velocity, and which is sometimes called the ascending or penetrating force, since the height of ascent or depth of penetration is proportional to it when the resistance is given. And the same mode of reasoning is applicable to any weight falling on the bridge, or to any other cause of vibration, which is not likely to call forth in such a fabric any violent exertion of the strength of the parts, or of their connections. We must also remember, in appreciating the effect of a stroke of any kind on an arched structure, that something of strength is always lost by too great stiffness; the property of resisting velocity, which has sometimes been called resilience, being generally diminished by any increase of stiffness, if the strength, with respect to pressure, remains the same.

QUESTION XI. *The weight and lateral pressure of the bridge being given, can abutments be made in the proposed situation for London Bridge, to resist that pressure?*

Since this question relates entirely to the local circumstances of the banks of the Thames, the persons to whom it has been referred have generally appealed to the stability of St Saviour's Church, in a neighbouring situation, as a proof of the affirmative; and it does not appear that there have been any instances of a failure of piles well driven, in a moderately favourable soil. Professor Robison, indeed, asserts that the firmest piling will yield in time to a pressure continued without interruption; but a consideration of the general nature of friction and lateral adhesion, as well as the experience of ages in a multitude of structures actually erected, will not allow us to adopt the assertion as universally true. When, indeed, the earth is extremely soft, it would be advisable to unite it into one mass for a large extent, perhaps as far as 100 yards in every direction, for such a bridge as that under discussion, by beams radiating from the abutments, and resting on short piles, with cross pieces interspersed; since we might combine, in this manner, the effect of a weight of 100,000 tons, which could scarcely ever produce a lateral adhesion of less than 20,000, even if the materials were semifluid; for they would afford this resistance if they were capable of standing in the form of a bank, rising only

Bridge.

one foot in five of horizontal extent, which anything short of an absolute quicksand or a bog would certainly do in perfect security. The proper direction of the joints of the masonry may be determined for the abutment exactly as for the bridge, the tangent of the inclination being always increased in proportion to the weights of the successive wedges added to the load; and the ultimate inclination of the curve is that in which the piles ought to be driven, being the direction of the result, composed of the lateral thrust, together with the joint weight of the half bridge and the abutment.

QUESTION XII. *The weight and lateral pressure of the bridge being given, can a centre or scaffolding be erected over the river, sufficient to carry the arch, without obstructing the vessels which at present navigate that part?*

There seems to be no great difficulty in the construction of such a centre. When the bridge at Wearmouth was erected, the centre was supported by piles and standards, which suffered ships to pass between them without interruption; and a similar arrangement might be made in the present case with equal facility.

QUESTION XIII. *Whether would it be most advisable to make the bridge of cast and wrought iron combined, or of cast iron only? And if of the latter, whether of the hard white metal, or of the soft gray metal, or of gun metal?*

A bridge well built ought to require no cohesive strength of ties, as Mr Southern has justly observed in his answer to the eighth question; and for repulsive resistance, in the capacity of a shore, cast iron is probably much stronger than wrought iron; and it has also the advantage of being less liable to rust, and of expanding somewhat less by heat. But wherever any transverse strain is unavoidable, wrought iron possesses some advantages, and it is generally most convenient for bolts and other fastenings. The kind of iron called gun metal is decidedly preferred by the most experienced judges, as combining in the greatest degree the properties of hardness and toughness; the white being considered as too brittle, and the gray as too soft. Dr Hutton, however, and Mr Jessop, prefer the gray; and if we allow the strength of the gun metal to be at all comparable to that which Mr Reynolds attributes to it, we must also acknowledge that a much weaker substance would be amply sufficient for every practical purpose, and might deserve to be preferred, if it were found to possess a greater degree of tenacity.

QUESTION XIV. *Of what dimensions ought the several members of the iron work to be, to give the bridge sufficient strength?*

See the answers to Questions VII. and XI.

QUESTION XV. *Can frames of cast iron be made sufficiently correct to compose an arch of the form and dimensions shown in the drawings, so as to take an equal bearing as one frame, the several parts being connected by diagonal braces, and joined by an iron cement, or other substance?*

Professor Robison considers it as indispensable that the frames of cast iron should be ground to fit each other; and a very accurate adjustment of the surface would certainly be necessary for the perfect co-operation of every part of so hard a substance. Probably, indeed, any very small interstices that might be left would in some measure be filled up by degrees, in consequence of the oxidation of the metal, but scarcely soon enough to assist in bearing the general thrust upon the first completion of the bridge. The plan of mortising the frames together is by no means to be advised, as rendering it very difficult to adapt the surfaces to each other throughout any considerable part of their extent. They might be connected either, as in the bridge at Wearmouth, by bars of wrought iron let into the slides, which might be of extremely moderate dimensions, or, as in some still more modern fabrics, by

Bridge.

being wedged into the grooves of cross plates adapted to receive them, which very effectually secure the co-operation of the whole force of the blocks, and which have the advantage of employing cast iron only.

QUESTION XVI. *Instead of casting the ribs in frames of considerable length and breadth, would it be more advisable to cast each member of the ribs in separate pieces of considerable lengths, connecting them together by diagonal braces, both horizontally and vertically?*

No joint can possibly be so strong as a single sound piece of the same metal; and it is highly desirable that the curve of pressure should pass through very substantial frames or blocks, abutting fully on each other, without any reliance on lateral joints; but for the upper parts of the works, single ribs, much lighter than those which form the true arch, would be sufficiently firm.

QUESTION XVII. *Can an iron cement be made which shall become hard and durable, or can liquid iron be poured into the joints?*

Mr Reynolds has observed that a cement composed of iron borings and saline substances will become extremely hard; and it is probable that this property depends on the solidity which is produced by the gradual oxidation of the iron. It would certainly be injurious to the strength of the fabric to interpose this cement between perfectly smooth and solid surfaces, but it might be of advantage to fill up with it any small interstices unavoidably left between the parts. To pour melted iron into the joints would be utterly impracticable.

QUESTION XVIII. *Would lead be better to use in the whole or any part of the joints?*

Lead is by far too soft to be of the least use, and a saline cement would be decidedly preferable.

QUESTION XIX. *Can any improvement be made in the plan, so as to render it more substantial and durable, and less expensive? And if so, what are these improvements?*

The most necessary alterations appear to be the omission of the upper and flatter ribs; the greater strength and solidity of the lower, made either in the form of blocks or of frames with diagonals; a curvature more nearly approaching to that of the curve of equilibrium; and a greater obliquity of the cross braces.

It would be necessary to wedge the whole structure very firmly together before the removal of the centres; a precaution which is still more necessary for stone bridges, in which a certain portion of soft mortar must inevitably be employed, in order to enable the stones to bear fully on each other, and which has been very properly adopted in the best modern works. In this manner we may avoid the inconvenience pointed out by Professor Robison, who has remarked, that the compressibility of the materials, hard as they appear, would occasion a reduction of three inches in the length of the bridge, from the effect of the lateral thrust, and a consequent fall at the crown of fifteen; a result which will not be found materially erroneous if the calculation be repeated from more correct elements, derived from later experiments and comparisons. For obviating the disadvantageous effects of such a depression, which he seems to have supposed unavoidable, as well as those of a change of temperature, which must in reality occur, though to a less considerable extent, Professor Robison suggested the expedient of a joint to the middle of the bridge, with an intermediate portion, calculated to receive the rounded ends of the opposite ribs, somewhat like an interarticular cartilage; but it is impossible to devise any kind of joint without limiting the pressure, during the change of form, to a very small portion of the surfaces, which could not bear fully on each other throughout their extent if any such liberty of motion were allowed, unless all friction between them were prevented; and a

similar joint would be required at the abutment, where it would be still more objectionable, as extending to a wider surface.

The arrangement of the joints between the portions of the ribs in one or more transverse lines would be a matter of great indifference. Some have recommended to break the joints, as is usual in masonry, in order to tie the parts more firmly together; others to make all the joints continuous, as a safer method, on account of the brittleness of the materials; but if the fabric were well put together, there would be neither any want of firm connection, nor any danger of breaking from irregular strains, in whatever way the joints may be disposed.

QUESTION XX. *Upon considering the whole circumstances of the case, agreeably to the resolutions of the committee, as stated at the conclusion of their third report, is it your opinion that an arch of 600 feet in the span, as expressed in the drawings produced by Messrs Telford and Douglas, or the same plan, with any improvement you may be so good as to point out, is practicable and advisable, and capable of being made a durable edifice?*

The answers that have been returned to this question are almost universally in the affirmative, though deduced from very discordant and inconsistent views of the subject. The only reasonable doubt relates to the abutments; and with the precautions which have been already mentioned in the answer to the 11th question, there would be no insuperable difficulty in making the abutments sufficiently firm.

QUESTION XXI. *Does the estimate communicated herewith, according to your judgment, greatly exceed, or fall short of, the probable expense of executing the plan proposed? specifying the general grounds of your opinion.*

The estimate amounts to L.262,289, and it has generally been considered as below the probable expense. The abutments are set down at L.20,000, but they would very possibly require five times as much to be properly executed; while some other parts of the work, by a more judicious distribution of the forces concerned, might safely be made so much lighter, as considerably to lessen the expense of the whole fabric, without any diminution either of its beauty or of its stability.

SECT. VI.—Modern History of Bridges.

The whole series of the questions which we have been considering are still fully as interesting as they were at the time when they were circulated by the committee of the House of Commons. The practice of building iron bridges has been progressively gaining ground ever since its first introduction in 1779 by Mr Abiah Darby of Colebrook Dale. Mr Wilson, indeed, who assisted Mr Burdon in the erection of the bridge at Wearmouth, mentions in his answers an iron bridge which has stood secure for ninety years; but it must have been on a very small scale, and has not been at all generally known. Of most of the later iron bridges we find a concise account in Dr Hutton's elaborate Essay on Bridges, which has been reprinted in the first volume of his valuable collection of tracts; but there are some still greater edifices of this kind which still remain to be completed.

Mr Darby's construction is not remarkably elegant (Plate CXXXII. fig. 8), but it is by no means so objectionable as several late authors have seemed to think it. The span is 100 feet six inches, the weight 178½ tons. The curvature of the exterior concentric arches which assist in supporting the roadway, though it may be somewhat too great for the most favourable exertion of their resistance, leaves them still abundantly strong for the purpose intended: nor is it correct to say that every shore supporting a

pressure should be straight; for if its own weight bears any considerable proportion to that which it has to support, the curvature ought to be the same with that of a chain of the same weight suspending a similar load in an inverted position; and the parts of the bridge in question seem to differ only about as much from such a form in excess of curvature as a straight line would differ from it in defect. The partial failure which accidentally occurred rather bears testimony to the merits than to the demerits of the bridge, as they would be estimated in any other situation; for the lateral thrust, which it is generally desirable to reduce as much as possible, was here actually too small; and the abutments were forced inwards by the external pressure of the loose materials forming the high banks against which the abutments rested.

Mr Paine's iron bridge, exhibited in London, and intended to have been erected in America, was a professed imitation of a catenarian curve; it was a good specimen of that ideal something which a popular reformer generally has in view; a thing not ill imagined, and which might possibly succeed very well under very different circumstances, but which, when closely examined, proves to be wholly unfit for the immediate purpose to which the inventor intends to apply it.

The bridge at Wearmouth was completed in 1796, in a great measure through the exertions of Mr Burdon, both as architect and as principal proprietor of the undertaking. It is remarkable for springing seventy feet above low-water mark; and the arch rises thirty feet, leaving a height of 100 feet in the whole for the passage of ships in the middle of the stream; the span is 240. The abutments are founded on a solid rock, but their own internal solidity appears to be somewhat deficient. The weight of iron is 250 tons, 210 of them being of cast iron, and 40 of wrought iron. (Plate CXXXII. fig. 9.)

A bridge was finished in the same year at Buildwas, near Colebrook Dale (Plate CXXXII. fig. 10), under the direction of Mr Telford, 130 feet in span, weighing 174 tons, and rising only seventeen feet in the roadway, but furnished on each side with a stronger arch, of about twice the depth, which extends to the top of the railing, and assists in suspending the part of the road which is below it by means of king-posts, and in supporting the part nearer the abutments by braces and shores. The breadth is only eighteen feet; and the construction would not be so easily applicable to a wider bridge, unless the road were divided in the middle by an additional elevated arch with its king-posts, like the celebrated wooden bridge at Schaffhausen, which was burnt down by one of the French armies. A third iron bridge was also erected in 1796, on the Parrot at Bridgewater, by the Colebrook Dale Company. It consists of an elliptic arch of seventy-five feet span and twenty-three feet height, and somewhat resembles the bridge at Wearmouth in the mode of filling the haunches with circular rings; a mode not very advantageous for obtaining the greatest possible resistance from the materials, and consequently throwing a little too much weight on the parts of the arch which support them, although it is probable that no great inconvenience has actually arisen from this cause.

An attempt was also made about the same time to throw an iron bridge over the river Tame in Herefordshire, but it fell to pieces as soon as the centre was removed. A similar failure occurred some time afterwards in a bridge of about 180 feet span, which was erected on the Tees at Yarm. In 1802 or 1803 an elegant iron bridge of 181 feet span and sixteen and a half of rise was erected at Staines. Its general form resembled that of the bridge at Wearmouth, but the mode of connection of the parts was somewhat different. In a short time after its completion,

it began to sink, and some of the transverse pieces broke in consequence of the change of form. Upon examination it was found that one of the abutments had given way; and when this was repaired and made firmer, the other failed. The abutment was pushed outwards horizontally without any material derangement of its form or direction; a circumstance which could not have happened if its weight had been sufficiently great. But the architect seems to have trusted to the firmness of the iron and the excellence of the workmanship, and to have neglected the calculation of the lateral thrust, which it is of so much importance to determine.

Mr Rennie executed several iron bridges with success in Lincolnshire; one at Boston over the Witham, of which the span is eighty-six feet, and the rise five and a half only; but the abutments being well constructed, it has stood securely, notwithstanding the fracture of some of the cross pieces of the frames, which had been weakened by the unequal contraction of the metal in cooling. At Bristol, Messrs Jessop erected two iron bridges of 100 feet span, rising fifteen; each of them contains 150 tons of gray iron, and the expense of each was about L.4000. The construction appears to be simple and judicious. (Plate CXXXII. fig. 11.)

Mr Telford has been employed in the construction of several aqueduct bridges on a considerable scale. One of these was cast by Messrs Reynolds, and completed in 1796, near Wellington in Shropshire; it is 180 feet long, and twenty feet above the water of the river, being supported on iron pillars. Another, still larger, was cast by Mr Hazledine, for carrying the Ellesmere Canal over the river Dee, at Pontcysyllte, in the neighbourhood of Llangollen. It is supported 126 feet above the surface of the river by twenty stone pillars, and is 1020 feet in length, and twelve feet wide. (See AQUEDUCT, Plate XLIX.)

In France, a light iron bridge for foot passengers only was thrown across the Seine, opposite to the gate of the Louvre, in 1803. It is supported by stone piers, which are too narrow to withstand the effect of an accident happening to any part of the fabric, and leaving the lateral thrust uncompensated; nor is there any immediate reason to apprehend that inconvenience should arise from this deficiency of strength, since it is highly improbable that any partial failure should occur in such a situation, supposing the bridge originally well constructed. (Plate CXXXIII. fig. 1.)

But all these works have been far exceeded in extent and importance by the bridges which have been built over the river Thames. The Vauxhall Bridge was completed and opened in August 1816; it consists of nine arches of cast iron, each of seventy-eight feet span, and between eleven and twelve feet rise. The breadth of the roadway is thirty-six feet clear. The architect was Mr Walker. The form of the arches considerably resembles that of Messrs Jessop's bridges at Bristol, but it is somewhat lighter and more elegant, and it has the advantage of a greater solidity in the blocks supporting the principal part of the pressure. (Plate CXXXIII. fig. 3.)

This advantage also characterizes very strongly the masterly design of Mr Rennie shown in the structure at the bottom of Queen Street, Cheapside, opposite to Guildhall, under the name of the Southwark Bridge. It exhibits an excellent specimen of firmness of mutual abutment in the parts constituting the chief strength of the arch, which has been shown in this essay to be so essential to the security of the work, and which the architect had probably been in a great measure induced to adopt from his practical experience of the comparative merits of different arrangements. (Plate CXXXIII. fig. 4, 5.)

An act of parliament for the erection of this bridge was

Bridge.

Bridge.

passed in 1811, but it was not begun till 1814, the act having directed that no operations should be commenced until L.300,000 out of the required L.400,000 should be raised by subscription.¹ The subscribers were allowed to receive ten per cent. annually on their shares, and the remainder of the receipts was to accumulate until it should become sufficient to pay off to the proprietors the double amount of their subscriptions: after this time the bridge was to remain open without any toll. The middle arch is 240 feet in span, the side arches 210 feet each. The abutment is of firm masonry, connected by dowels to prevent its sliding, and resting on gratings of timber supported by oblique piles. The piers stand on foundations nine or ten feet below the present bed of the river, in order to provide against any alterations which may hereafter take place in its channel from the operation of various causes; and they are abundantly secured by a flooring of timber resting on a great number of piles.

 Abutment..... 11,000 0
 Span 240 feet; rise 24; depth of the blocks or plates at the crown six feet, at the pier eight feet.

It is evident from the inspection of this statement of the weights, that their distribution is by no means capable of being accurately expressed by any one formula; but it will be amply sufficient for the determination of the thrust to employ the approximation founded on the supposition of a parabolic curve (Prop. T.); and if we afterwards wished to find the effect of any local deviation from the assumed law of the weight, we might have recourse to the mode of calculation exemplified in the answer to the fifth question. But, in fact, that answer may of itself be considered as sufficient to show, that the effect of a variation of a few tons from the load appropriate to each part would be wholly unimportant.

We must, therefore, begin by finding the weight of a portion of the arch corresponding to a quarter of the span;

and the whole angle, of which the tangent is $\frac{24}{120} = .2$,

being $11^\circ 18\frac{1}{2}'$, its sine is .1961; and the angle, of which the sine is .09805, being $5^\circ 37\frac{1}{2}'$, we have to compute the weight of $\frac{337.5}{678.5}$, or $\frac{1}{2.01}$ of the angular extent, beginning

from the middle of the arch; and this will be $48 \frac{1}{20} + 88 \frac{6}{20} + 95 \frac{12}{20} + (87 \frac{6}{20}) \times .7345 = 297$ tons. Now the weight of the covering-plates, cornice, palisades, roadway, and pavement, is distributed throughout the length, without sensible inequality, making 879 tons, from which the part immediately above the piers might be deducted;

but it will be safer to retain the whole weight, especially as something must be allowed for the greater extent of the upper surface of the wedges. We shall therefore have for the interior quarter $297 + 439.5 = 736.5$ tons, and for the exterior $1523 - 736.5 = 786.5$, the difference being fifty tons; one sixth of which added to 736.5, gives us 744.8 for the reduced weight, which is to the lateral thrust as the rise to the half span. But for the rise we must take twenty-three feet, since the middle of the blocks next to the piers is a foot more remote from the intrados than that of the blocks at the crown; and the true half span, measured from the same point, will be 4

$\times \frac{120}{312}$ greater than that of the intrados, amounting to 121.6. We have therefore $23 : 121.6 = 745.8 : 3942$ tons, for m , the lateral thrust; and for $\frac{1}{2} ax$, $736.5 - \frac{50}{6}$

$= 728.2$; whence, $\frac{1}{2} x$ being 60.8, $a = 11.98$, and r

$= \frac{m}{a} = 329$ feet, the radius of curvature of the curve of

equilibrium at the vertex, while that of the middle of the blocks is 334. In order to determine the ordinate y , we

have $my = \frac{1}{2} ax^2 + \frac{1}{12} bx^4$; but $\frac{1}{2} ax$ for the whole arch is

728.2 , and $\frac{1}{4} bx^3 = 50$; consequently $my = 728.2x + \frac{50}{3} x$,

the first portion varying as x^2 , and the second as x^4 ; and

the sum y being $23 = 22.49 + .51$, the ordinate at $\frac{1}{4} x$ or

30.4 feet is $\frac{1}{16} \times 22.49 + \frac{1}{256} \times .51 = 1.41$; and, in a

similar manner, any other ordinate may be calculated, so that we have

x .	y .	Middle of the Blocks.
30.2	1.41	1.40
60.8	5.65	5.67
91.0	13.02	12.89
121.6	23.00	23.00

Hence it appears that the curve of equilibrium nowhere deviates more than about two inches from the middle of the blocks, which is less than one fortieth of the whole depth.

The half weight of the smaller arches is probably about 1300 tons, and their lateral thrust 3500; and, since the abutment weighs 11,000 tons, the foundation ought to

have an obliquity of $\frac{3500}{12300}$, or more than one in four, if it

were intended to stand on the piles without friction; but in reality it rises only sixty-six inches in 624, or nearly one in nine; so that there is an angular difference of one in seven between the direction of the piles and that of the thrust, which is probably a deviation of no practical importance.

It remains to be inquired how far the series of masses of solid iron, constituting the most essential part of the arch, is well calculated to withstand the utmost changes of temperature that can possibly occur to it in the severest seasons (Prop. K.) For this purpose, we may take

the mean depth $a = 7$ feet, h being 23; then $1 + \frac{4h}{a}$

$= \frac{99}{7} = 14.14$, and $1 + \frac{16hh}{15aa} = \frac{9199}{735} = 12.52$: consequent-

¹ The Southwark Bridge was not completed at the time this article was written.

ly the greatest actual compression or extension of such a structure is to the mean change which takes place in the direction of the chord, as 14.14 to 12.52, or as 1.129 to one; and if, in a long and severe frost, the temperature varied from 52° to 20°, since the general dimensions would con-

tract about $\frac{1}{5000}$, the extreme parts of the blocks near the

abutments would vary $\frac{1.129}{5000}$ of their length; and the mo-

dulus M being about 10,000,000 feet, this change would produce a resistance equivalent to the weight of a column of the same substance 2258 feet high; that is, to about three tons for each square inch, diminishing gradually towards the middle of the blocks, and converted on the other side into an opposite resistance; so that this force would be added to the general pressure below in case of contraction, and above in case of extension. Now, the lateral thrust is derived from a pressure equivalent to a column about 329 feet high, of materials weighing 1523 tons, while the blocks themselves weigh 357; that is, to a column equal in section to the blocks, and 1400 feet high; it will therefore amount to about two tons on each square inch; consequently such a change of temperature as has been supposed, will cause the extreme parts of the abutments to bear a pressure of five tons, where, in the ordinary circumstances, they have only to support two.

The ingenious architect proposed to diminish this contingent inconvenience, by causing the blocks to bear somewhat more strongly on the abutments at the middle than at the sides, so as to allow some little latitude of elevation and depression in the nature of a joint; and, no doubt, this expedient would prevent the great inequality of pressure which might otherwise arise from the alternations of heat and cold. But it cannot be denied that there must be some waste of strength in such an arrangement, the extreme parts of the abutments, and of the blocks near them, contributing very little to the general resistance; and when we consider the very accurate adjustment of the equilibrium throughout the whole structure, we shall be convinced that there was no necessity for any thing like so great a depth of the solid blocks, especially near the abutments; and that the security would have been amply sufficient if, with the same weight of metal, they had been made wider in a transverse direction, preserving only the form of the exterior ones on each side, if it had been thought more agreeable to the eye. In carpentry, where there is often a transverse strain, and where stiffness is frequently required, we generally gain immensely by throwing much of the substance of our beams into the depth; but in a bridge perfectly well balanced, there is no advantage whatever from depth of the blocks. We only want enough to secure us against accidental errors of construction, and against partial loads from extraneous weights; and it is not probable that either of these causes, in such a bridge, would ever bring the curve of equilibrium six inches, or even three, from its natural situation near the middle of the blocks.

We cannot conclude our inquiries into this subject with a more striking example than by applying the principles of the theory to the magnificent edifice by the same judicious and experienced architect, which now bears the triumphant appellation of Waterloo Bridge; a work not less pre-eminent among the bridges of all ages and countries, than the event which it will commemorate is unrivalled in the annals of ancient or modern history. It consists of nine elliptical arches, each of 120 feet span, and thirty-five feet rise. The piers are twenty feet thick, the road twenty-eight feet wide, besides a foot pavement of seven feet on each side. The arches and piers are built of large

blocks of granite, with short counter-arches over each pier. The haunches are filled up, as is usual in the most modern bridges, by spandrels, or longitudinal walls of brick, covered with flat stones, and extending over about half the span of the arch; the remainder being merely covered with earth or gravel, which is also continued over the stones covering the spandrels. The hollow spaces between the walls are carefully closed above, and provided with outlets below, in order to secure them from becoming receptacles of water, which would be injurious to the durability of the structure. The mean specific gravity of the materials is such, that a cubic yard of the granite weighs exactly two tons, of the brick work one ton, and of the earth a ton and an eighth. Hence the weight of the whole may be obtained from the annexed statement. (Plate CXXXIV. fig. 1, 2, 3.)

Contents of the materials in half an arch of Waterloo Bridge, from the middle of the pier to the crown, beginning from the springing of the arch.

	Cubic Feet.
Half of the arch stones.....	25311
Half of the inverted arch.....	2555
Square spandrel between them.....	1994
Outside spandrel walls.....	4374
Spandrels of brick.....	4976 (= 2489)
Kirbels of the brick spandrels.....	1271
Flat stone covers.....	969
Earth.....	10260 (= 5771)
Foot pavement.....	620
Frieses, E. and W.....	1586
Cornice, E. and W.....	1120
Plinth of balustrade.....	510
Solid in parapet.....	416
Balusters 72, 151 cwt.....	102
Coping, E. and W.....	142

From this statement, and from a consideration of the arrangement of the materials, exhibited in the plate, we may infer that the half arch, terminated where the middle line of the arch-stones enters the pier, is equivalent in weight to about 34,000 cubic feet of granite; its inner half containing in round numbers 13,000, and its outer 21,000, whence we have 14,333 for the reduced weight of the quarter arch (Prop. T.) The extreme ordinate will be about twenty-one feet; the middle of the blocks being somewhat more than sixteen feet above the springing of the arch, and the key-stone being four feet six inches deep; consequently the horizontal thrust will be expressed by $14,333 \times \frac{60}{21} = 40,952$ cubic feet, weighing 3033

tons. But $\frac{1}{2}ax$ being 11667, and $\frac{1}{2}x = 30$, $a = 389$, and

$\frac{m}{a} = r = \frac{40952}{388} = 105$ feet; while the radius of curva-

ture of the ellipse at the crown is $\frac{60 \times 60}{35} = 103$ feet.

It is obvious, therefore, that the curve of equilibrium will pass everywhere extremely near to the middle of the blocks, and there can be no apprehension of any deficiency in the equilibrium. It is true that, as it approaches to the piers, it acquires an obliquity of a few degrees to the joints; but the disposition to slide would be abundantly obviated by the friction alone, even if the joints were not secured by other precautions.

In building the arches the stones were rammed together with very considerable force, so that, upon the removal of the centres, none of the arches sunk more than an inch and a half. In short, the accuracy of the whole

Bridge. execution seems to have vied with the beauty of the design, and with the skill of the arrangement, to render the Bridge of Waterloo a monument, of which the metropolis of the British empire will have abundant reason to be proud for a long series of successive ages. (L. L.)

ADDITIONS.¹

The old London Bridge, which for more than 600 years had been exposed to the corrosive power of the atmosphere in the upper part of its structure, and the continual action of a rapid current in the lower, had for several years been reckoned insecure. Accidents, attended with loss of life and the destruction of property, were frequent, in consequence of the great velocity with which barges and smaller craft were carried by the stream through its arches, and of their descent, by means of a considerable fall, from one level to another. At length, in 1823, an act of parliament was obtained for rebuilding the bridge and improving and making suitable approaches to it. The act directed that the new bridge should be erected according to a plan of the late John Rennie, justly celebrated for his consummate skill in his profession. He, however, having died before any thing had been done to carry his views into effect, the execution was intrusted to his son, now Sir John Rennie, and the building contracted for by Messrs Jolliffe and Banks.

The new bridge, consisting of five elliptical arches, was originally intended to be on the site of the old one, and its elevation was to correspond with the level of the ancient approaches. The corporation of London, however, changed this part of the plan, and determined that it should be built 180 feet farther up the river, by which the steep ascent of Fish Street Hill would be avoided; but this advantage was counterbalanced by a heavy expense for the approaches. The whole expense of the bridge, with its approaches, may cost about L.2,000,000; and of this sum L.200,000 was to be contributed by the government.

The building was begun by driving the first pile of a coffer-dam for the south pier on the 15th of March 1824. The bed of the river at the site of the bridge is about thirty feet deep at low water of spring-tides, and the current being at all times extremely rapid, the coffer-dams in which the piers were to be built, required to be constructed with more than ordinary strength to keep out the water. Their general form was elliptical; three rows of piles dressed in the joints, and shod with iron, many of them eighty or ninety feet long, were driven into the ground, and, after being firmly bolted together, were puddled with clay; wooden stays or props were then introduced between the different rows of piers, and the whole interior space strongly truss-framed in a diagonal manner, and the longitudinal beams firmly strapped together, forming at the joints abutments for the braces. Stairs were also formed for descending into the coffer-dam, and pumps fixed to raise the water arising from springs or leakage. The first coffer-dam was completed on the 27th of April 1825, and the first stone of the bridge was laid on the 15th of June, with all due ceremony. The foundations of the piers are of wood. Piles of beech were first driven in the interior of the coffer-dam to a depth of nearly twenty feet into the stiff blue clay which forms the natural bed of the river; two rows of horizontal sleepers, about twelve inches square, were then laid on the head of these piles, and covered with beech planking six inches thick, and on this floor the lowermost course of masonry was laid.

The obstruction which the navigation of the river suf-

fered by the works of the new bridge made it expedient to throw two of the small arches of the old bridge at each end into one. This was effected with great skill, and in the short space of about six weeks.

The flatness of an elliptical arch produces a greater load on the centring which supports the arch while building, than in the erection of semicircular arches; and for this reason the new bridge required centres of more than ordinary strength. The principle of construction adopted was that of the diagonal truss. Each centre was composed of ten frames or ribs, which were supported at the two ends on piles driven into the bed of the river. On the top, these frames were boarded over with stout planks placed within two or three inches of each other. The arches being unequally wide, four sets of centres were used; and although each consisted of nearly 800 tons of timber, it was erected in about ten days. The first arch was keyed in on the 4th of August 1827; and so much progress had been made in the other arches, that the last was keyed in on the 10th November 1828. Conformably to the improved modern practice of building bridges, instead of filling up the spandrels of the arches with loose rubble-work, longitudinal or hance-walls, as they are called, have been built over the arches. On the top of these large blocks of stone are bedded, and surmounted by heavy stone landings, on which is laid a course of tarras or cement, and above that the roadway. The approach from the city side is brought to the level of the bridge, or nearly so, by a series of land arches in continuation of the bridge, and more particularly by one over Tooley Street on the Surrey side, and another over Thames Street on the city side. This arch is a very flat ellipse; it extends over both the roadway and foot paths. The centre on which it was turned was almost entirely supported on struts and uprights, placed so as to range with the lines of the foot paths; and thus a free space was left for carriages and foot passengers while the arch was building.

The only deviation in the principal part of the bridge from the original plan consisted in an addition of six feet to the width of the roadway, and of two feet to the height of the abutment arches. The first of these was considered to be of such importance, that the expense, L.42,000, was defrayed out of the public purse.

The bridge was completed on the last day of July 1831, the whole time occupied in its erection having been seven years, five months, and seventeen days.

The bridge, as has been already stated, consists of five elliptical arches, the least of which is larger than any stone arch of this description ever before erected. The centre arch is 152 feet span, with a rise of twenty-nine feet six inches above high-water mark. The two arches next the centre are 140 feet span, with twenty-seven feet six inches of rise; and the two abutment arches are 130 feet span, rising twenty-four feet six inches. The piers are of a rectangular form, and perfectly solid. The great diminution in the quantity of masonry by the semielliptical form of the arch has admitted of the piers being reduced in thickness below the ordinary proportions. The bases of the piers are of a circular cone-topped form; they harmonize with the waving line of the water, and prevent the impression of tameness which might have resulted from the plainness and rectangular shape of the shafts. A simple modillion cornice, supported on dentils formed of solid beams of granite, runs along the upper part of the bridge, and marks externally the line of roadway. This is surmounted by a close parapet, in perfect keeping with

¹ The foregoing article was written by the late Dr Thomas Young, for the *Supplement* to the Fourth, Fifth, and Sixth Editions of this Encyclopædia.

the simplicity of the whole structure. The line of roadway, or upper surface of the bridge, is a segment of a very large circle, the rise being only one in 132. The abutments are each seventy-three feet wide at the base, and they spread out backward, so as to sustain the thrust of the bridge with the best effect.

The length of the bridge from the extremities of the abutments is 982 feet, and within the abutments 728 feet; the roadway is fifty-three feet between the parapets, being eight feet wider than the old bridge, and eleven feet wider than any other bridge on the Thames. Of this width, the footways occupy nine feet each, and the carriageway thirty-five feet. The whole bridge, including the dry arches over Thames and Tooley Streets, is constructed of the finest granite, selected from the quarries of Aberdeen, Heytor, and Penryn. The remaining arches over which the approaches pass are of brick. The total quantity of stone employed was about 120,000 tons. Magnificent candelabra of brass support the gas lamps, and the ends of the parapet are finished with four immense blocks of granite. The building expense of the bridge amounts at present to £506,000; the remainder of the whole expense has been incurred by the approaches. A side view of the bridge is exhibited in Plate CXXXIII. fig. 7, and a plan of the roadway in fig. 8.

A few years ago the elliptical arches of Blackfriars and Waterloo Bridges were considered as the largest ever erected; but the centre arch of the one is less by one half, and that of the other by one fourth, than the centre arch of the new London Bridge. Plate CXXXIII. fig. 2, will give a distinct notion of their relative magnitudes, in which AA represents the curve of the Blackfriars arch, BB that of the Waterloo, and CC that of the new London Bridge, stretching out far above and beyond the others.

Dunkeld Bridge, which crosses the Tay, was completed in the year 1809, after a design of Mr Telford; and, by competent judges, is regarded as one of his happiest efforts. It consists of five large and two small arches. The figure of the arch is a segment of a circle. This is the form which Mr Telford seems to have adopted for all his bridges. Some may be of opinion that it is less elegant than the semi-ellipse; but looking at Dunkeld Bridge, we hesitate to pronounce an absolute opinion.

The principal dimensions of the bridge are these:—

	Feet.	In.
Span of the middle arch.....	90	0
Span of the two adjoining arches.....	84	0
Span of the two side arches.....	74	0
Span of the land arches.....	20	0
Rise of the middle arch.....	30	0
Breadth across the soffit.....	27	0
Breadth of roadway within the parapets.....	25	0
Breadth of footpath on each side.....	3	6
Thickness of each of the two middle piers.....	16	0
Thickness of each of the two adjoining piers.....	14	0
Thickness of each of the two side piers.....	20	0
Thickness of the land abutment.....	7	0

The Dean Bridge, Edinburgh, is remarkable on account of its situation, its magnitude, the style of its elevation, the peculiarities of the details of its construction, and the practical advantages of those peculiarities as proved by the complete success which has attended the execution of the design.

This edifice is situated at the north-west extremity of the city of Edinburgh, and crosses the deep ravine formed by the stream called the Water of Leith, a little above St Bernard's Well. This ravine had previously been found an effectual barrier to the extension of the New Town in the north-western direction, and presented an obstacle to the

improvement of the high northern or Queensferry Road, which could only be surmounted by a spacious bridge.

The length of the Dean Bridge is 447 feet, and the width between the parapets thirty-nine feet, consisting of a carriageway twenty-three feet wide between the curb-stones, and two footpaths, each eight feet wide. The height of the roadway above the bed of the river is 106 feet.

The style of the elevation is unprecedented, and demands our particular attention.

A lofty bridge forming a commodious roadway across a deep ravine, will, from the nature of its romantic situation, and its evident utility, excite our admiration, notwithstanding that, when examined as a work of art, solely upon its own merits, and when our minds are divested of the fulness of gratification derived from the surrounding scenery, we frequently find its architectural details and outline devoid of taste, and deservedly the object of our disapprobation.

Upon examining, strictly upon their own merits as architectural productions, even the grandest viaducts and aqueducts hitherto constructed of masonry only, it will, we venture to say, be generally felt, either that the pillars have a heavy and clumsy appearance, or that the great mass of masonry being uppermost, the superstructure appears too massive, on account of the unusual altitude at which it is supported; and we are of opinion that the expansive mass of dead flat masonry presented by the spandrels over the pillars, and between the adjacent arches, is the principal cause of the anomaly, especially when semi-circular arches, on many accounts to be preferred in such situations, are adopted.

This observation is in some measure applicable to all descriptions of stone bridges. To large bridges over rivers, of which the springers, and consequently the mass of the spandrels, do not require to be elevated far above the surface of the water, the objection has less weight; but even in this case the difficulty has been generally felt, as is proved by the incessant endeavours of engineers to form new designs for carrying up the masonry over the piers, so as to give relief to the face of the spandrel walls. The ordinary devices for this purpose, if applied to a lofty bridge or viaduct, would be attended with many practical objections, and would fail of producing the desired effect.

It therefore remained a desideratum to devise a method by which the masonry composing the body of a bridge, to be supported upon lofty pillars, may have its exterior elevation or outline relieved, so as to break the flatness of the spandrel walls, thereby giving lightness and elegance to the superstructure; and it was essential to the perfect fulfilment of this object to produce the desired effect by some bold stroke of extension upon the general plan, not by the aid of minor superficial ornaments, now generally discarded, particularly from bridges whose magnitude alone insures grandeur, and purity of design the most effective beauty.

With the aid of Plate CXXXV. the following description will convey an accurate idea of the design of the Dean Bridge, which may be regarded as consisting of these parts, viz. the main body of the bridge supporting the carriageway, and the wing-arches on each side supporting the footpaths.

The main body of the bridge consists of four arches, segments of circles, each ninety feet span and thirty feet rise; consequently the radius of curvature of the arch is forty-eight feet nine inches. The width across the soffit is thirty-one feet. These main arches are supported upon hollow pillars, hereafter more particularly described, eleven feet thick and thirty-one feet wide, agreeably to the soffit of the arch. The arch springers are set at the

Dunkeld
Bridge.

The Dean
Bridge,
Edinburgh.

Bridge.

height of sixty-seven feet above the level of the bed of the stream flowing underneath the second arch from the south. The depth of the arch-stones of these main arches is three feet, being one thirtieth of the span. Over the pillars, and between the adjacent arches, the spandrels are built up solid to the height of twelve feet above the arch springers. The remainder of the spandrels is left hollow, with the exception of the longitudinal spandrel walls, four feet apart, and one foot six inches thick, which being corbelled at the top, and covered with flag pavement stones, support the bridge roadway. The exterior spandrel walls are two feet six inches thick, faced with close-jointed ashlar.

The wing-arches supporting the footpaths constitute the peculiar characteristic of the Dean Bridge, springing from pilasters brought up from the foundation, and executed at the same time with the main pillars, five feet wide in front, and projecting six feet from the body of the pillars. These pilasters are continued up the face of the spandrels of the main arches to the height of seventeen feet four inches above the level of the lower arch springers, at which height the springers for the upper arches are laid. The upper or wing-arches extend over the main arches. There are therefore four on each side of the bridge, each ninety-six feet span, and sixteen feet eight inches rise; consequently the radius of curvature is seventy-seven feet five inches; the width across the soffit is eight feet two inches, of which five feet project in front of the face of the spandrels of the lower arches, the remainder, three feet two inches, being bonded into the main body of the bridge. The depth of the arch-stones is two feet six inches, or about one thirty-eighth part of the span. The face of the outer spandrels of the upper arches is one foot within the face of the main pilasters, allowing an intake of six inches upon the face of the upper arch springers, and the remaining six inches for the projection of a pilaster up the spandrels, in order to relieve, as far as practicable, the flatness of this part of the work.

The upper arches, by a bold projection of five feet, effectually break up and relieve the extensive surface of dead masonry that would otherwise be presented by the spandrels of the ninety feet arches, which being elevated upon lofty pillars, would, when viewed from the walks by St Bernard's Well, along the banks of the rivulet, present a mass of flatness and uniformity detractive from the general gratification which the height and magnitude of the edifice, and the beauty of the surrounding scenery, would nevertheless insensibly create.

The upper arches of the Dean Bridge forming in a measure a secondary member of the edifice, their spandrels may with propriety be further relieved with ornamental sculpture, which, though generally excluded from modern bridges, would in this case be rendered appropriate by the circumstance of the close vicinity of the bridge to the most splendid buildings of the New Town of Edinburgh. However, the general purity of the design renders it doubtful whether or not such embellishment would be conducive to the perfection of the work, and may be regarded as doubtful.

The cornice consists of a frieze course and cordon, together two feet six inches in height. The parapet consists of a base, dado, and coping, together four feet in height above the footpath pavement. The profile of the cornice and parapet will be best understood by reference to Plate CXXXV. It will be observed that the members are very few, bold, and easily executed; the effect thus produced upon the elevation is particularly striking; and smaller members at such an elevation would fail of producing any effect.

We shall now consider the peculiarities and practical advantages of the details of the construction of the Dean Bridge.

The pillars which support the main arches or body of the bridge are eleven feet thick, but not of solid masonry, there being four voids in the shaft of each pillar, of which the dimensions and construction will be clearly understood from Plate CXXXV. fig. 1 and 2. The side walls are three feet thick, and the interior cross walls which connect them two feet, all of squared ashlar, laid in uniform courses throughout; the interior stones being of the same height as the face stones, and as fully and truly squared upon the bed. In these three-foot walls every alternate course consists entirely of headers, three feet on the bed, and the intermediate courses are of stretchers laid in pairs, each about one foot five and a half inches on the bed, the space of about one inch being left for the longitudinal joint, to allow room for forcing down stiff mortar with a wooden sword, it being found that this method of grouting the vertical joint with stiff mortar makes more solid work than would be effected by laying the stones nearly close, and pouring in thin grout, which gradually dries up and leaves the joint void.

Many practical advantages attend the construction of hollow pillars. That part only of the masonry is omitted which, if the pillar were solid, would tend in the least degree to its effective stability, and, consequently, being almost a useless mass, would do more harm than good, by operating as a pernicious load upon the foundations. Also, by this method, the bed of every stone throughout the work is exposed to view, which insures perfect workmanship in the setting, on which the strength of masonry mainly depends. Moreover, the great proportion of materials, labour, and workmanship thus saved is an important consideration.

In the dressing of ashlar required to carry a heavy load, as that for the pillars of a bridge, especial pains must be taken that the stones be as full at the back as at the front; for it is here of importance to observe that workmen, especially piece-workmen, find it much to their advantage to infringe upon this fundamental rule in good masonry. By working the stone lean on the back, they can slap away more freely and do more work than if truth to the square be insisted on; and, moreover, when the stone comes to be laid, the inequality of pressure will produce a fine joint without any trouble on the part of the setter. To this vicious practice of working ashlar lean on the bed, the skirping of the face-work and bulging of the walls may generally be attributed; and it is principally owing to its having been specified that drafts be put along the backs of the beds of the ashlar, and the stone kept full, that the great pressure on the three-foot walls of the pillars of the Dean Bridge has produced no skirps or cracks in any part of the work.

It remains to be explained by what method the upper arches were executed, so as to allow of their subsiding freely upon the centres being struck, without receiving any obstruction from the lower spandrels; for it is evident, that had the centres of the main arches been struck and the spandrels completed close up to the soffit of the upper arches, the upper arches would, upon their centres being subsequently struck, have been subject to unequal depression; the interior three feet two inches of the soffit being hard upon the lower spandrel walls, and the projecting five feet left to subside freely by its own weight, which unequal bearing would infallibly have disturbed the whole superstructure. And it is equally evident that the lower and upper arches, being dissimilar, would not subside equally, and therefore could not be struck at the same time dependent on each other. The course, therefore,

Bridge. pursued in the case of the Dean Bridge, was to strike the centres of the lower arches as soon as the arch-stones were laid, and immediately to proceed with the turning of the upper arches and the striking of their centres, previous to the completion of the lower spandrels. This was a most delicate operation, and we believe it to have been unprecedented; for the pilasters or pillars of the upper arches being only five feet wide, it follows that the four upper arches of ninety-six feet span each were supported solely upon their pillars of five feet thick, being only one nineteenth of the span of the arch. To accomplish this, it was evidently necessary that all the four arches should be struck as gradually and as equally as possible, and which was done with great care, never allowing the slack blocks to be driven farther at one time than sufficient to let down the centre a quarter of an inch. It was found that these upper arches subsided very nearly equally and gradually during the course of a month, by which time they attained permanent stability, and the total depression amounted to about four and a half inches each at the crown. The lower arches subsided about three inches each at the crown. In constructing the centres a subsidence of three inches was calculated upon for the lower arches, and six inches for the upper arches, and so much additional rise given to the centres accordingly, over and above what was intended for the arches when complete.

After having allowed the upper arches freely to attain their position of permanent stability, a considerable portion of their spandrel walling was built, and the centring removed, and the masonry of the lower spandrels made good up to their soffits. In completing the exterior spandrels of the upper arches, which are only eighteen inches

thick, they were connected with the interior spandrels by means of dovetailed bond-stones, which, at the same time that they gave stability and stiffness to the walls, effectually tied them to the interior work, rendering the wings and the main body of the bridge a perfectly connected mass.

In all extensive edifices composed of heavy materials, it is of primary consequence to the stability of the work that good arrangements be made whereby every stone may be laid with ease and expedition, by means of cranes or other mechanical contrivances. This point cannot be too forcibly insisted upon; for whatever pains may be taken in preparing the materials, it will frequently be found, upon setting the stones, that the bed of lime is either too full or too lean, or that the stone is in some respects unsuitable, and ought to be raised. If, therefore, it can be raised with ease and expedition, it is done at once, and the fault rectified; but if the arrangements for setting be imperfect, the uniformity of the bed of lime is disturbed before the stone is properly seated in its place, and glaring imperfections will be submitted to rather than incur the labour and loss of time consequent to its reparation. The success which has attended the execution of the Dean Bridge, and the expedition with which the work was carried on, are in a great measure attributable to the judicious manner in which the cranes, machinery, and scaffolding were constructed.

The Dean Bridge was commenced in October 1829, and completed, with the exception of the parapet, in December 1831. It is gratifying to all concerned, that not a single accident occasioning loss of life or limb occurred during the progress of the work.

See CHAIN BRIDGES.

Bridge-Town.

EXPLANATION OF THE PLATES.

Plate CXXXII. fig. 1. If AB represent the distance of any two particles of matter, and BC, DE, FG, the repulsive forces at the distances AB, AD, AF, respectively, and BC, DH, FI, the corresponding cohesive forces, then GI must be ultimately to EH as FB to BD. (Sect. I. Prop. A.)

Fig. 2. The block will support twice as great a pressure applied at A as at B. (Prop. B.)

Fig. 3. It is obvious that $ABC - ADE = ABC - CFG$, HI being = HK, and HG = HA; and the difference ABFHA is always equal to $DB \times KH$. (Prop. C.)

Fig. 4. It is evident that AB is to CD as AE to CE, or as $z + \frac{1}{2}a$ to z . (Prop. E.) It is also obvious that as z or CE is to CD, so is EF to FG. (Prop. F.)

Fig. 5. Supposing the arch AB to be so loaded in the neighbourhood of C as to require the curve of equilibrium to assume the form ADCEB, the joints in the neighbourhood of D will be incapable of resisting the pressure in the direction of the curve CD, and must tend to turn on their internal terminations as centres, and to open externally. (Prop. Y.)

Fig. 6. A, B, C, different steps in the fall of a weak arch. (Prop. Y.)

Fig. 7. Elevation and plan of Messrs Telford and Douglas's proposed iron bridge over the Thames. (Sect. V.)

Fig. 8. Elevation of Mr Darby's iron bridge at Colebrook Dale. (Sect. VI.)

Fig. 9. Elevation of Mr Burdon's bridge at Wearmouth. (Sect. VI.)

Fig. 10. Elevation of Mr Telford's bridge at Buildwas. (Sect. VI.)

Fig. 11. Elevation of Messrs Jessop's bridges at Bristol. (Sect. VI.)

Fig. 12. Elevation of Mr Telford's bridge at Dunkeld. Plate CXXXIII. fig. 1. Elevation of the bridge of the Louvre at Paris. (Sect. VI.)

Fig. 2. Comparative size of the arches of Blackfriars, Waterloo, and the new London Bridge.

Fig. 3. Elevation of Vauxhall Bridge. (Sect. VI.)

Fig. 4. Elevation of Southwark Bridge. (Sect. VI.)

Fig. 5. Plan of Southwark Bridge. (Sect. VI.)

Fig. 6. Elevation of the old London Bridge.

Fig. 7. Elevation of the new London Bridge.

Fig. 8. Plan of the new London Bridge.

Plate CXXXIV. fig. 1. Elevation of Waterloo Bridge. (Sect. VI.)

Fig. 2. Plan of Waterloo Bridge. (Sect. VI.)

Fig. 3. Section of an arch of Waterloo Bridge, showing the foundations of the piers and the spandrel walls of brick, together with the centre supporting it. The dotted line represents the direction of the curve of equilibrium. (Sect. VI.)

Plate CXXXV. Elevation and plan of the Dean Bridge, Edinburgh, and the section of an arch.

BRIDGE, in *Gunnery*, the two pieces of timber which go between the two transoms of a gun-carriage.

BRIDGE, in *Music*, a term for that part of a stringed instrument over which the strings are stretched. The bridge

of a violin is about one inch and a quarter in height, and near an inch and a half in length.

BRIDGE-TOWN, the capital of the island of Barbadoes. See BARBADOES.

Bridgend
||
Bridport.

BRIDGEND, a market-town of the county of Glamorgan, in South Wales, being partly in the parish of Newcastle and partly in that of Coity, 179 miles from London. It stands on the river Ogmore, which supplies a great abundance of salmon and other fish, and the market, held on Saturday, is well supplied with all other necessities. There is a neat county-hall, where the sessions, and occasionally the county elections, are held.

BRIDGENORTH, a borough and market-town of the hundred of Stoddendon, in the county of Salop, 140 miles from London, on the river Severn. It is an ancient place, in the vicinity of which are many interesting remains of antiquity. There is a considerable trade carried on in iron, leather, pipes, malt, and building boats for navigating the Severn. The town returns two members to parliament, who are chosen by the corporation and the freemen, in number about seven hundred, over whom the family of Whitmore have long held a predominant influence. The inhabitants amounted in 1801 to 4408, in 1811 to 4179, and in 1821 to 4345.

BRIDGEWATER, a borough and market-town of the hundred of North Petherton, in the county of Somerset, 142 miles from London. It stands on the river Parret, on which vessels from sea ascend to the iron bridge, but are aground at low water. There is much trade here, as coals for the supply of the interior are imported in large quantities, and much malt and a peculiar kind of bricks are exported. There is a good market on Thursday. Two members are returned to parliament by the inhabitant householders. The inhabitants amounted in 1801 to 3634, in 1811 to 4179, and in 1821 to 6155.

BRIDLE, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the fore-head and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins or thongs of leather, which, proceeding from the rings of the bit, and cast over the horse's head, are held by the rider in his hand; the nose-band, passing through loops at the back of the head-stall, and buckled under the cheeks; the trench; the cavesan; the martingal; and the chaff-halter.

Pliny assures us that one Pelethronius first invented the bridle and saddle, though Virgil ascribes the invention to the Lapithæ, to whom he applies the epithet *Pelethronii*, from a mountain in Thessaly named *Pelethronium*, where horses were first begun to be broken.

The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the manège; and hence it is that on Trajan's column soldiers are represented riding at full speed without any bridles on.

BRIDPORT, a borough and market-town in the hundred of Beaminster and county of Dorset, 134 miles from London, on the river Brit, which is divided into two branches, one of them passing at the east, the other at the west end of the town. The manufacturing industry here is very great, producing sail-cloth, twine, nets, ropes, and other requisites for the Newfoundland fishery. The harbour is small and almost choked, but some vessels are built celebrated for their fast sailing. The streets are wide and well paved, and where the four cross streets meet is a handsome town-hall. It returns two members to parliament, chosen by the inhabitant householders. There is a

good market on Saturday. The population amounted in 1801 to 3117, in 1811 to 3666, and in 1821 to 3742.

BRIEF, in *Law*, an abridgment of the client's case, made out for the instruction of counsel on a trial at law; wherein the case of the litigant is to be briefly but fully stated.

BRIEF, or *Brieve*, in *Scots Law*, a writ issued from the Chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the facts mentioned in the brief, and upon their verdict to pronounce sentence.

Apostolical BRIEFS, letters which the pope dispatches to princes or other magistrates, relating to any public affair. These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of a fisherman, or St Peter in a boat.

BRIEG, a circle in the Prussian province of Silesia, extending over 213 square miles, or 136,320 acres, containing two cities, two market-towns, sixty-two villages, and 5226 houses, inhabited by 34,342 individuals. It is divided into two parts by the river Oder, is a level district, and, on the Polish side of that river, is covered with woods. The only manufacture is that of linens. The capital of the circle, the city of Brieg, is on the banks of the Oder, a well-built town, containing four Lutheran and three Catholic churches, with several public charitable institutions. The inhabitants amount to 10,547, who are occupied in various manufactures, and carry on trade by the Oder with the Baltic Sea at Stettin.

BRIEL, a town in the province of South Holland, in the Netherlands, the chief place of a circle of the same name, on the north side of the island Boorne, near the mouth of the Maas. It contains about 3800 men, of whom many are fishermen and pilots. It is interesting as the place the capture of which laid the foundation of the power and wealth of the United Provinces. Long. 4. 3. 45. E. Lat. 51. 54. 15. N.

BRIEY, an arrondissement of the department of Moselle, in France, extending over 474 square miles, comprehending five cantons and 165 communes, with 56,112 inhabitants. The chief place, a town of the same name, on the river Waget, contains about 1900 inhabitants.

BRIG, or **BRIGANTINE**, a merchant-ship with two masts. This term is not universally confined to vessels of a particular construction, or which are masted and rigged in a manner different from others, but is variously applied, by the mariners of different European nations, to a peculiar sort of vessel in their own marine. Amongst British seamen this description of vessel is distinguished by having her main-sails set nearly in the plane of her keel, whereas the main-sails of larger ships are hung athwart, or at right angles with the ship's length, and fastened to a yard which hangs parallel to the deck. In a brig, the foremost edge of the mainsail is fastened in different places to hoops which encircle the main-mast, and slide up and down it as the sail is hoisted or lowered; and it is extended by a gaff above and a boom below.

BRIGADE, in the military art, signifies the union of several squadrons or battalions under the command of a colonel, who has also the rank of brigadier-general in the army. A *brigade of artillery* consists of a certain number of cannon or field-pieces, with the necessary munitions, stores, and gunners. The soldiers attached to these guns are also collectively denominated a brigade, and are under the command of a superior officer of artillery. A *brigade of cavalry* consists of different regiments, making together eight or ten squadrons, and commanded by a colonel of

Brief
||
Brigade.

Br. de cavalry, who has the rank of brigadier-general in the army. A *brigade of dragoons* consists of different regiments of dragoons, making together eight squadrons or more, and commanded by a colonel of dragoons, who has also the rank of brigadier-general in the army. A *brigade of infantry* consists of two or more regiments of foot, making together four, five, six, eight, or more battalions, commanded by a colonel of foot, who has the rank of brigadier-general in the army. And, generally, according to the most modern arrangement of troops, two or more regiments constitute a brigade, two or more brigades a division, two or more divisions a corps d'armée, and two or more corps d'armée a grand army.

BRIGADE-Major is an officer appointed by the brigadier to assist him in the management and ordering of his brigade.

BRIGADIER, a military officer, whose rank is next above that of colonel, and who is intrusted with the command of a brigade. In Great Britain this rank is in abeyance during peace, but revived in actual service in the field. Every brigadier marches at the head of his brigade upon duty. The *brigadier des armées* of the French service corresponds to our brigadier-general, and, like him, has the command of a brigade of cavalry, dragoons, or infantry.

BRIGANDINE, a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRIGG, or **GLANDFORD BRIGG**, a market-town in the hundred of Yarborough and county of Lincoln, 153 miles from London, on the river Ancolme, which is navigable to the Humber. There is a large corn-market here on Thursday. The inhabitants amounted in 1801 to 1327, in 1811 to 1497, and in 1821 to 1674.

BRIGGS, **HENRY**, one of the greatest mathematicians of the sixteenth century, was born at Warley Wood, in the parish of Halifax, Yorkshire, in the year 1556. In 1592 he was appointed examiner and lecturer in mathematics, and soon afterwards reader of the physical lecture founded by Dr Linacer. When Gresham College in London was established, he was chosen the first professor of geometry there, about the beginning of March 1596. In 1609 Mr Briggs contracted an intimacy with Usher, afterwards archbishop of Armagh, which continued many years, and was kept up chiefly by letters, two of which, written by the subject of this notice, are still extant. In one of these letters, dated in August 1610, he tells his friend he was engaged on the subject of eclipses; and in the other, dated in March 1615, he acquaints him with his being wholly employed about the noble invention of logarithms, then lately discovered, and in the improvement of which he had afterwards a large share. In his lectures at Gresham College, he proposed the alteration of the scale of logarithms, from the hyperbolic form which Napier had given them, to that in which unity is assumed as the logarithm of the ratio of ten to one; and soon afterwards he wrote to the inventor to make the same proposal to himself. In 1616 Briggs paid a visit to Napier at Edinburgh, in order to confer with that eminent person respecting the suggested change; and next year he repeated his visit for a similar purpose. During these conferences the alteration proposed by Briggs was agreed upon; and on the return of the latter from his second visit in 1617, he accordingly published the first chiliad of his logarithms. In 1619 he was appointed Savilian professor of geometry at Oxford, and resigned his professorship of Gresham College on the 25th of July 1620. Soon after his settlement at Oxford he was incorporated master of arts in that university, where he continued a laborious and studious life, employed partly in discharging the duties of his office, and partly in the computation of logarithms and in other

useful works. In 1622 he published a small tract on the "North-west Passage to the South Seas, through the continent of Virginia and Hudson's Bay;" and in 1624 he printed, at London, his *Arithmetica Logarithmica*, in folio, a work containing the logarithms of thirty thousand natural numbers to fourteen places of figures besides the index. He also lived to complete a table of logarithmic sines and tangents for the hundredth part of every degree to fourteen places of figures besides the index, with a table of natural signs to fifteen places, and the tangents and secants for the same to ten places; all of which were printed at Gouda in 1631, and published in 1633 under the title of *Trigonometria Britannica*. In the construction of these works, the author, besides immense labour and application, displayed great powers of genius and invention; and in his investigations may be detected the germs of discoveries in mathematics which are generally considered as of later invention, namely, the binomial theorem, the differential method and construction of tables by differences, the interpolation by differences, together with angular sections, and several other things of scarcely inferior importance. Mr Briggs terminated his laborious and useful life on the 26th of January 1630, in the seventy-fourth year of his age. Dr Smith gives him the character of being a man of great probity, a contemner of riches, and contented with his own station, preferring a studious retirement to all the splendid circumstances of life. His works are, 1. A Table to find the Height of the Pole, the Magnetical Declination being given, London, 1602, 4to; 2. Tables for the Improvement of Navigation, printed in the second edition of Edward Wright's treatise entitled "Certain Errors in Navigation detected and corrected," London, 1610, 4to; 3. A Description of an Instrumental Table to find the part proportional, devised by Mr Edward Wright, London, 1616 and 1618, 12mo; 4. *Logarithmorum Chilias prima*, London, 1617, 8vo; 5. *Lucubrationes et Annotationes in opera posthuma J. Neperi*, Edinburgh, 1619, 4to; 6. *Euclidis Elementorum VI. libri priores*, London, 1620, folio; 7. A Treatise on the North-west Passage to the South Sea, London, 1622, 4to, reprinted in Purchas's Pilgrims, vol. iii. p. 852; 8. *Arithmetica Logarithmica*, London, 1624, folio; 9. *Trigonometria Britannica*, Goudæ, 1663, folio; 10. Two Letters to Archbishop Usher; 11. *Mathematica ab Antiquis minus cognita*; and some other works, as his Commentaries on the Geometry of Peter Ramus, and Remarks on the Treatise of Longomontanus respecting the quadrature of the Circle, which have not been published.

BRIGGS, **William**, an eminent physician in the latter end of the seventeenth century, was the son of Augustin Briggs, Esq. four times member for the city of Norwich, where our author was born. He studied at the university of Cambridge; and his genius leading him to cultivate physic, he travelled into France, where he attended the lectures of the celebrated anatomist M. Vieussens at Montpellier. After his return he published his *Ophthalmographia* in 1676. The year following he was created doctor of medicine at Cambridge, and soon after was made fellow of the College of Physicians at London. In 1682 he resigned his fellowship in favour of his brother; and the same year his *Theory of Vision* was published by Hooke. The ensuing year he sent to the Royal Society a continuation of that discourse, which was published in their Transactions; and the same year he was appointed by King Charles II. physician to St Thomas's Hospital. In 1684 he communicated to the Royal Society two remarkable cases relating to vision, which were likewise printed in their Transactions; and in 1685 he published a Latin version of his *Theory of Vision*, at the desire of Mr, afterwards Sir Isaac Newton, professor of mathematics at Cam-

Briggs.

Bright-helmstone bridge, with a recommendatory epistle from him prefixed to it. He was afterwards appointed physician in ordinary to King William, and continued in great esteem for professional skill till his death, which took place in September 1704.

Brignoles.

BRIGHTELMSTONE, or **BRIGHTON**, a town on the sea-coast, in the hundred of Whalesbone and rape of Lewes, in the county of Sussex. The growth of this place is one of those manifestations of the progress of wealth and the increased power of gratification in this kingdom, which on reflection cannot fail to excite astonishment. This town, a small fishing place till 1784, with neither commerce nor manufactures, and with no peculiar advantages even for sea-bathing, which formed the only pretext for visiting it, has, by the mere force of fashion acting upon rapidly-augmented wealth, grown up to be a city almost of palaces, exhibiting a display of every comfort and even luxury, and containing a population of more than 40,000 persons. It is built under the shelter of the South-down Hills, which protect it from the northern and eastern blasts, and hence it is as much a place of resort for the idle, the invalid, and the mere fashionist, in the winter, as it was at its first establishment in the summer season. Magnificent squares and parades have been built, which have speedily found occupants; the embellishments have kept pace with their growth; churches and chapels have been erected to supply religious aid to all sects and all tastes; hotels, club-houses, and other establishments, have been formed for purposes of amusement; carriages and horses are in readiness equal to the demand for them; and every necessary, every accommodation, and almost every luxury, may be found in the markets, the shops, and the repositories. By means of steam-boats it has become one of the passages to France, and from thence the inhabitants can obtain supplies of fruit, vegetables, game, poultry, and other articles at reasonable rates. In addition to other inducements, a German institution for producing all the waters of the most celebrated medicinal springs on the Continent has, at much expense, and with very great scientific skill, been constructed. A new town has been built or is building, called Kemp Town, to contain houses of a large kind, sufficient for ten thousand more inhabitants. According to the government census, the population amounted in 1801 to 7339, in 1811 to 12,012, and in 1821 to 24,429; but the greatest proportional increase has been since the last of these years.

BRIGITTINS, or **BRIDGETINS**, more properly *Brigittins*, a religious order, so called from their founder, St Bridget, or Birgit, a Swedish lady of the fourteenth century, whom some represent as a queen, but Fabricius, on better grounds, considers as a princess, the daughter of King Birgenes, legislator of Upland, and famous for her revelations. The Brigittins are sometimes also called the Order of our Saviour, from their pretending that Christ himself dictated to St Bridget the rules and constitutions observed by them. In the main, the rule is the same as that of St Augustin; only with certain additions supposed to have been revealed by Christ, and hence called the Rule of our Saviour. This order spread considerably through Sweden, Germany, the Netherlands, and other parts. In England we read but of one monastery of Brigittins, which was built in 1415 by Henry V., opposite to Richmond, and is now called Sion House. The revenues were reckoned at L.1495 per annum.

BRIGNOLES, an arrondissement of the department of the Var, in France. Its extent is 492 square miles, and it contains eight cantons, twenty-six communes, and 66,184 inhabitants. The chief place, of the same name, is situated on the river Salme, in a mountainous district, containing 5301 souls. Long. 6. 50. E. Lat. 43. 24. N.

BRILLIANT, in a general sense, something that has a bright and lucid appearance.

BRILLIANTS, a name given to diamonds of the finest cut. See **DIAMOND**.

BRILON, a circle in the Prussian government of Arnberg, and province of Westphalia. It extends over 376 square miles, or 240,640 acres, contains six cities, four market-towns, eight parishes, and 105 hamlets, with 3652 houses, and 29,082 inhabitants. Although the northern part is hilly and woody, the valleys to the south are fertile, and yield sufficient corn and cattle for the dense population. The chief object of industry is the linen trade. The capital, which gives its name to the circle, is near the river Ruhr. It was formerly one of the Hans Towns. It contains two churches, 396 dwelling-houses, and 2766 inhabitants, chiefly employed in the various branches of the linen trade. Long. 8. 4. 10. E. Lat. 51. 22. 20. N.

BRIM denotes the utmost verge or edge, especially of round things. The brims of vessels are made to project a little over, to prevent liquors, when poured out, from running down the side of the vessel. The brimming of vessels was contrived by the ancient potters, in imitation of the supercilium or dip of the cornices of columns.

BRINDISI, a city on the shores of the Adriatic, in the province of Otranto and kingdom of Naples. It was formerly fortified, but its defences are now dilapidated. It contains a cathedral, several cloisters and nunneries, and at present only 6150 inhabitants. The harbour is now nearly choked up with sand, and hence its importance has declined gradually from the state which it had attained under the name of Brundisium, when the population amounted to 60,000, and it enjoyed an extensive trade. Long. 17. 55. E. Lat. 40. 52. N.

BRINDLEY, JAMES, a man celebrated for mechanical inventions, and particularly skilful in planning and conducting inland navigation, was born in 1716, at Tunsted in Derbyshire. Through the mismanagement of his father, his education was totally neglected; and, at seventeen, he bound himself apprentice to a mill-wright, near Macclesfield, in Cheshire. He served his apprenticeship, and afterwards setting up for himself, by inventions and contrivances of his own advanced the mill-wright business to a degree of perfection which it had not attained before. The consequence was, that his fame as an ingenious mechanic spreading widely, his genius was no longer confined to the business of his profession. In 1752 he erected a very extraordinary water-engine at Clifton, in Lancashire, for the purpose of draining coal mines; and, in 1755, he was employed to execute the larger wheels for a new silk mill at Congleton, in Cheshire. The potteries of Staffordshire were also about this time indebted to him for several valuable additions to the mills used by them for grinding flint-stones. In 1756 he undertook to erect a steam-engine near Newcastle-under-Line, upon a new plan; and it is believed that he would have brought this engine to a great degree of perfection, if some interested engineers had not opposed him.

His attention, however, was soon afterwards called off to another object, which in its consequences has proved of high importance to trade and commerce; namely, the projecting and executing of inland navigations. By these navigations the expense of carriage is lessened; a communication is opened from one part of the kingdom to another, and from each of these parts to the sea; and hence products and manufactures are afforded at a moderate price. The Duke of Bridgewater having at Worsley, about seven miles from Manchester, a large estate abounding with coal, which had hitherto lain useless because of the expense of land-carriage, and being desirous to work these mines, perceived the necessity of construct-

Brindley. ing a canal from Worsley to Manchester; upon which occasion Brindley was consulted, and having declared the scheme practicable, an act for this purpose was obtained in 1758 and 1759. But as it was afterwards discovered that the navigation would be more beneficial if carried over the river Irwell to Manchester, another act was obtained to vary the course of the canal agreeably to the new plan, and likewise to extend a side-branch to Longford Bridge in Stretford. Brindley, in the mean time, had begun these great works, being the first of the kind ever attempted in England with navigable subterraneous tunnels and elevated aqueducts; and, in order to preserve the level of the water, and free it from the usual obstructions of locks, he carried the canal over rivers and many large and deep valleys. When it was completed as far as Barton, where the Irwell is navigable for large vessels, he proposed to carry it over that river by an aqueduct of thirty-nine feet above the surface of the water; and though this project was treated as wild and chimerical, yet, supported by his noble patron, he began his work in September 1760, and the first boat sailed over it in July 1761. The duke afterwards extended his ideas to Liverpool, and obtained, in 1762, an act for branching his canal to the tide-way in the Mersey; this ramification of the work being carried over the rivers Mersey and Bolland, and over many wide and deep valleys.

The success of the Duke of Bridgewater's undertakings encouraged a number of gentlemen and manufacturers in Staffordshire to revive the idea of a canal navigation through that county, and Brindley was therefore engaged to make a survey from the Trent to the Mersey. This canal was begun in 1766, conducted under Brindley's direction as long as he lived, and finished after his death by his brother-in-law Mr Flemshall in May 1777. The proprietors called it the Canal from the Trent to the Mersey; but the engineer, more emphatically, the Grand Trunk Navigation, on account of the numerous branches, which, as he justly supposed, would be every way extended from it. It is ninety-three miles in length, and, besides a large number of bridges over it, has seventy-six locks and five tunnels. The most remarkable of the tunnels is the subterraneous passage of Harecastle, being 2880 yards in length, and more than seventy yards below the surface of the earth. The scheme of this inland navigation had employed the thoughts of the ingenious part of the kingdom for upwards of twenty years before, and some surveys had been made; but Harecastle Hill, through which the tunnel is constructed, could neither be avoided nor overcome by any expedient which the most able engineers could devise. It was Brindley alone who surmounted this, and other similar difficulties arising from the variety of strata and quicksands, which no one but himself would have attempted to conquer.

Brindley was engaged in many other similar undertakings; for a fuller account of which the reader is referred to the *Biographia Britannica*, and to a curious and valuable pamphlet, published many years since, entitled *The History of Inland Navigations, particularly that of the Duke of Bridgewater*. Brindley died at Turnhurst in Staffordshire on the 27th September 1772, in his fifty-sixth year, being supposed to have shortened his days by too intense application, and to have brought on a hectic fever, which continued in his system for some years before it consumed him. He never indulged or relaxed himself in the common diversions of life, not having the least relish for them; and though once prevailed on to see a play in London, yet he declared that he would on no account be present at another, because it so disturbed his ideas for several days after as to render him unfit for business. When any extraordinary difficulty occurred to him in the exe-

cution of his works, he generally retired to bed, and lay there one, two, or three days, till he had surmounted it. He then got up and executed his design without any drawing or model; for he had a prodigious memory, and carried every thing in his head.

As his station in life was low, and his education totally neglected, so his exterior accomplishments were suitable to them. He could indeed read and write, but very indifferently; and he was perhaps as thoroughly *abnormis sapiens*, "of mother-wit, and wise without the schools," as any man that ever lived. "He is as plain a looking man," says a writer of the time, describing him, "as one of the boors in the Peak, or his own carters; but when he speaks, all ears listen; and every mind is filled with wonder at the things he pronounces to be practicable." The same author adds, "Being great in himself, he harbours no contracted notions, no jealousy of rivals; he conceals not his method of proceeding, nor asks patents to secure the sole use of the machines which he invents and exposes to public view. Sensible that he must one day cease to be, he selects men of genius, teaches them the power of mechanics, and employs them in carrying on the various undertakings in which he is engaged. It is not to the Duke of Bridgewater only that his services are confined; he is of public utility, and employs his talents in rectifying the mistakes of despairing workmen and artizans. His powers shine most in the midst of difficulties; when rivers and mountains seem to thwart his designs, then appears his vast capacity, by which he makes them subservient to his will." Happening on one occasion to be examined before a committee of the House of Commons, and to express a decided preference for artificial navigation as a means of internal communication, a member asked him, "For what purpose, then, do you think rivers were created?" "To furnish water for navigable canals," replied Brindley after a moment's hesitation.

BRINE, or PICKLE, water saturated with saline particles.

BRINE also denotes a pickle pregnant with salt, wherein things are steeped for preservation.

BRINE-Pans, the pits where the salt water is retained, and suffered to stagnate, that by the action of the sun it may be converted into salt. There are divers sorts of salt-pans, as the water-pans, second pan, sun-pan; the water being transferred only from one to another.

BRINE-Pit, in salt making, the salt spring from which the water to be boiled into salt is taken. There are some of these springs in many places. That at Namptwich in Cheshire is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain individuals who, that the market may not be overstocked, permit only a certain quantity of the salt to be made yearly.

BRINE-Springs are fountains which flow with salt water instead of fresh. Of these there are a good number in England; but, though not peculiar to this island, they are far from being common in the countries on the Continent.

To BRING-to, in Navigation, to check the course of a ship when she is advancing, by arranging the sails in such a manner that they shall counteract each other, and prevent her either from retreating or moving forward. In this situation the ship is said to lie by, or to lie to; having, according to the sea phrase, some of her sails *aback*, to oppose the force of those which are full; or having them otherwise shortened by being furled, or hauled up in the brails.

BRINGING-TO is generally used to detain a ship in any particular station, in order to wait the approach of some other that may be advancing towards her; or to retard

Brisson.

BRIOUDE, an arrondissement in the department of the Upper Loire, in France, extending over 706 square miles, and containing eight cantons and 118 communes, with a population of 76,374 persons. The capital is the city of the same name, on the left bank of the river Allier, with 5486 inhabitants. Long. 3. 15. E. Lat. 45. 14. N.

BRISSON, MATHURIN JAMES, a zoologist and natural philosopher, born at Fontenay-le-Comte, 3d April 1723, the son of Mathurin Brisson and Louisa Gabrielle Jourdain. He was originally intended for the church, but he had acquired at an early age a taste for natural history, which was particularly encouraged by the advantage that he enjoyed of passing his holidays with the justly-celebrated Reaumur, who had an estate near Fontenay. At the age of twenty-four he had made great progress in his theological studies, and had fully qualified himself for the rank of a subdeacon; but his courage failed him at the time appointed for taking orders, and he then determined to confine himself to the study of physical sciences. Reaumur had the direction of the chemical laboratory of the Academy of Sciences, and had given up the salary attached to it to several young men in succession, whom he appointed as his assistants, and of whom Pitot and Nollet became afterwards the most distinguished. He now chose Brisson for the situation, which served him, as it had done his predecessors, rather as a step in his advancement with respect to general science, than in enabling him to pursue any objects more immediately chemical; and he followed his passion in attaching himself almost exclusively to natural history. The collection of Reaumur furnished him with ample materials for his studies, and with the principal subjects described in his works on the *Animal Kingdom*. The first of these was published in 1756, containing quadrupeds and cetaceous animals. It consists of simple descriptions of the different species, together with synonyms in various languages, more in the nature of a prodromus than of a complete history. His *Ornithologie* appeared in 1760, forming six volumes, and containing a number of well-executed plates. But upon Reaumur's death, the collection having been added to the royal cabinet, Messrs Buffon and Daubenton, the directors of that cabinet, not affording him all the accommodations that he expected, he discontinued the work, and altogether renounced the study of natural history in favour of natural philosophy.

M. Brisson had been chosen a member of the Academy of Sciences in 1759: he soon afterwards associated himself with the Abbé Nollet in delivering lectures on experimental physics, and obtained the reversion of his appointments of professor in the college of Navarre, and instructor of the royal family in natural philosophy and natural history. The subject of electricity was at this time warmly debated between Nollet and Franklin; and M. Brisson had a difficult task to perform, in discussing the merits of a mistaken friend and an overbearing opponent; but, in fact, this department of science was at that time too little understood to make it disgraceful for Nollet to be in error with respect to the utility of conductors, or for Brisson to remain neutral upon this and other similar questions. He seems, however, by no means to have adhered to the character of neutrality in his anonymous *Translation of Priestley's History of Electricity*, published in 1771, and accompanied by notes, which exhibit a spirit of acrimonious criticism, not at all calculated to enhance the merit of the work which he wished to introduce to the notice of his countrymen. He also attempted, in an *Essay on Waterspouts*, published in the *Memoirs of the academy*, to explain a variety of electrical phenomena,

by means of the different currents of fluid imagined by Nollet, but certainly with very little success.

He afterwards undertook a course of experiments on the *Specific Gravity of Alcohol and Water*, mixed in different proportions, which led him to a conjecture, at that time somewhat singular, that water was not a homogeneous substance. He assisted M. Trudaine and other observers in the experiments which they made on *Heat and Light* with the powerful lens of Bernière; and, in conjunction with M. Cadet, he endeavoured to disprove the opinion of Beccaria, that electricity has a power of reviving the *metallic oxides*. He also made experiments on the *refractive powers* of fluids which might be substituted for flint glass in the object-glasses of telescopes; on the utility of different kinds of *steel for magnetical purposes*; and on the mode of renewal of the *shells of some species of snails*.

In 1772, M. Brisson published a memoir on the *Specific Gravities of Metals*, a subject which, in all its extent, occupied a great portion of his attention during twenty years of his life. The results of his experiments on a great variety of substances were collected into a single volume of *Tables of Specific Gravities*, which was published in 1787. It was principally for the use of students who attended his lectures that he published his *Traité de Physique* and his *Dictionnaire*, both of them containing elementary and popular information, rather calculated exclusively for the immediate purpose which they were intended to serve, than for being of permanent utility in the promotion of the sciences. At a late period of his life he renewed his attention to the subject of chemistry, when the discoveries of his junior contemporaries had given greater certainty and precision to its laws; and his last work was an *Elementary Treatise* on that science, intended for the use of his pupils in the central school.

His whole life was occupied in his studies, and the history of his various works comprehends the history of everything that is to be recorded concerning him. After eighty years of uninterrupted activity of mind, an attack of apoplexy reduced him to a state of second childhood, and effaced from his memory all traces even of his native language, except a few words of the dialect of Poitou, which he had spoken when he was a boy. He died on the 23d of June 1806, and his place in the academy was filled by M. Guy-Lussac. (*Delambre, Mém. Inst. par. vii. Hist. p. 189.*) (L. L.)

BRISSOT, PETER, one of the ablest physicians of the sixteenth century, was born at Fontenay-le-Comte, in Poitou, in 1478. He studied at Paris, and, having taken his doctor's degree, bent his thoughts on reforming physic, by restoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabians; for which purpose he publicly explained Galen's works, instead of those of Avicenna, Rhases, and Mesué. He afterwards resolved to travel to acquire the knowledge of plants; and going to Portugal, he practised physic in the city of Evora. His new method of bleeding in pleurisies, on the side where the pleurisy was situated, raised a kind of civil war among the Portuguese physicians, and was brought before the university of Salamanca, which at last gave judgment, that the opinion ascribed to Brissot was the pure doctrine of Galen. The partisans of Denis, his opponent, appealed in 1529 to the emperor, to prevent the practice, as being attended with destructive consequences; but Charles III. duke of Savoy happening to die at this time of a pleurisy, after having been bled on the opposite side, the prosecution dropped. He wrote an *Apology* for his practice, but died before it was published, in 1552, by his friend Anthony Luceus. Renatus Moreau printed a new edition at Paris in 1622, and annexed to it a treatise entitled

Brissot. *De Sanguinis Missione in Pleuritide*, together with a life of Brissot.

BRISSET, JOHN PETER, the chief of the *Brissotine* or pure republican party in France during the early stages of the revolution, was born at the village of Ouarville, near Chartres, in the Orleanois, on the 14th of January 1754. His father, who was a pastry-cook, gave his son a liberal education, and Brissot became an author when he had scarcely left college. He exhibited a decided predilection for politics, and displayed an early zeal for republican principles. The boldness of his writings against the inequality of ranks excited the displeasure of the government, and subjected him to a prosecution and imprisonment in the Bastille. Having been restored to liberty through the influence of the Duke of Orleans, at the solicitation of Madame de Genlis, he married one of the duchess's women, and soon afterwards went to England, with secret instructions, it is said, from the lieutenant of the police. Others assert that he came over to London to avail himself of the freedom of the press in conducting a periodical publication, the design of which was to enlighten the people of France on the subject of civil liberty. It is certain that he endeavoured to maintain himself in London by his literary talents; but the failure of this attempt subjected him to embarrassments, from which he was relieved by the liberality of a friend, and he then returned to his native country.

Having again rendered himself obnoxious to the government by an attack on the administration of the Archbishop of Sens, he escaped a second imprisonment by a journey to Holland. During a temporary residence at Mecklin he published a periodical paper called *Le Courrier Belgique*. In the beginning of the year 1788 he repaired to America; but on the approach of the revolution he returned to Paris, resolved to take an active part in the scenes which were just preparing. He commenced his revolutionary career in 1789, by the publication of some pamphlets, and particularly of a journal entitled *Le Patriote François*. He belonged to the *Représentation des Communes*, which was formed in the capital a short time previous to the memorable 14th of July. On the storming of the Bastille, the keys were deposited with him. He was elected president of the Jacobin Club; and, in consequence of his zeal and activity in the revolutionary cause, he was appointed by his colleagues a member of the *Comité des Recherches*, which served as the model of all those committees which were afterwards successively formed under similar denominations, and with similar objects; such as the *Comités de Surveillance*, *de Sureté Générale*, *de Salut Public*, &c. Of this committee Brissot was the president; and, while in this situation, he acquired a number of enemies. A French writer of the name of Morande published at Paris, in 1791, a periodical pamphlet, under the title of *Argus*, in which he assailed the character of Brissot with great bitterness, representing his conduct in the most odious colours, and even accusing him of robbery; an accusation which, there is reason to believe, was utterly calumnious.

On the flight of the royal family in 1791, Brissot, in concert with the Chevalier de Laclous, drew up the famous petition of the *Champ de Mars*, demanding the abdication of the king, which became the signal for a dangerous insurrection, that was with difficulty quelled by the interposition of the national guard. This circumstance is said to have been the occasion of his quarrel with M. de Lafayette, to whom he had previously been zealously attached. At this period the republican faction began to assume a consistent form, and to utter their sentiments with freedom and boldness. Brissot, who had been one of its first and most zealous apostles, was re-

turned a member to the National Assembly, in spite of the opposition of the court, to whom he had become extremely formidable; and from this time he displayed an implacable enmity to the king. The National Assembly attributing to Brissot talents which he does not appear to have possessed, appointed him a member of the diplomatic committee, of which he became the habitual organ; and in this capacity he was the constant advocate of the most violent public measures, and never ceased to demand a declaration of war against all the powers of Europe. In order to attain this object, it was necessary to remove the ministers, whose dispositions were favourable to peace. Brissot accordingly attacked them all, but particularly M. Delessart, who was at the head of the department of foreign affairs; and, by repeated denunciations, he at length succeeded in obtaining a decree of accusation against him. His place was supplied by Dumouriez, under whose administration war was declared against the emperor of Germany, on the 20th of April 1792. From this period, however, the political influence of Brissot began to decline. Robespierre, with whom he had previously been intimately connected, now declared himself his enemy, denounced him at the Jacobin Club as a traitor to his country and an enemy of the people, and continued to persecute him with unrelenting rancour, until he finally effected his destruction. Alarmed at the storm which was gathering around him, Brissot, in concert with the other leaders of his party, attempted to form a reconciliation with the constitutional royalists; but this attempt having proved abortive, he reverted to his former opinions and line of conduct, and continued to denounce to popular vengeance all those whom he knew to be attached to the king. But although his writings may naturally be supposed to have excited those dispositions among the people which gave rise to the atrocities of the times, he had no direct influence on the revolution of the 10th of August, which appears to have been planned and directed by Danton. He was chosen a deputy to the National Convention for the department of the Eure, where he played only an inferior part, and was continually exposed to the rancorous attacks of Robespierre. It was Brissot, however, who, as the organ of the diplomatic committee, obtained the declaration of war against England and Holland, on the 1st of February 1793. This may be considered as the last act of his political life; for from thenceforth he was only occupied in defending himself against his numerous enemies.

The party distinguished by the name of the *Mountain* had now acquired a complete ascendancy, and meditated the destruction of their opponents, the *Girondists*, to which latter party Brissot was attached. Having at length been proscribed, after the revolution of the 31st of May, he was arrested at Moulins while attempting to make his escape into Switzerland, sent to Paris, subjected to a mock trial before the revolutionary tribunal, and beheaded on the 31st of October 1793, at the age of thirty-nine.

Brissot was somewhat below the middle size, a little deformed, and of a feeble constitution. His countenance was pale and melancholy, and he affected an extreme simplicity in his dress. With regard to his intellectual character, his talents appear to have been much beneath his reputation, and he certainly possessed more zeal than judgment. Notwithstanding the violence of his writings, declamations, and public conduct, however, he was not deficient in humanity; and, in the intercourse of private life, his manners are said to have been mild and accommodating. As an author, Brissot has not much merit; his style is monotonous, verbose, and tedious; and, upon the whole, it is wonderful that, with such slender abilities, he should have acquired so great an ascendancy in public

Brissot.

Bristol. opinion. The best articles of his journal are said to have been written by his secretary Dupré. The following are the principal productions of his pen:—1. *Moyens d'Adoucir la Rigueur des Lois Penales en France*, Chalons, 1781, 8vo; 2. *Un Independant de l'Ordre des Avocats sur la Décadence du Barreau en France*, 1781, 8vo; 3. *De la Vérité, ou Méditations*, &c. 1782, 8vo; 4. *Le Philadelphen à Geneve*, 1783, 8vo; 5. *Théorie des Lois Criminelles*, 1781, 2 vols. 8vo; 6. *Bibliothèque Philosophique du Législateur, du Politique, du Jurisconsulte*, 1782–1786, 10 vols. 8vo; *Tableau de la Situation Actuelle des Anglais dans les Indes Orientales*, &c. 1784–5, 8vo; 8. *Journal du Lycée de Londres*, &c. published in monthly numbers, 1784, 8vo; 9. *Un Défenseur du Peuple à l'Empereur Joseph II.*, sur son Règlement concernant l'Emigration, &c. 1785, 12mo; 10. *Examen Critique des Voyages dans l'Amérique Septentrionale*, par le Marquis de Chatellux, 1786, 8vo; 11. *Voyages en Europe, en Asie, et en Afrique*, translated from the English, with notes, 1786 and 1790, 2 vols. 8vo; 12. *Nouveau Voyage dans les Etats-Unis de l'Amérique Septentrionale*, 1791, 3 vols. 8vo. To the first volume of this work was prefixed a life of Brissot, which was translated into English, and published separately in 1794. Besides these works, Brissot wrote a variety of pamphlets, and articles inserted in periodical publications, which it is unnecessary to enumerate. See the life of Brissot, above mentioned, and the *Biographie Universelle*.

BRISTOL, a city of England, partly within the boundary of the county of Somerset, and partly in that of Gloucester, though it is a county of itself; distant 119 miles from London, and 13 miles from Bath. It is situated in a valley, rather contracted, at the junction of the rivers Frome and Avon, which, by the construction of a canal and locks, have been formed into a basin, where vessels, which lay on the ground formerly at low water, are now kept constantly afloat. From this floating dock the ships are lowered by locks into the united stream, which joins the Severn a few miles below the city. Bristol is a city of extensive and beneficial commerce, and that with almost every part of the globe. The trade with the West Indies is the most considerable; that with Spain and Portugal, with the Baltic ports, with the Mediterranean, with Africa, and the East Indies, if inferior to that of London and Liverpool, comes next to the latter place. There are considerable manufactures also in and near the city, especially of glass, sugar, braziers and tin ware, snuff, tobacco, beer, soap, corn, spirits, vinegar, sugar refineries, white lead, and many smaller articles. It has, from its local position, an advantageous inland trade; and is a kind of emporium for South Wales, and the northern parts of Somerset, Devon, and Cornwall, to which there is a constant water conveyance; whilst by means of other canals goods are transmitted to the central parts of the kingdom. Many ships are built here; and the equipment of them, as well as the barges and trows for inland navigation, affords considerable employment to the labouring portion of the population.

Although this city dates its origin at a remote period, and some parts of it contain streets that are narrow, crooked, and gloomy, and many houses of an antiquated appearance, yet many parts are not behind any city in England in improvements of every kind. Several new streets and squares have been built of late years in the valley; whilst in Clifton, one of the parishes which compose the city, there have been constructed crescents, parades, and streets, which vie with the best in the metropolis, and, from their beautiful situation and prospects, far exceed them. Another of the parishes of this city, Bedminster, has also much increased in beauty of buildings, as well as in the number of its inhabitants. The city is governed by a mayor, two

sheriffs, twelve aldermen, and twenty-eight common council men, besides a high steward, commonly a nobleman of high rank, and a recorder, usually a lawyer of distinguished eminence. The guilds are thirteen in number, and the whole body of freemen many thousands, and the more so as every daughter of a freeman conveys by marriage the freedom to her husband. The two members for the city are chosen by the whole body of them. Bristol contains, besides the cathedral, eighteen parish churches and five chapels, with a number of places of worship for the several descriptions of separatists from the established religion. It has two scientific institutions, social establishments, and numerous societies for the laudable purposes of benevolence, in the formation of which all the jarring political and religious parties show an honourable rivalry. There are several markets, where provisions are supplied of excellent quality, in great abundance, and at very moderate rates. The inhabitants of Bristol are more distinguished for their steady prudence than for their adventurous spirit in commerce; hence, if the city has not made occasionally such rapid advances, it has gone on steadily, and scarcely ever suffered by extensive disappointments in its commercial pursuits, or been the victim of those crises and fluctuations which have frequently occurred in other trading towns.

The hot wells near this city were formerly higher in fame than at the present day, but the water is still in estimation for its purity, and large quantities of it are dispatched to distant parts of the world. The population of Bristol has made the same regular advances as are to be found in the other ports of the British islands. In our view we include the parish of Bedminster in the city of Bristol, because it forms a part of it, as much as Westminster or Southwark do of London. The number of inhabitants thus taken amounted in 1801 to 66,922, in 1811 to 76,952, and in 1821 to 95,758. According to all probable appearance this rate of increase must have continued since the last census, which will make the present population at least 105,000 persons.

BRISTOL, a seaport town, and capital of a county of the same name, in Rhode Island. It is a very pleasant town, finely situated and handsomely built. The harbour is safe and commodious, and the place has a considerable trade. In 1820, the shipping belonging to the port amounted to 10,701 tons. The trade is carried on principally with the West Indies and with Europe. Bristol possesses a courthouse, a jail, a market-house, a masonic-hall, a public library containing about 1400 volumes, and four places of public worship. Great quantities of onions are raised here for exportation. Mount Hope, which lies about two miles north-east of Bristol, within the township, is a pleasant hill, of a conical form, and famous for having been the residence of the Indian king, Philip. The population of Bristol in 1820 amounted to 3197. It is situated fifteen miles south from Providence, fifteen north from Newport, and fifty-six south-south-west from Boston. Long. 71. 12. W. Lat. 41. 38. N.

BRISTOL, a town of the United States, in Bucks county, Pennsylvania. It stands on Delaware river, opposite Burlington in New Jersey, and contains about one hundred houses. It is a great thoroughfare, and is noted for its mills of several kinds. It is situated about eleven miles south-south-east from Newton, and about twenty north-east from Philadelphia. Long. 74. 56. W. Lat. 40. 5. N. There are several other places of this name in the United States, but of inferior note.

BRISTOL CHANNEL, a portion of the Atlantic Ocean, on the coast of Great Britain, lying between the south coast of Wales and the counties of Somerset, Devon, and Cornwall, in England.

BRITAIN, OR GREAT BRITAIN,

British and Roman Period. THE most considerable of all the European islands, is situated between fifty and fifty-eight and a half degrees of north latitude. It is bounded on the north by the North Sea, on the east by the German Ocean, on the south by the English Channel, and on the west by St George's Channel and the Atlantic Ocean. From north to south it extends about five hundred and eighty miles in length; its greatest breadth, from the North Foreland in Kent to the Land's-End in Cornwall, is about three hundred and seventy miles; and its superficial area is computed at eighty-seven thousand five hundred square miles. The figure of this island is irregular, somewhat resembling that of a wedge, to which indeed it was compared by the ancients, from its gradually narrowing towards its northern extremity; and its whole line of coast is deeply indented by bays, creeks, and estuaries, which, notwithstanding its boldness and ruggedness in many parts, afford safe and commodious harbours. From its geographical position, therefore, no less than from its natural advantages, this island seems to have been destined by nature to become the seat of a great and powerful nation.

CHAP. I.

BRITISH AND ROMAN PERIOD.

Origin of the names Albion and Britain.—The Gauls, Kelts, or Celts.—Their migrations and incursions.—Portion of Europe occupied by them at the dawn of history.—Distinctive characters of the race.—Branches of the great Celtic family.—Celts the earliest inhabitants of Britain.—Followed by invaders of the Gothic or Teutonic race.—Predominance of the latter.—Aboriginal Celtic population of Scotland succeeded by the Gothic.—Condition of the Britons in the time of Caesar.—Druidism.—Character and habits of the Britons.—Commerce and War.—Roman Period.—Caesar's Expeditions.—Subsequent attempts of the Romans.—Aulus Plautius.—Ostorius Scapula.—Gallant struggle of Caractacus.—His defeat in South Wales.—Betrayed.—Aulus Didius.—Attack on Anglesea by Suetonius Paulinus.—Revolt of the Britons under Boadicea.—Campaigns of Agricola.—Extent of the Roman Conquests in Britain.—Introduction of Christianity.—Hadrian, Severus, and Caracalla.—Constitution of the Roman Provincial Government.—Usurpations of Carausius and Allectus.—Constantine.—Cruelties of Paulus.—Scots and Picts.—Their inroads and ravages.—Departure of the Romans from Britain.—Distresses of the Natives.—Arrival of the Saxons under Hengist and Horsa.—Saxon Conquest.

Various etymologies have been proposed of the words *Albion* and *Britain*; the former being the ancient name of the island; the latter that which superseded it, and in time became the appellation by which it was universally known.

Originally Albion was considered as only one of the British islands, and it is described as such both by Agathemerus and Ptolemy; but being by far the largest and most important of the group, the particular name was in course of time laid aside, and the general denomination used in its stead. The etymological origin of both, however, is involved in uncertainty. Some derive that of Albion from the Greek *Ἀλφειός* or *Ἀλπίος*, identical with the Latin *Albus* and the Sabine *Alpus*, signifying *White*, and being obviously mere variations of the Celtic *Alb* or *Alp*, which has the same meaning; conceiving, with Festus, that as the mountains which separate France and Italy were called *Alpes*, by reason of their snowy covering, so

this island was denominated *Albion* on account of the chalky cliffs and soil of its southern shores, which were the portions that appeared to those who viewed it from the coast of Gaul; and this conjecture derives some countenance from the fact that the ancient Britons themselves called it *Inis-wen* or *Eilanban*, the *White Island*. Others, again, have recourse to the Phœnician, in which *Alp* signifies *High*, and contend that the name *Albion* was originally bestowed upon the island by the adventurous navigators of Phœnicia, who first visited its shores, by reason of the bold and precipitous aspect of its headlands and coasts, and that hence it is descriptive, not of the colour, but of the *physical conformation*, of these coasts.

Of the word *Britain* a still greater variety of etymologies have been proposed. Nennius derives it from *Brutus*, whom he likewise calls *Brito*, the fifth in descent from Æneas. Camden supposes it a compound of *Brith* or *Brit*, a Celtic word signifying *painted*, and *rana*, a Greek word denoting a *region*; so that, according to him, the island was called *Britannia* from its being the *country of painted people*. Carte, founding on the circumstances that the ancient Britons called themselves *Prydhain*, and their country *Inis-prydhain*, or the *Isle of the Prydhain*, conceives that *Britanni* and *Britannia* are only latinized forms of the original word *Prydhain* in the British or Celtic tongue. Somner, disliking Camden's etymology, conjectures that *Britain* is derived from *brydio*, which in the ancient language of the island signified rage, and, according to him, was intended to indicate its position in the midst of a tempestuous sea. Whittaker is equally or even more fanciful than Somner, contending that the true etymon of the word is *brith*, *briet*, *brit*, *bris*, or *brig*, which he says means *striped* or *divided*. And Bochart, whose love of the Phœnician was such that he found it every where and in every thing, conceives that this island and some others near it were denominated *Barat Anac* by the Phœnicians, that is, the *country of tin*, which, contracted into *Bratanac*, passed from them to the Greeks and Romans, and ultimately emerged in the softened forms of *Britanni* and *Britannia*. This, at least, has the merit of ingenuity to recommend it. Of the others, that of Carte seems to us to be the most natural and probable; although it leaves unexplained the word *Prydhain*, the analysis of which is essential to complete the etymology. It has been assumed by some that the name was originally bestowed on the island by foreigners; and, on this supposition, they have endeavoured to resolve it into its elements, or at least to offer a conjectural explanation of the circumstance which led to its primary application. But for our own part, we see no grounds whatever for entertaining such a notion; and think it much more likely that foreigners varied, according to their respective idioms and modes of articulation, the name in use among the natives, than that they invented, applied, and rendered general a new one, constructed on a remote and fanciful analogy, and having reference to accessory circumstances or particular localities.¹

At the period when the Greek and Roman writers began to turn their attention to the west of Europe, they found it, from the remotest extremity of Ireland to the banks of the Danube, peopled by a race called Gauls, Kelts, or Celts, who, before the practice of tillage bound them to the soil, had overspread a large portion of Spain

British and Roman Period.

¹ Carte, *History*, vol. i. pp. 4, 5, 6.

in the course of their armed migrations, and, through the passes of the Julian and Rhaetian Alps, had poured predatory bands on the great plain of northern Italy, where they established themselves, and afterwards struck a heavy blow at the rising power of Rome, stretching their dominions as far as the Appennines. This remarkable race, believed with reason to be of oriental origin, extended along the Danube till they reached the Sarmatians on the one hand, and the Thracians and Illyrians on the other; and from the central position which they thus occupied, they appear to have diverged by various natural channels to the different countries of Europe where their descendants are still to be found. How they came to establish themselves originally in such a position is uncertain. Their early migrations, undertaken for plunder rather than conquest, occurred anterior to the period of history; and we have but slender grounds for probable conjecture respecting either their extent or their antiquity. But some of the later incursions of this people into Italy and Greece are fortunately better known to us. A numerous body of Gauls, for example, deserting the bands of their countrymen who ravaged Greece, established themselves in Asia Minor under the successors of Alexander, and gave their name to the country they occupied, which was accordingly called Galatia. In the opinion of some, this body of invaders consisted wholly of Celts, while others maintain that they were of the Teutonic race; but it seems at least equally probable that they were composed of both races. With regard to the causes which produced these fierce and extensive irruptions, the learned have lost themselves in speculation, and wearied their readers with endless conjectures. The motives which led to them were in all likelihood different at different times, and they may therefore be variously ascribed to the restless and adventurous spirit of such tribes, to the ambition and rapacity of their chiefs, to the necessity which, after a certain period, urges on an unproductive race to seek new settlements, or to the resistless pressure of invading barbarians from behind, or perhaps to the simultaneous operation of several of these causes.¹

The Rhine formed the northern boundary of the Gauls, and separated them from the Germanic or Teutonic race, which spread into Scandinavia, towards the last retreat of the Finnish tribes in the Arctic solitudes, and extended, on the other side, from the shores of the Atlantic to the vast plains inhabited by the Sarmatians and Dacians. The Garonne divided them from the Aquitanians, a people who, from various circumstances, as the testimony of the ancients, and the names of rivers and mountains, appear to have been the original inhabitants of the Spanish peninsula; whilst a portion of this primitive Iberian race occupied the southern coast of Gaul from the Pyrenees to the frontier of Italy.

The intermingling, followed by the gradual fusion and amalgamation of the various races by which most countries have been successively overrun, renders it exceedingly difficult, if not impossible, to discriminate the first inhabitants from the more civilized visitants, as well as to distinguish between the different tribes of the latter. Greece, from its position near the earliest seats of civilization, was open to conquest and colonization from numerous points both by sea and land; on the side of Thracæ, on that of Asia Minor, from Egypt, and from the countries of the East. Europe, Africa, and Asia, appear at different times to have discharged portions of their population into this favoured spot; and hence has arisen the difficulty of ascertaining the number, and much more of

detecting the peculiarities, of each successive immigration Italy, again, being accessible to colonists by sea from Greece, Asia Minor, and Egypt, and always exposed to the inroads of the tribes who inhabited or were able to make themselves masters of the principal passes of the Alps, was occupied by a greater diversity of races than any other country of the West; and hence has arisen a confusion in the genealogy of its tribes, which even the profound sagacity and varied learning of Niebuhr have not succeeded in disentangling. Population appears to have originally flowed into this country from its two extremities; but in process of time the opposite streams met, and became so thoroughly intermingled, that no moral or intellectual chemistry can ever decompose them. With regard to the colonies of the Phœnicians, they encircled the Mediterranean as far as Carthage and Cadiz, whilst no Grecian colonists had as yet established themselves farther to the west than Massalia, Massilia, or Marseilles. In circumstances and times like these, the natural boundaries of nations were often irregularly changed. The course of migration was frequently diverted from its ordinary channels, and sometimes forced back towards its original source. Races were mingled so that their distinctive marks became no longer discoverable; and even languages were changed, or altogether disappeared. Of this confusion the Galatians in Asia Minor, and the Celtiberians in Spain, afford examples. Even the Belgic inhabitants of northern Gaul have been thought a mixed race, and it seems pretty certain that, from whatever cause, Teutonic tribes were generally classed amongst them. Again, although the natural tendency of an unwritten language be to break down first into dialects and afterwards into distinct languages, yet languages originally different sometimes run into each other, and coalesce in a very remarkable manner. Of this the Hindustanee and Anglo-Norman have afforded examples at the opposite extremities of the globe, both having been formed out of jargons used in intercourse between the conquerors and the conquered. The victors sometimes impose their language, with little mixture, on the vanquished; but in India every variety of dialect has been deeply tinted with Sanscrit, the original as well as the sacred language of that country; and nothing can be imagined more heterogeneous or dissimilar than the roots of most of the forms of speech which actually obtain in it.²

It may not be out of place to observe here, that the term race, as used in civil history, has a very different acceptance from that which is given to it by naturalists. The latter, confining their view to the physical form and organization of man, and making no account of language, and of those other minor varieties and peculiarities which the civil historian is obliged to notice, admit at present only five races of men; the Caucasian, the Mongolian, the Ethiopian, the American, and the Malay. Colour is considered as one of their tests or characters. The Caucasian is accounted the primitive stock, and it deviates into two extremes, equally remote and different from each other, namely, the Mongolian and the Ethiopian. But although the Mongol and the Negro differ from the European much more deeply and radically than the Hindu and the Arab, yet if the lesser difference be admitted to be the result of physical causes, operating throughout a long tract of ages, it will be difficult to prove that the greater may not at length have been produced by similar causes acting during a greater period of time. Be this as it may, however, it must be obvious that, from lengthened separation, and the natural divergency of language, the historical divisions

¹ Mackintosh, *History of England*, vol. i. *Introd.*

² Mackintosh, *ubi supra*.

British and Roman Period.

of mankind become broken into portions or subdivisions not always corresponding with the political distribution of territory among nations, and that, as the same state may contain tribes of various race, so the same race may be subject to many distinct rulers.¹

The Celtic race may be considered as subdivided into two distinct portions, with languages which, though certainly derived from a common stock, are not, it is believed, reciprocally understood. One of these cognate languages or dialects, called the Gaelic, is still spoken by the native Irish, by the Highlanders of Scotland, and in the Isle of Man; the other is the common speech of Wales and Lower Bretagne, and, till a period comparatively recent, it was spoken in Cornwall; whilst, in each branch or subdivision, the parent language seems only to differ by provincial variations, which, accumulating in a long series of ages, have produced a greater divergence than is generally found to exist between affiliated dialects. The Gaulish tribes are unable to converse with the Cimbric, yet there is abundant evidence that the Gaelic and Cymraig or Welsh are branches of the same family. Indeed it is supposed by some that the Cimbric or Cymraig followed, at a considerable interval, the Gaulish settlers; and it seems not improbable, that the tribes who spoke this form or dialect of Celtic were, as Sir James Mackintosh observes, "the same Cimbri who, in conjunction with their Teutonic allies, were expelled from the Roman territory with a slaughter so enormous, and after atrocities so unmatched, as to be suspected of exaggeration;" although it should be borne in mind "that the adversaries of the Romans were not armies, but migratory nations, bringing into the field women and children, and fierce animals," which all contributed to swell the horrors of the butchery, and first taught the Romans to dread the arms of the northern barbarians.²

That the aboriginal, or at least the earliest inhabitants of these islands were a people of Celtic origin and race, seems to be admitted on all hands, and is rendered highly probable, both from the intimations of history and the evidence of language. The former leave little doubt that the migrations and settlements of the Celtic tribes preceded those of the Scythian or Gothic nations by whom they were almost everywhere displaced; and this conclusion derives additional probability from the consideration, that the greater part of the names of mountains, lakes, and rivers, in both the British islands, are still descriptive and significant in some dialect of the Celtic language. "The appellations of these vast and permanent parts of nature," says Sir James Mackintosh, "are commonly observed to continue as unchanged as themselves." Of all the languages that ever existed, the Celtic is perhaps the richest in an appropriate and expressive nomenclature for physical objects; and the facility with which its elementary forms admit of combinations descriptive of the varieties observable in external nature, must have greatly tended to impress and perpetuate the appellations which it originally supplied. Hence it is that, after the revolution of ages, and the fluctuations of conquest, dominion, and race, together with all the changes which time and usage insensibly operate in language, the names in question are still distinctly traceable; whilst the extent to which they still obtain in both parts of Britain seems to argue the original ascendancy of the race from whose language they were derived. Had the Gothic preceded, instead of following, the Celtic colonists, the case would in all probability have been exactly, or at least very nearly, the reverse of this. As it is, however, the fact here mentioned appears to be

incompatible with any other supposition than that of Britain being originally peopled by a Celtic race; and as the Gaelic dialect explains many more of the names of external objects than that spoken by the other branch of the race, the same principle leads us to conclude, that those who employed that variety of the common or parent language were the first settlers. Beyond these probabilities the most ancient period of our history is involved in impenetrable darkness.

To the Celtic population of Britain succeeded the Gothic, by whom they were, at a very early period, displaced to a considerable extent. Advancing from the northern parts of Asia and Europe, where they had enjoyed a wild independence, the Scythians or Goths drove the Cimbri or northern Celts before them, and, seizing upon that part of Gaul which is nearest to Britain, they crossed over into England. The period of this immigration is uncertain; but at the time of Cæsar's invasion, the primitive or Celtic inhabitants had been driven into the interior and more inaccessible parts of the island, while the south-eastern portion was peopled with colonies of Gothic descent, who may, therefore, be regarded as the chief ancestors of the English nation. The expulsion of the aboriginal population from the south-eastern coasts and lowland districts of the whole island was complete; so much so, in fact, that, but for the tenacity with which the names of natural objects adhere to them, and some other indications of a still fainter kind, not a trace or vestige of their original ascendancy would have remained. The Saxon conquest was of a different character. The invaders, considerable in number, sought political supremacy rather than a settlement by means of extermination, and used the privileges of conquest with more moderation than their predecessors of the same race. There no longer existed between the conquerors and the conquered that radical diversity of physical conformation, habits, and customs, which, in a barbarous age, is the source of inextinguishable hostility; they accordingly enslaved, but forbore from exterminating or utterly expelling the natives; a gradual amalgamation took place; and, from the commingled Gothic dialects of both, at length sprung the Anglo-Saxon, which is the parent of the English language. Some, indeed, have maintained that, at the period of Cæsar's invasion, the population of Britain still continued Celtic. But this opinion labours under serious objections. The Anglo-Saxon and the English language, in its elder and simpler form, exhibit scarcely a trace of Celtic in their composition; and they have even less of that peculiar dialect of Gothic which the Angles and Saxons must have spoken at the period of their arrival in Britain, than of the Belgic and Dutch dialects, which are in all probability of Scandinavian origin. To this it may, indeed, be objected that Druidism, which is rightly considered as a Celtic superstition, is mentioned by Cæsar in the earliest authentic records of the island which has reached our times. But, in the first place, Cæsar never speaks of having actually seen Druids, nor does it appear that any one of this class of priests was discovered until the Romans had penetrated into South Wales; and, secondly, forms of superstition often survive the races or nations amongst which they originated, and pass indifferently from the conquered to the conquerors, and conversely, by the operation of causes totally distinct from those which determine the fate of communities of men.

The expulsion of the Celts from the eastern coast of Britain long preceded the arrival of Cæsar. This may be inferred from the account of Tacitus, whose description

British and Roman Period.

¹ Mackintosh, *Hist. of England*, vol. i. p. 12.

² History, *ibid.*

of the inhabitants of the lowland parts of Scotland as a red-haired and large limbed race, clearly indicates their Gothic origin; whilst, in the interval between Cæsar and Agricola, no material change appears to have occurred in the relative distribution of the various tribes by whom Scotland was then inhabited. It would be vain to attempt to ascertain the epoch of a revolution which seems to have been effected long anterior to the period of history; but if the time of its occurrence be uncertain, the fact itself is nevertheless indisputable; and this is connected with another, sufficiently remarkable, namely, that every trace or vestige of the original Celtic population of the Lowlands has been obliterated, and that there is neither monument, record, tradition, nor circumstance of any kind which can lead to a conjecture as to their fate. It is natural, indeed, to suppose that in Scotland, as elsewhere, those who escaped the fury of the invaders sought shelter in the mountains or Highlands, where a people chiefly Celtic still exists; but it seems as well established as any fact of the kind can ever be, that the occupation of the Highlands by a Celtic population does not date much earlier than the sixth century, and that the first settlers of this race were a reflux of the Celts from Ireland, not a remnant of the aboriginal inhabitants of the Lowlands. The Dalriads or Attacotii are indeed said to have established themselves in Argyleshire about the middle of the third century; but they were driven back to Ireland in the fifth century, and did not return till the following one, when they effected a second and permanent settlement. Extravagant pretensions to antiquity have, it is true, been set up in favour of the Celtic Scots by Boyce, Buchanan, and others, who gravely affirm that this people reigned in Scotland a thousand years before the Christian era. But the fabulous millennium with which these writers gratified the credulous nationality of their countrymen in an uninquiring age has found no supporters in more modern times.

The condition of the Britons in the time of Cæsar very much resembled that of the Gauls from whom they sprung. They were divided into a number of petty kingdoms or states, each of which was again subdivided among subordinate chieftains, who governed their respective tribes or clans with more than feudal authority. On great emergencies, indeed, they united under a common leader; but this "king of kings" had only a limited and precarious rule; and the confederacies of the ancient Britons, like those of the ancient Greeks, were neither numerous nor lasting. Like the mutually repellant atoms of the Epicurean philosophy, their union was fortuitous; and as there existed no principle of compression to retain them in the situation into which accident or a sense of common danger sometimes threw them, a separation speedily followed. It was this which gave the Romans so great an advantage in their contests with these warlike nations. Never consulting together for the benefit of the whole, it was rare that even two or three of them united against the common enemy. They fought, for the most part, separately, and, as a necessary consequence, were beaten in detail. Of the limits of the regal authority among the Britons little is known with any degree of certainty, though much probably depended on the personal character of the individual who exercised it. Hereditary right seems to have been recognised, and extended even to female succession, but it was not strictly observed or enforced; and instances were not rare of the exclusion of a son by his father, whom he had offended, from any share in his dominions. It has been conjectured that the power of the people was considerable; but this is merely conjecture. Among the Gauls the few had not succeeded in excluding the many from all participation in the conduct of their own affairs. But whether the Britons resembled them in this respect or not, it

is difficult to say. From all that we learn, however, we are inclined to think that here the similarity failed.

But whatever may have been the power of the kings or the influence of the people, there existed an order which exercised an authority paramount to that of either, or of both united. This was the Druidical or sacred caste, which, in relation to the rest of society, occupied a station and enjoyed privileges in Britain, analogous to those possessed by the Brahmins of India at the period of their greatest glory. The power of the Druids was absolute, exclusive, and peculiar to them as a body. Their sanction was necessary to all public transactions, which otherwise were of no validity. They could pardon malefactors who had been judicially condemned, or ordain victims to the sacrifice without the intervention of any trial or judgment but their own. From the Druids the Romans seem to have borrowed the *aque et ignis interdictio*, which became the most terrible sentence of their law. It was, in fact, the Druidical excommunication slightly varied. An individual debarred from attending the holy rites, and interdicted the use of fire, received sentence of eternal banishment from the fellowship of his kind; and this sentence, more formidable than the excommunication of the Roman Catholic church in aftertimes, they could pronounce at pleasure. Their ceremonies were at once mysterious and inhuman. The mistletoe, which they accounted peculiarly sacred, was gathered by them from the leaves of the oak with circumstances of extraordinary solemnity, though for what purpose or with what view is unknown. They dwelt in the centre of concentrated woods, and their retreats were defended from intrusion or violation by the power of a dark and gloomy superstition. On their rude but horrid altars they sacrificed human victims; and from the course of the blood as it flowed under the knife of the officiating priest, they prognosticated future events. They were the lawgivers, physicians, poets, and philosophers of their country. They are said to have been acquainted with letters and the art of writing, though in what particular form is uncertain. Cæsar, probably from misinformation, says that they employed the Greek letters, which is very improbable. They taught their disciples the doctrine of transmigration, and inculcated on them the duty of despising death in defence of their country. They practised celibacy, and continued their order by kidnapping children, whom they trained up and initiated in their mysteries. Some of their observances are described as excessively revolting; others would seem to have been of a more innocent and even humane character. Britain was the great sanctuary of this superstition. Originally imported from Gaul, it seems to have found a congenial soil in this country, where it struck its roots so firmly, and insinuated itself so deeply, into the general character, that traces of it are still discoverable in several of the popular superstitions which the "schoolmaster" has not yet succeeded in effacing.

The Druidical system is not without oriental features. "So much subserviency of one part of a nation to another," says Sir James Mackintosh, "in an age so destitute of the means of influence and of the habits of obedience, is not without resemblance to that system of ancient Asia, which confined men to hereditary occupations, and consequently vested in the sacerdotal caste a power founded in the exclusive possession of knowledge. The Egyptian and Phœnician colonists who settled in the Hellenic territory were, by some fortunate accident unknown to history, set free from those Asiatic restrictions which, having probably long subsisted as usages, were at length sanctioned among their ancestors by law and by religion as the sole security against a relapse into unskilfulness and barbarism." But the Celtic colonists who originally settled in Gaul and

British and Roman Period. Britain were not equally fortunate. Having imported, long before the period of record, the oriental system, with its restrictive and stationary spirit, they submitted to its yoke in their new settlements, where it withstood the example of a more generous polity afforded by the neighbouring republics of Hellenic origin, and only yielded at length to the ascendancy of the benignant genius of the Christian religion.

The prevalence of such a system is, even under the most favourable circumstances, incompatible with an advanced state of civilization; and in Britain it co-existed with a condition of society which, anterior to the Roman occupation, was but little elevated above absolute barbarism. The south-western shores of the island had, it is true, been early resorted to by foreigners for purposes of traffic; the Phœnicians and Massilians, for example, traded in the tin of Cornwall, and from them geographers spoke of the Cassiterides or Tin Islands; but this traffic was too limited in extent, and too confined in its sphere, to have any material influence on the general character of the people, who accordingly derived small benefit from their occasional intercourse with foreigners. Their scanty clothing consisted of untanned skins; and the parts of the body left exposed were bedaubed with an azure colouring matter extracted from a particular herb. Tillage, which had been introduced by the Belgic Gauls, was not altogether unknown; but the principal articles of food were the milk and flesh of their herds. Superstition, with its usual blind absurdity, had forbidden them the use of fish, which abounded on all the coasts of the island. Their towns were merely clusters of wigwams, covered with turf, boughs, or skins, and situated in the midst of some forest or morass, with the avenues defended by ramparts of earth and felled trees. In their persons they were large and tall, excelling the Gauls alike in stature and in strength; but their features were heavy, their figures clumsy, and, according to Strabo, they did not stand firm on their legs. Large men, indeed, are seldom handsome or elegantly formed. But although barbarians in point of art and industry, the ancient Britons commanded respect by their intellectual and moral qualities. According to Tacitus, they possessed a quicker apprehension than the Gauls; and Diodorus Siculus commends their integrity as greater than that of the Romans. A custom abhorrent to natural morality is indeed said to have prevailed amongst them; we are told that societies of ten or twelve persons possessed wives in common. But the supposition of such a custom might be easily, though erroneously, formed, by a Roman stranger, from the circumstance of the barbarians sleeping promiscuously in their hovels, as the peasantry do to this day in some parts of Scotland; and the fact, when rightly understood, by no means warrants the conclusion which seems to have been drawn from it. On the contrary, the chastity of the sexes, and the purity of domestic intercourse, may have been as rigidly observed and maintained among these simple barbarians as in periods of society when the guards of virtue are multiplied, and modesty is sheltered by factitious sentiment and conventional ceremony.

The trade in tin of Cornwall, carried on either directly or indirectly by the Phœnicians and Massilians, has been already noticed. Prior to the Roman conquest, however, the exports must have been inconsiderable; and it is even doubtful whether those early navigators were acquainted with the mainland of Britain, since we hear only of the Cassiterides, or adjacent islands, to which their mercantile adventures appear to have been confined. But after the Romans had firmly established themselves in their conquest, copper, tin, lime, chalk, pearls, corn, cattle, hides, horses, cheese, dogs, and slaves, began to be exported by

them, and we may conclude that the products of other countries were imported in return or exchange for these commodities. The only manufacture we read of was that of baskets, in which, as we learn from various authorities, the Britons greatly excelled. Some of the more useful but baser metals seem not to have been found in Britain before the time of Cæsar, who informs us that even their brass was imported; and their skill in manufacturing such as they had must have been very small indeed, since, as we learn from the same authority, their ornamental trinkets were supplied by strangers. But their warlike habits had not left them ignorant of the coarser craft of the armourer. Man has never been found, in any state or condition of his existence, altogether unprovided with weapons of defence. Those of the Britons consisted of small targets and swords, spears, and chariots armed with iron scythes projecting from the extremities of the axle-tree; and they were also provided with noisy rattles, intended to strike terror into their enemies. Their chariots they managed with considerable dexterity, and, on several occasions, succeeded in breaking the Roman line by means of these vehicles; but, on the whole, they proved unavailing against the admirable discipline of the legions, and were no more heard of after the Romans gained a footing in the island. It is even wonderful that they should ever, in any instance, have been found in the least degree dangerous or formidable, except to the Britons themselves; for as these vehicles could only act on level unbroken ground, and as the extreme mobility of the legion gave it the choice of its own position, whether for attack or defence, nothing but the grossest misconduct on the part of its commander could ever have placed it in a situation to be successfully assaulted by such clumsy and unmanageable engines.

Such are the principal notices supplied by historians respecting the ancient inhabitants of this country prior to the Roman conquest. The first events in the authentic history of Britain are the landing of Cæsar on the southern shores, in the fifty-fifth year before the Christian era, and his invasion of the country in the following year. The course of his conquests in Gaul had brought him in sight of an island hitherto known only by name, and, being probably desirous of dazzling the people of Rome by a new achievement, as well as of seeming to be engaged in objects remote from internal aggrandizement, he resolved on attempting a descent upon this unexplored region, on the pretence that the Britons had rendered some assistance to the Gauls in their struggle for independence. Another and more secret motive for this expedition may have been, that it would enable him to prolong his provincial command, and, above all, to keep up an army devoted to its chief, until the fulness of time should come for the execution of his projects against liberty. On the first occasion, when he disembarked near Deal, his landing was warmly disputed by the natives; but discipline and skill at length prevailed over wild valour, and after a sanguinary struggle the Britons were defeated, and forced to sue for peace. Deputies were accordingly sent to lay their submission before Cæsar, and learn the conditions on which they were to be forgiven for the crime of defending their native soil. But having ascertained the number of the invaders, and learnt that accidents arising from ignorance of the navigation had damaged the Roman fleet, they acceded to whatever terms Cæsar thought proper to dictate, and secretly resolved to renew the attack. They were again repulsed, however, though not without inflicting a severe loss on the enemy; and Cæsar, surprised at the resistance he had encountered, as well as anxious to secure his return to Gaul, which the approach of winter had endangered, readily accepted the nominal submission proffered by the islanders. Thus ended the first descent of the Romans

British
and
Roman
Period.

on Britain. After a brief but fierce struggle of little more than three weeks, Cæsar embarked his whole army, and returned to Gaul, glad to escape from a situation where his means were insufficient to enable him to keep his ground, and where the slightest reverse would undoubtedly have proved fatal.

In the ensuing spring the same commander again appeared on the British coast, with an armament of 800 vessels, having on board five legions and 2000 auxiliary horse. The sight of so formidable a fleet made the Britons despair of resisting the landing of the invaders, and they accordingly withdrew to their forests, where they could act with better chance of success. The Romans, therefore, disembarked without opposition, penetrated into the country, and passing the Thames above Kingston, entered the country of the Trinobantes, whose territory included the site of the present metropolis of Britain. The advance was bravely disputed, and in the course of this forest campaign, the military qualities of the invaders were put to a severe trial, by the incessant activity, the daring courage, and the rapid movements of the hardy natives. Cassivelaunus, a British chief, particularly distinguished himself by his gallantry and enterprise, as well as by a natural talent for war, which was strikingly exhibited in the bold design of cutting off Cæsar from his fleet. But genius and science asserted their usual superiority. The Britons were at length vanquished; and the chiefs having promised to pay tribute, and to abstain from hostility against those of their countrymen who had abetted the Romans, the latter withdrew, content with the barren glory of having gained a victory without result, and conquered a country which they could not retain. In fact, it is not easy to divine the real object of these expeditions. It has been said that Cæsar showed no signs of an intention to establish himself in Britain, and probably regarded his expeditions only as a means of flattering the Romans, and of displaying the complete reduction of Gaul. This may be true; but it was never the character of Roman policy to fight useless battles, or lavish unprofitably the blood of the legions. The more probable supposition appears to be, that Cæsar considered the entire conquest and subjugation of a country covered with forests, without roads, and inhabited by a hardy, warlike race, as a hopeless task, or at least as one which, in his particular situation, and with the means at his disposal, it would be unwise or imprudent to persevere in. One benefit, however, resulted from his enterprise; he first laid open the country to history, and collected those invaluable notices of the character, condition, habits, manners, customs, and religion of the people, which he has preserved in his Commentaries, and which still afford instruction and delight to every reader.

Britain was threatened with invasion by Augustus, who thereby extorted presents and tribute from the insular chiefs; Tiberius employed no menace, but exacted the tribute; and Caligula, in one of his insane freaks, landed at the head of a body of troops, whom he commanded to charge the ocean, and collect cockle-shells as fit emblems of his imaginary triumph over that boisterous enemy. The visit of the imperial madman took place ninety years after Cæsar's expedition, and formed a subject of derision to the whole Roman world. But the next attempt was of a more serious character, and productive of graver results. In the reign of Claudius, the adventurous and hitherto unprofitable enterprise was resumed under two distinguished officers, Aulus Plautius and Vespasian, who, landing at the head of an army 50,000 strong, marched through the territories of the Cattivelauni, and defeated Caratacus and Trocodumnus, the British leaders, in three successive engagements. But the retreating enemy was still

too formidable to be seriously passed; reinforcements were demanded by the emperor's lieutenants; and seven years elapsed before they succeeded in reducing the country southward of the Thames. This partial conquest cost the blood of thirty battles, in which the Romans were not always victorious.

Ostorius Scapula, who succeeded Aulus Plautius in the provincial government of Britain, extended the province to the banks of the Severn, and built a chain of forts to check the incursions of the independent tribes. But Caradoc or Caractæus still lived. This renowned chief had lost his dominions; but, notwithstanding all his reverses, the ascendancy he had acquired over the minds of his countrymen remained unshaken, and, great in adversity, he was still formidable. Despairing of success in the open country, he transferred the war to the mountains of Wales, and at the head of the Silures and other tribes, who had arms in their hands and the love of liberty in their hearts, he prepared to make another effort in defence of his country. The position he selected for this final stand shows him to have been possessed of that instinctive military genius which anticipates science and often defeats its combinations. It consisted of a rising ground or eminence, with a rapid and scarcely fordable river, which it commanded in front, and was incapable of being turned by either flank, whilst its defensive strength was increased by a stone rampart built along the brow of the hill. Here he resolved to await the attack of the Romans; and exhorting his followers to remember that Cæsar himself had been driven from the shores of Britain, he called upon them to maintain by their valour the liberty which they had inherited from their ancestors. They vowed fidelity to the cause of their country, and promised that they would conquer or die where they stood. The Roman general was astonished. He saw that he had to encounter a desperate enemy, skilfully posted, and unassailable except where his position was strongest; and, in viewing the difficulties of his situation, his mind almost misgave him. But the spirit of his soldiers was roused, and they cried out that no position was impregnable to the brave. Having forded the river with extreme difficulty, they formed the *testudo*, or close column, covered overhead with their shields, to protect them from the missile weapons of the natives; ascended the hill in this compact order; broke through the rampart of loose stones; and charging home upon the Britons, overthrew them with great slaughter. The brothers of the British prince surrendered; his wife and daughter were made captive; and the hero himself, who had escaped the casualties of the field, and taken refuge among the Brigantes in Yorkshire, was afterwards basely betrayed into the hands of the enemy by their queen Cartismandua, his inhuman stepmother. He was sent captive to Italy, whither the fame of his achievements had preceded him; and the people flocked to behold the man who for nine years had defied the power of Rome. His family supplicated for mercy; but the magnanimous chief, sustaining in misfortune true greatness of character, stooped not to prefer any solicitation, and, addressing the emperor with a manly dignity, equally removed from abject submission and insolent defiance, made so great an impression on the mind of Claudius, that his fetters were ordered to be struck off, and both his family and himself treated with the most distinguished regard.

Meanwhile the Silures, beaten but not subdued, renewed their attacks on the Romans, and kept up the animosity of their countrymen by their example. They cut to pieces some cohorts employed in building forts in their country; harassed the enemy with continual skirmishes; and, although defeated in a general action which they afterwards risked, they escaped without entire rout under

British
and

Period.

cover of night. Weary of an obscure and destructive warfare, barren of glory and productive of little save fatigue and anxiety, Ostorius died, and was succeeded by Aulus Didius. The latter checked the incursions of the Britons, who had again become formidable under a new leader; but not till after they had defeated a Roman legion, and reaped some other advantages of a minor description. Unfortunately for himself, however, Venusius, the leader in question, and chief of the Huicci of Warwick and Worcestershire, had married the betrayer of Caracatus, a woman as licentious in her personal conduct as she had proved herself devoid of principle or patriotism. Having scandalized her subjects by admitting Villocatus, her armour-bearer, to a share of her bed and throne, Cartismandua implored the aid of the Romans against her husband, who had collected a force to expel the usurper. But the promised assistance proved too scanty for the protection of the adulteress, who, in the end, was driven from her kingdom; and although this civil war operated as a seasonable diversion, the efforts of the Romans were for several years confined to the preservation of what they had already acquired.

But the season for action in due time arrived. Suetonius Paulinus, an officer of high reputation, but ambitious, and prone to cruelty, having obtained the province of Britain, resolved to destroy the sacred seat of Druidism in the island of Mona or Anglesea, where the head of that order resided, considering it as the centre of the British nation, and the source whence emanated that spirit of resistance which had already cost the Romans so much blood. The project was equally bold and well conceived. Having crossed the strait, however, he found a host drawn up in order of battle to receive him, the declivities bristling with arms, soldiers occupying every defile, and women, in funeral apparel, running along the ranks like furies with burning torches in their hands, whilst Druids clustered around, imprecating the wrath of heaven on the sacrilegious intruders into their holy of holies. Awed by the spectacle, the legions for a moment stood powerless; but ashamed of their momentary panic, they rushed forward to the attack, drove all before them, and, after demolishing the altars and groves, burned the Druids in their own fires.

In the midst of this havoc, however, Suetonius received intelligence of a general insurrection of the conquered tribes. The immediate causes of an outbreking so little expected were the gross injustice done to the family of Prasutagus, king of the Iceni, and the atrocious outrages offered to his queen Boadicea, who, having remonstrated against the fraudulent exheredation of her children, was publicly whipped, and constrained to witness the violation of her daughters. Wrongs so great, and insults so intolerable, required not the general spoliation which followed to kindle up the spirit of an indignant people, and to turn their vengeance on the oppressors. The standard of the injured queen was raised, and numerous tribes rallied round it. The infant colony of Camelodunum (Malden or Colchester) was destroyed; the infantry of the ninth legion were annihilated; and in the more flourishing colony of Verulamium (St Alban's) seventy thousand persons are said to have been put to death with all the cruelties of a barbarous revenge. Suetonius flew to the assistance of his countrymen, and soon succeeded in bringing the Britons to a general action on open ground, where their superiority in point of numbers was of little avail against discipline and science. They were defeated with prodigious slaughter, whilst the victors, by their own account, lost only five hundred men. The disproportion was doubtless

great; but this is probably an exaggeration in both directions. The Britons seem to have fought gallantly, though not successfully; and hence the historian says, that "the glory won on that day was equal to that of the most renowned victories of the ancient Romans," a statement inconsistent with the notion that it had been either easily or cheaply purchased. Boadicea ended her miseries by taking poison; and Posthumus, the commander of a legion, fell on his sword, indignant at not having a share in so glorious a victory.¹

Broken by this blow, the spirit of the Britons would have soon been quenched had it not been kept alive by oppression. Suetonius, with all his abilities, was injudiciously vindictive, and frequently lost by his cruelty the advantages which he had gained by his talents. He was therefore recalled by Nero; and, under his more immediate successors, the Britons enjoyed a short interval of repose. But the Roman energies revived under Vespasian, who had gathered his first laurels in Britain. The Brigantes, commanded by Venusius, were at length overcome; and the Silures, after a gallant but hopeless resistance, were in like manner subdued. In this double contest Cerealis and Frontinus employed no less than seven years, a fact which sufficiently indicates the persevering energy with which these powerful tribes contended for independence.

These successes paved the way for the subjugation of the greater part of the island under Cnæus Julius Agricola, who was now appointed to the government of the province. The administration of this distinguished Roman would probably have been as little known to us as that of any of his predecessors, if it had not been for the circumstance of having as his son-in-law the most able and philosophical of the ancient historians; "a singular instance," as Sir James Mackintosh observes, "of the power which genius, in ages where historical materials are scanty, may exercise over the allotment of fame." In the character of Agricola is exhibited an example of the union of great capacity for war, with prudence, moderation, and judgment in the administration of civil affairs. "His well-balanced mind," says the very eminent writer just cited, "was averse from all excess, but it was without those brilliant peculiarities in which the biographer delights. The only general maxim by which the historian attempts to exalt his character is, that there is a conduct, even under tyrannical reigns, equally distant from servility and turbulence, by which an eminent man may serve his country with safety and innocence. The work in question ought rather to be regarded as the funeral panegyric than as the life of Agricola. The age of Tacitus afforded him few opportunities to acquire a talent for praise by frequent exercise: his style did not easily descend to ordinary particulars; and his affection in this case cramped his freedom." Hence the indistinctness of the outline presented to us by the historian may be ascribed both to the generality of his language and to the limits of his information; circumstances often render it difficult to extract a precise meaning from his words, and, particularly, to fix the localities of some of the most interesting events he relates.

Agricola began his military career in Britain by subduing the Ordovici of North Wales, and reducing Mona, which, after the fierce vigour of Suetonius was withdrawn in consequence of the insurrection under Boadicea, had regained its independence and religious pre-eminence as the grand seat of Druidism. This he effected without the aid of ships, by causing a sufficient force to swim across the narrowest part of the strait with their arms and horses, but unencumbered with baggage. In his second campaign

Period.

he carried his arms to the northward, and subdued tribes who had never as yet come into contact with the Romans; showing clemency to such as submitted to the power of Rome, and never, in any instance, abusing victory for purposes of cruelty or oppression. To secure these advanced conquests, he built a chain of forts or military stations from sea to sea, in nearly the same line where the rampart of Hadrian and the wall of Severus were afterwards erected.

In his third campaign Agricola entered the country of the Caledonians by the head of the Solway, and traversed it as far as the Tay without encountering an enemy. Believing that the invaders would retire on the approach of winter, they abstained from committing any hostilities; but in this expectation they were deceived, for, when winter set in, they found the Romans established in fortified towns, well provided with all necessary stores, and secure alike against surprise or assault. Next year the Roman general built a line of forts between the friths of Forth and Clyde, with the double view of excluding the contagion of revolt, and of protecting the inhabitants of the province against the inroads of the northern barbarians. In his fifth campaign he crossed the frith of Clyde; and, after a variety of skirmishes with the wild natives of Cantyre, Lorn, Argyleshire, and Lochaber, obtained a view of the coast of Ireland, which, from the information he collected as to the force necessary for subduing and retaining, he meditated adding to the Roman empire; but this design was never put in execution. During his sixth campaign he passed the friths of Forth and Tay, and led his army, which was attended and supported in all its movements by a fleet, along the eastern coast of Scotland. The Caledonians hung upon his line of march, and harassed him considerably; but, awed by the presence and sight of the fleet, which was to them a novel spectacle, they generally kept at a respectful distance. In a night attack, however, they threw a portion of his army into confusion; and, having penetrated into the camp of the ninth legion, would have overwhelmed them entirely if Agricola had not come with great celerity to their aid, and driven the assailants back to their woods and morasses. After this action, Agricola retired into winter quarters, and left the Caledonians a short respite to prepare for the final struggle in defence of their rude independence.

When the Roman commander took the field in his seventh campaign, he found the native host encamped in a position the exact locality of which has been much disputed (some fixing it at the base of the central and others at that of the eastern portion of the Grampian chain), under a chief whose name has been latinized into Galgæus. The barbarians were estimated at near 30,000 men, whilst the Roman army was little, if at all, inferior in number. But every possible advantage was on the side of the latter; for with what conceivable chance of success could a disorderly mass or rabble of 30,000 barbarians contend against an equal number of highly-disciplined and veteran troops, led on by a general of consummate ability and great experience in the art of war? The elaborate description of Tacitus has caused an importance to be attached to this battle, which, in reality, does not belong to it. The issue was never even for an instant doubtful. The Caledonians were defeated with great slaughter, ten thousand having fallen either in the battle or in the pursuit, whilst the loss of the Romans scarcely exceeded three hundred men. After the defeat of their main body, a reserve of the Caledonians moved to take the Romans in flank; but the attempt was defeated by Agricola in person at the head of a strong body of legionaries, and the flight then became universal. The inhabitants mingled with the fugitives after setting fire to their dwellings, and the silence of de-

solation succeeded to the noise of conflict. The pursuit was soon discontinued; the vanquished found refuge in their mountain fastnesses; and as the Grampian range which towered in front constituted the advanced bulwark of a country wholly unknown, Agricola did not attempt to penetrate into its dangerous defiles, but, marching into the country now called Angus, took it from the Horesti, whom he had previously subdued. Meanwhile his fleet returned from a voyage of discovery which it had prosecuted as far as the Orkades, and even Thule, supposed to be Foula, the most northerly of the Zetland islands; and Agricola established his winter quarters on the most level district, which lay to the northward of the natural frontier formed by the two friths. But in the reign of Domitian it was difficult for the most prudent general to be long successful with safety. Agricola was recalled; and, on his return to Rome, all the arts by which he shunned popularity proved insufficient to lull the suspicions of a jealous tyrant, by whose directions his days seem to have been shortened by poison.

Under Agricola the Roman dominion reached its utmost extent in Britain, and the natives, as we have seen, were driven into the rugged and inhospitable regions beyond the Grampians. From this time till the close of the third century the island is seldom noticed by the Roman historians. We know, indeed, though chiefly by the evidence of medals, that the mountaineers broke into the Roman province, and were driven back into their fastnesses by the vigorous arm of Hadrian, who erected a second wall, the remains of which are still traceable from the Solway Frith to the mouth of the Tyne. Under Antoninus the same species of fortification was constructed on the more northern frontier of the friths; while Severus, abandoning Agricola's rampart, which Antoninus had caused to be repaired, erected a stone wall almost parallel with that of Hadrian already mentioned, and in a manner equally solid and durable. These frontier works, executed on so large a scale, and requiring a numerous body of troops at the different stations for their defence, sufficiently attest the persevering and formidable character of the assaults of our rude ancestors on the Roman power in Britain. They might be beaten, but they could not be subdued; they might be driven back, but in a little time they were sure to return to the attack. The progress of the Roman arms in the reduction of Britain was singularly slow; and, notwithstanding all their defensive precautions, the tenure by which the northern part of the province was held seems to have been exceedingly insecure. Gaul was conquered by one great effort, and retained in subjection without difficulty. Britain, on the other hand, though peopled by a race of kindred origin, was only carried as it were foot by foot, and kept under by the direct ascendancy of military power. And this difference produced another, which, in its results, often influenced the destinies of the Roman world. Its insular situation, and the large force which it was necessary to maintain for the support of order and government, offered irresistible temptations to irregular ambition; it became "an island fertile in usurpers;" and the commander who assumed the purple had always at hand powerful means to enforce his pretensions. It was alike the object and the theatre of all manner of intrigues and contentions; the first, though not the highest, prize in the lottery of ambition. Hence the Roman cultivation was extended to it in a much less degree than to Spain and Gaul. The writers of the latter province were respectable, those of the former the most celebrated of the time; but Roman Britain did not produce a single literary name. In what degree the prevalence of the Latin might have paved the way for that disappearance of the ancient language of Britain in the lar-

Period.

British and Roman Period.

ger and more fertile portion of the island, which was completed under the Saxons, there are no memorials extant which warrant us to hazard a conjecture. The Roman remains seem rather to indicate the luxury of the military stations of that people, than a desire to adorn their province with civil architecture; whilst, in the convenience and magnificence of their roads, they only contemplated the security of their power or the extension of their conquests.

The precise period of the introduction of Christianity into Britain is uncertain. About the end of the second century, however, we find Tertullian boasting that the gospel had subdued tribes yet unconquered by the Romans; and from this circumstance, as well as from our more accurate information respecting the diffusion of Christianity in Gaul, it may be reasonably supposed that its first planting in our island was considerably earlier. Two centuries afterwards, theological controversy had become so prevalent, that Pelagius and Celestius, the one a Welchman and the other a Scotchman, agitated all Christendom by their heretical notions on the subjects of original sin and free will. The received opinion, which ascribes to Constantine, who began his reign at York, the introduction of Christianity into Britain towards the middle of the fourth century, is founded upon the palpable error of confounding the first preaching of the gospel with the formal recognition or establishment of Christianity, upon the ruins of Paganism, as the religion of the empire. Long before that time intrepid and dauntless missionaries had carried the faith of the cross to the hearths and the homes of our barbarous ancestors; and the policy of Constantine only kept pace with, instead of outrunning, the natural course of events.

When Severus died at York, Caracalla, then known by his original name of Bassianus, concluded a peace with the Caledonians, and, along with his brother Geta, hastened to Rome to plunge into all the debaucheries of the capital. There now occurs in the history of Britain a chasm of seventy years, during which the silence of the Roman writers would lead us to infer that the island enjoyed peace. In the reign of Diocletian, Carnusius, intrusted with the command of a naval armament, fitted out to repress piracy on the coasts of Britain, usurped the purple, and maintained his assumed dignity for eight years. But while Constantius, the coadjutor of the emperor, was preparing to attack him, he was assassinated by Allectus, who, imitating the example of his master, usurped the sovereignty, and maintained it for three years. He was, however, defeated and slain by Constantius, who put an end to the rebellion, and dispersed the followers of the usurper. In the division of the empire between Galerius and Constantius, Britain fell to the share of the latter, who, in consequence, fixed his residence in the island, and, after some contests with the Caledonians, of which little is known, died at York, leaving his son Constantine his successor in the empire. This prince, not unjustly surnamed the Great, assumed the purple at York, where he staid some time to pay the last honours to his father's ashes, and to finish the war with the Mcætæ and Caledonians, who at this time began to be known by the names of Picts and Scots. Called afterwards to a higher destiny, and recognized as the undisputed master of the Roman world, he overthrew the altars of Paganism, and established Christianity as the religion of the empire, including that portion of it where he had first been invested with the ensigns of the imperial dignity. About eighteen years after the accession of Constantine, Britain took part with the unsuccessful usurper Magnentius. This entailed on it the bitter resentment of Constantius, who sent into the island one Paulus, a Spaniard, with instructions to discover and punish those who had been concerned in the rebellion. Tyranny is not al-

ways so fortunate as so be provided with such instruments. This inquisitor, surnamed Catena, from his expertness in connecting criminal charges, entered at once on his career, and soon filled all the western parts with tortures, confiscations, and murders. Martinus, the British governor, unable to restrain his cruelities, attempted his life, but unhappily missing the aim, was obliged to pay the forfeit of his own. On the accession of Julian to the purple, that event was signalized by an act of exemplary justice; the inhuman Paulus was ordered to be burned alive.

A few words may be necessary here respecting the constitution of the provincial government of Britain. This was generally intrusted to a prefect, who exercised the civil and military power, subject only to the control of the questors, whose peculiar department was finance. The prefect acted as imperial lieutenant or viceroy, and appointed the governors of the six provinces into which Roman Britain was divided. These were, first, Britain to the south of the Severn and the Thames; second, Britain along the Severn, including Wales and the adjoining districts; third, Flavia Cæsariensis, from the two former provinces to the German Ocean, the Humber, and the Don; fourth, Maxima Cæsariensis to the north of the Humber, from its mouth, as far as the mouths of the Tyne and the Eden; fifth, Valencia, from the Tyne to the Clyde and the Forth; and, sixth, Vespasiana, the country beyond the friths, a precarious and ill-defined conquest, continually disturbed by the inroads of the barbarians. Such were the territorial divisions of this country under the Romans. They seem to have been adopted gradually as conquest extended, and afterwards rounded off by natural limits for the convenience alike of the general and of the local government.

For about a century and a half the southern part of the Roman province in Britain had suffered but little disturbance from the northern tribes, whose inroads were generally checked by the frontier defences and garrisons. About ten years, however, after the judicial campaign of Paulus, the Scots and Picts, recovering from the chastisement inflicted on them by the commanders of Julian, attacked with greater force the legions of Valentinian and Valens, and for three years ravaged the province with impunity. They were at length driven back by Theodosius, governor of Britain, and father of the celebrated emperor of that name, who defeated them in several battles, and forcing them beyond the rampart of Agricola, once more extended the province to its utmost ancient limits. But the progressive decline of the empire having exposed its northern frontier to invasion at every point, the Roman troops were gradually withdrawn from this island for the more urgent purpose of protecting the seat of dominion; and about the middle of the fifth century Britain was abandoned to her own resources. Gallio of Ravenna commanded the last detachment of troops that Rome ever sent to this island. This was under Honorius. After repelling a furious inroad of the Scots and Picts, the Roman general, assembling the British chiefs, told them frankly, that, since the empire, labouring under its own weight, could no longer afford them protection, they must henceforth take courage and defend themselves; and, in the name of the emperor, he formally absolved the different cities or townships of the province from their allegiance to Rome. Lastly, having repaired the wall of Severus, erected useful forts, and supplied the natives with military weapons and engines, the Romans took their final departure from Britain exactly four hundred and seventy-five years after Julius Cæsar first landed on its shores.

These bequests, however, proved unavailing. The British youth who had been trained in the Roman army more than once drove back the barbarous tribes of their own

British and Roman Period.

British
and

Period.

island; but the latter increasing in numbers and audacity, at length "broke through their walls, like wolves into a sheep-fold, retired with their booty, and returned every succeeding year." In their distress they made a vain appeal to Ætius, who for a moment propped the falling empire. "The barbarians," said they in a letter entitled the *Groans of the Britons*, "drive us into the sea, and the sea drives us back upon the swords of the barbarians." But Ætius had to do with Attila, and, however much he might pity the suppliants, he could afford them no relief. Disappointed of aid in this quarter, and despairing of their ability any longer to resist their northern invaders, the British states were led to employ in their defence auxiliaries who soon became more formidable than the enemies against whom they had been called in to combat. These mercenaries, who gradually rose to be conquerors, consisted chiefly of Saxons, intermingled with Angles, Jutes, and Frisians from the Cimbric Chersonesus, or peninsula of Jutland. The Saxons, who appear to have had their chief seat on the Elbe, were previously known to the Britons only by predatory descents on their coasts; and, certainly, it does seem rather extraordinary that they should have thought of calling in the aid of such perilous auxiliaries. But, under the pressure of urgent danger or actual calamity, men are more inclined to seek present relief than to calculate remote consequences; and it should be recollected that the Britons, denied all assistance by their former masters, and wholly unable to defend themselves against the desolating inroads of the fierce tribes of the north, were in a situation to close with any scheme which promised even a chance of deliverance. That the invitation given to this marauding race was as formal as it afterwards proved fatal to the native population, may safely be doubted, notwithstanding the direct testimony of the Saxon historians. They were probably at hand, and being always ready to embark in any enterprise which held out a prospect of booty, they in all likelihood required but little solicitation to induce them to join the Britons against their northern enemies. Accordingly, in the middle of the fifth century, the Saxon ships arrived on the British coast, where they disembarked a few hundred wild warriors of that roving nation under their leaders Hengist and Horsa. These fabled descendants of Oden immediately took the field at the head of their followers, and by their aid the Picts and Scots were completely defeated. One evil was thus averted, but another, and, if possible, a greater, succeeded. The Saxons, acquiring a liking for the country they had been hired to defend, and eager to exchange the bleak shores and sandy wastes of the north for the rich fields and more genial climate of Britain, invited fresh bodies of their countrymen to join them, and, in a little time, from being the auxiliaries, they became the conquerors and masters, of the ill-fated Britons. But the latter did not yield without a struggle. Displaying, when it was too late, a valour which, more opportunely exerted, would have spared them the miseries of this contest, they resisted their new tyrants, and occasionally with success. Horsa fell in battle; and so slow was the progress of the Saxon arms, that Hengist, with all his boasted victories, never penetrated beyond the county of Kent. The invaders, however, clung with desperate tenacity to the soil. By degrees the Saxon power reduced the natives to entire submission, or drove them to seek shelter in the mountains of Wales, Cornwall, and Cumberland. Many emigrated to avoid the horrors of this conquest; and some settling in Armorica, the peninsula between the Seine and the Loire, laid the foundation of that singular resemblance in language and manners to the insular Britons which has ever since distinguished the inhabitants of Bretagne. For the history of England from this period until

the union of the crowns, we refer to the article ENGLAND. See also the article SCOTLAND. Reign of James I.

CHAP. II.

REIGN OF JAMES I.

Accession of James to the English throne.—State of the nation at this time.—Origin of the patriotic party.—Grievances of the nation.—James's arbitrary system of government.—Puritans.—Attempt to establish Episcopacy in Scotland.—Iniquity and folly of the project.—First Parliament.—Peace with Spain.—Proposed union with Scotland.—Difference between the King and the Parliament.—New Parliament convoked.—Execution of Sir Walter Raleigh.—Gunpowder Plot.—Policy in regard to Ireland.—Death of Henry Prince of Wales.—Affairs of the Palatinate.—Spanish match proposed.—Remonstrance of the Commons, and dispute consequent thereon.—Marriage with the Infanta resolved on.—Prince Charles sets out for Madrid.—His reception there.—Articles of the Marriage treaty.—Faithlessness of the Prince.—Marriage with the Infanta broken off.—New match proposed with Henrietta of France.—War declared against Spain.—Affairs on the Continent.—Death and character of James.

The history of Britain as one kingdom commences with the union of the crowns in the beginning of the seventeenth century. In 1603 the kingdoms of Scotland and England fell under the dominion of one sovereign, by the accession of James VI. of Scotland to the English throne. He derived his title to the latter from being the great-grandson of Margaret, eldest daughter of Henry VII.; and, on the failure of the male line, his hereditary right remained incontestible. Queen Elizabeth, with her last breath, had recognised him for her successor; and the parliament, conformably to her dying request, had settled the succession on the heirs of Henry VII.; so that few sovereigns ever ascended a throne with more general approbation, or greater hopes of a peaceable and happy reign. The memory of a disputed succession was yet fresh in the minds of the English; and as the title of James was unquestionable, the accession of a protestant sovereign, who was to extinguish the hostility of Scotland, and unite two kingdoms intended by nature to form one, was regarded as a new and auspicious era in the history of both countries.

But the popularity of James hardly survived his arrival in England; the hopes which had been so eagerly cherished were soon blighted; and the history of this monarch's reign consists of little else than a detail of disputes and contentions between him and his parliament. A minute account of these transactions would scarcely conduce either to entertainment or instruction; but it is nevertheless of importance to know their origin, as out of them sprung those succeeding events which make so conspicuous a figure in the annals of Britain.

In the ages which preceded the period upon which we are now entering, the human mind, enervated by superstition, and degraded by ignorance, seemed to have surrendered all pretensions to liberty, either religious or civil. Unlimited and uncontrolled despotism everywhere prevailed; and although England suffered less in this respect than almost any other nation, the numerous examples of arbitrary power exercised by her sovereigns show that the country was then very far indeed from enjoying liberty in any rational sense of the term. As a proof of this, and as an evidence how little restraint was at that time imposed on the authority of the sovereign, it is only necessary to mention, that the proceedings of parliament were accounted of so little consequence, that no journals were kept of them; nor was it till 1607, four years subsequent to the accession of James, that parliamentary journals were commenced, on the motion of Sir Edwin Sandys, a member of great authority in the house.

Reign of James I. The proceedings of parliament being held as of so little consequence, it is no wonder that the sessions were not regular, and that little attention was paid to the choice or continuance of the members. In the reign of Elizabeth and her predecessors the sessions of parliament seldom exceeded in duration a twelfth part of the vacations. When parliaments were prolonged beyond one session, it was usual for the Chancellor to exert a discretionary authority of issuing new writs to supply the place of such members as he judged incapable of attending, either by reason of business, sickness, or any other impediment. No practice could be more dangerous to liberty than this; yet so little were the rights and interests of the nation then understood, that the Commons, of their own accord, confirmed the Chancellor's power in this respect by the 23d of Elizabeth; nor did they proceed any further in the assertion of their privileges, than to vote, that during the sitting of parliament no writ should issue for the choosing or returning of any member without the warrant of the house.

But towards the end of the sixteenth and beginning of the seventeenth century, a great though insensible revolution took place throughout all Europe. Arts and sciences began to flourish; commerce and navigation were greatly extended; and learning of all kinds began to be diffused. More enlarged views naturally gave birth to generous sentiments; a love of freedom, in England especially, was implanted in the breasts of most people of birth and education; and this was greatly promoted by an acquaintance with the ancient Greek and Latin writers. The example of the republics of Greece and Rome, the members of which had so often sacrificed their lives in defence of liberty, produced a powerful impression; and a desire of circumscribing the excessive prerogative and arbitrary proceedings of the crown began to be secretly formed throughout the nation.

Nor was this desire unreasonable, or without a solid foundation. During the last years of Queen Elizabeth's reign, the commerce, navigation, and number of seamen in England, had sensibly decayed. A remonstrance from the Trinity-house in 1602 bears, that since 1588, the number of seamen and shipping had decayed about a third. Every species of domestic industry was fettered by monopolies, and exclusive companies, which are only another species of monopoly; almost all foreign trade, except that to France, was in the hands of a few; and any prospect of future improvement in commerce was for ever sacrificed to the temporary advantage of the sovereign. These companies, though arbitrarily erected, had carried their privileges so far, that almost all the commerce of England centred in London; the customs of that port alone amounted to L.110,000 a year, whilst those of the rest of the kingdom amounted only to L.17,000; and the whole trade of London itself was confined to about two hundred citizens, who, by combining together, were easily enabled to fix whatever price they pleased both on the exports and imports of the nation. Besides this, the subjects were burdened by wardships and purveyances. The latter constituted an old prerogative of the crown, by which the officers of the household were empowered to take, without consent of the owners, provisions for the king's family, and carts and horses for the removal of his baggage, upon paying a stated price for them. The king had also a power of sending any person, without his own consent, on whatsoever message he pleased; and thus he could easily compel an individual to pay any sum of money he chose, rather than be sent out of the country on a disagreeable mission. Money extorted from individuals by this or by any other method was usually called, doubtless in derision, a "benevolence."

These were a few of the grievances under which the

Reign of James I. nation at this time laboured, and which the rising spirit of patriotism tended to redress. This disposition, however, the severe government of Elizabeth had confined within very narrow limits. But when James, a foreign prince, less dreaded and less beloved, succeeded to the throne, symptoms of a freer and more independent genius immediately appeared. Happily, James neither perceived the alteration, nor had sufficient capacity to check its early advances. He had established in his own mind a speculative system of absolute government, which few of his subjects, and none but traitors and rebels, as he thought, would make any scruple to admit. He thought himself entitled to equal prerogatives with other European sovereigns, not considering the military force by which their despotism was sustained. The almost unlimited power which for upwards of a century had been exercised by the English sovereigns, he considered as the prerogative of royal birth, and not as the result of peculiar circumstances skilfully improved. In his person, therefore, he imagined all legal power to be centred by a hereditary and divine right; and so fully was he persuaded of his absolute property in his subjects, that in his speech to the parliament in 1621, he told them that he "wished them to have said that their privileges were derived from the grace and permission of him and his ancestors." And when the same parliament protested that "the liberties, franchises, privileges, and jurisdictions of parliament, are the ancient and undoubted birthright and inheritance of the subjects of England," he was so enraged, that, sending for the journals of the Commons, he, with his own hand, before the council, tore out this protestation, and ordered his reasons to be inserted in the council-book.

The consequence of such opposite dispositions actuating the king and parliament was, that during this reign the prerogatives of the crown were openly and violently attacked. But the chief grounds of discontent were money and religion. The king's high notions of the royal prerogative made him imagine that he had a right to whatever sums he pleased to demand; whilst his profusion caused him to dissipate in a short time the scanty supplies which he succeeded in extorting from the parliament. With regard to religious matters, the nation was at that time greatly infected with Puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, it had been otherwise with the Puritans. So much had they increased by the very means which had diminished the number of Catholics, that no less than seven hundred and fifty clergymen of that persuasion signed a petition to James on his accession to the English throne. They hoped that the king, having received his education in Scotland, and always professed an attachment to the church established there, would at least abate the rigour of the laws enacted against the Puritans, if he did not show them particular favour and encouragement. But in this they were grievously mistaken. He had observed in their Scottish brethren a decided turn towards republicanism, and a zealous attachment to civil liberty. In his capacity of monarch as well as of theologian, he had experienced the little complaisance they were disposed to show him. They controlled his commands; disputed his tenets; and to his face, before the whole people, censured his conduct and behaviour. This superiority assumed by the Presbyterian clergy, the monarchical pride of James could never digest. Although he had been obliged, while in Scotland, to court their favour, he treasured up, on that account, the stronger resentment against them; and he was determined to make them feel, in their turn, the full weight of his authority. He therefore not only rejected the petition of the clergymen above mentioned, but throughout his whole reign refused to relax in the least the severity of the laws against

Reign of
James I.

Protestant nonconformists, although often petitioned to the contrary by his parliament.

The same principles which produced in James such an aversion to the Puritans, prompted him to favour the Episcopalians, and even the Catholics, as being greater friends to despotism. In his youth he had been suspected of a bias towards the ancient religion; and it is certain that when he ascended the throne of England, he often endeavoured to procure some mitigation of the laws against them, if not an absolute toleration. But in this he was constantly opposed by the parliament; and indeed the strong inclination shown by James to establish Episcopacy throughout the whole of his dominions, tended very much to alienate the minds of his subjects, especially in Scotland, and to create that suspicion of his intentions which accompanied him to the grave.

The first intercourse between King James and his English parliament discovered at once the character of the new monarch, and the spirit of the people over whom he had been called to reign. Vain, pedantic, garrulous, mean, and accessible to flattery, however gross; arbitrary in his principles, and in his own opinion the greatest master of king-craft that ever lived; "the wretched Solomon of Whitehall" found in his English ministers, Cecil, Suffolk, and Northampton, devoted parasites and ready tools. His address to the parliament bespoke his own opinion of himself, and showed that he believed himself an absolute king, whose proclamations were to have the force of laws. But it was only with his courtiers and bishops that James passed for that paragon of wisdom and policy which he devoutly believed himself to be. The House of Commons already contained many men of free, fearless, and intelligent minds; nor were the principles of independence, which in several instances had been asserted against all the power and energy of Elizabeth, likely to be veiled before the mock dignity of such a regal punchinello as James. His first parliament, accordingly, reminded him of their privileges; resisted the arbitrary issue, by the Chancellor, of new writs for elections; and made some laudable attempts to check the spirit of monopoly which paralysed the trade and manufactures of the kingdom, as well as to relieve the landed interest from some remnants of feudal oppression.

The accession of James was speedily followed by the conclusion of peace with Spain. The tendency of his disposition was pacific, not so much from principle, as from the want of all energy, vigour, and force of character, if not positive cowardice. But whilst the nation was thus delivered from the evils of war, a deadly blow was meditated against the government in all its branches, and against the religion of the country. This was the famous Gunpowder Plot, which the habitual fears of the king, sharpened by the scenes he had witnessed in his youth, enabled him to "nose out," as he called it, and to read the true meaning of the threats contained in a letter from one of the conspirators, after it had eluded the sagacity of his wisest counsellors. The common danger which the king and the parliament had escaped kept them for a time in good humour with each other; and a supply of £400,000 was voted by the Commons to relieve the king from the embarrassments in which his thoughtless profusion had involved him, and to enable him to give a suitable reception to his brother-in-law, the king of Denmark.

But the most important subject of discussion which occupied the attention of this first parliament was a project for incorporating the kingdoms whose crowns were already united on the head of James. A motion to this effect was made by Sir Francis Bacon, the king's solicitor, who supported it with all the ability, ingenuity, and eloquence for which he was so greatly distinguished; maintain-

ing that, for the object contemplated, there was no need of uniformity in the laws or religion of the two countries,—and that, with Ireland subdued, Scotland united, and the navy duly supported, the English monarchy would become the most formidable in the world. It is to the honour of James, and reflects credit on the sagacity which he at intervals displayed, that he was eager in forwarding this measure. But the Commons remained inflexible, and the project consequently failed. In conformity, however, with an opinion obtained from the judges, the *post-nati*, that is, all Britons born since the death of Queen Elizabeth, were declared to be naturalized subjects in either kingdom.

Pecuniary difficulties, from which the king was never free, brought him again as a suppliant for aid from this parliament. Squandering with reckless prodigality, he was continually in want; and, in the present instance, his embarrassments were aggravated by the expense incurred in maintaining his government in Ireland. The parliament acceded to his solicitations; but, in return, demanded a redress of grievances, and amongst these the suppression of the High Commission Court, which had become odious by the severities it exercised against the Puritans. James refused the supply tendered on such conditions, and the dispute ended by his dissolving the parliament; on which occasion the royal pedant told them "not to meddle with the main points of government—that was his craft; nor pretend to instruct a king who had been thirty years at the trade in Scotland, besides an apprenticeship of seven years in England."

But James found it impossible to dispense altogether with this "meddling" body. His usual extravagance soon reduced him to straits, notwithstanding the discreditable shifts he had recourse to for raising money; and, in 1613, he was obliged to convoke another parliament, for the sake of obtaining a supply. At this time Robert Carre, whom he had raised through several gradations of dignity to be Earl of Somerset, engrossed the favour of the monarch, and merited the hatred of the nation. The sums spent on this worthless minion, and the countenance shown him after the murder of Sir Thomas Overbury, at once degraded the king in the eyes of the people, and drained the scanty resources of his ill-supplied exchequer. The consequence was, that his second parliament proved still more refractory than the first. On their assembling, the king proposed to them to vote a supply, and then proceed to the consideration of such grievances as required to be redressed. But the Commons inverted this order of procedure, and began with the redress of grievances. The king's wrath was kindled at their obstinacy. He dismissed them, and imprisoned some of the members who had particularly signalized themselves in resisting the supply; a proceeding of fatal example, as the son and successor of James afterwards found to his bitter experience, and which Lord Coke justly describes as the greatest violence ever done to the constitution by an English monarch.

In 1617 the king revisited Scotland, with the design of establishing Episcopacy in that kingdom. He did not, however, propose to abolish Presbytery entirely, and set up Episcopacy in its room. He meant to content himself with establishing the royal authority above the ecclesiastical, and introducing some ceremonies into the public worship, such as kneeling at the sacrament, private communion, private baptism, confirmation of children, the observance of Christmas, and the like. But as his design was fully seen through from the beginning, every advance towards Episcopacy produced the greatest discontent, and the ceremonies in question were rejected as so many mortal sins.

Reign of
James I.

At this time the power of the Scotch clergy was exceedingly great; and the severe spirit with which they were actuated prompted them to exercise it in a manner little calculated to operate in the way of conciliation. Every ecclesiastical court possessed the power of excommunication, which was then attended with serious temporal effects, to say nothing of the spiritual consequences which were supposed to flow from it. The person excommunicated was shunned by every one as profane and impious; and his whole estate during his life-time, with all his movables for ever, were forfeited to the crown. A sentence of excommunication might be pronounced in a summary manner, even by an inferior ecclesiastical court, against a person, whether he lived within the bounds of their jurisdiction or not; and as its effects were in every instance the same, the power which the clergy thus exercised was truly formidable. But they were not satisfied with this unbounded authority in ecclesiastical matters; they assumed a censorial power over every part of the administration; and, mingling politics with religion in their sermons, and even in their prayers, they inculcated principles which were accounted alike turbulent and seditious. But however much we may revolt at this intermixture of sacred and secular things, there was something in the spirit and circumstances of the time which went far to justify it. The pulpit was then the only place whence the people could derive instruction, and their sole teachers and guides were the clergy. No public press as yet existed. Books were few and expensive, appearing at distant intervals, and wholly inaccessible to the mass of the people. Journals were wholly unknown. In such circumstances the clergy naturally became the political as well as the religious instructors of the people; the defenders of their civil rights as well as the guardians of public morals, and of the purity of ecclesiastical discipline.

That a monarch like James should have hated an order of men whom he could neither intimidate by his power nor cajole by his flatteries, is most natural. But this forms a poor justification for the faithless and hypocritical course he pursued; whilst his maxim of "No bishop, no king," shows that his understanding was as confined as his character was mean and grovelling. He began his attack upon Presbytery by discontinuing the General Assembly, and banishing those clergymen who had the spirit to remonstrate. He procured a decree restoring thirteen bishoprics; and, at a packed meeting of the subservient part of the Scottish clergy, the holders of these unenviable preferments were appointed perpetual moderators within their presbyteries. And to complete the degradation of the people, a high commission was given to the prelates, conferring upon them inquisitorial and discretionary powers of citing and punishing for religious opinions, laymen as well as clergymen. But this tyrannical and iniquitous project utterly failed. James aimed at nothing less than subverting the established religion of the country, and he was unable to introduce a single ceremony borrowed from Episcopacy. Not a rag of the surplice would the stern Presbyterians of that age consent to tolerate. Enough, however, was done to envenom the hatred of the people, and to treasure up vengeance against the coming day of retribution. James, it has been truly said, was one of those kings whom God seems to send for the express purpose of hastening revolutions.

Nor was he in any degree more successful in the opposition which he attempted to the puritanical innovations in England. He had observed, in his progress through that kingdom, that a rigid, or, as some called it, Judaical observance of the Sabbath gained ground every day; and that by this means the people were debarred from such sports and recreations as contributed to their health as well as amuse-

ment. Imagining that it would be easy to infuse cheerfulness into the spirit of devotion which then prevailed, he issued a proclamation to allow and encourage, after divine service, all kinds of lawful games and exercises. But this proclamation was regarded by his subjects as an instance of the utmost profaneness and impiety. In 1620 a bill was brought in by the Commons for the more strict observance of the Sunday, which they called the Sabbath. One Shepherd opposed this bill, objecting to the appellation of Sabbath, as puritanical, and justifying indulgence in sports and amusements on that day. For this he was expelled the house on the motion of Mr Pym; and in the sentence pronounced against him his offence is described as "great, exorbitant, and unparalleled." The men of that day were in earnest, and seldom did things by halves.

From this sketch, imperfect as it necessarily is, a tolerable idea may be formed of the situation of affairs during the reign of James I., as well as of the character and designs of that weak, wavering, and on the whole mischievous prince. It now becomes our duty to proceed to the more proper business of the present article, and to give some account of the remarkable transactions of this period.

The first thing of any consequence was a conspiracy formed, or alleged to have been formed, in the year of the king's accession to the throne, to displace him, and bestow the kingdom on Arabella Stuart, a near relation of his own, and equally descended from Henry VII. Every thing regarding this pretended conspiracy, except that some such plot was favoured by one or two priests, remains nearly in its original obscurity. What renders it remarkable, however, is the concern Sir Walter Raleigh was said to have in it. For this he was tried, condemned without proof, suffered thirteen years' imprisonment in the Tower, and was at length executed out of complaisance to the Spaniards. The execution of this distinguished man is one of the most unjustifiable acts of James's reign. It is certainly possible, as Hume has asserted, that Raleigh may have made the pretended gold mine in Guiana a cloak for his real design of plundering the Spanish settlements; but if the fact admitted of as easy proof as has been alleged, Raleigh ought to have been punished on that account, and on no other. It has been conceded, however, that an English jury would not have returned a verdict of guilty against him; and if so, the sacrifice of the bravest living commander, at the instigation of a foreign power, was equally detestable in itself and derogatory to the dignity and independence of the country.

Allusion having been already made to the Gunpowder treason, discovered in 1605, the origin and circumstances of that desperate plot shall now be detailed. On the accession of James, great expectations had been formed by the Catholics that he would prove favourable to them; and it is even pretended that he had entered into a positive engagement to grant them toleration as soon as he should mount the throne of England. But their hopes were built on an insecure foundation. James on all occasions expressed his intention of executing strictly the laws enacted against them, and of persevering in the rigorous measures of Queen Elizabeth. A scheme of revenge was first thought of by one Catesby, a man of good parts and ancient family, who communicated his design to Percy, a descendant of the house of Northumberland. The latter proposed to assassinate the king. But Catesby deemed this quite inadequate to the purpose, inasmuch as the king would be succeeded by his children, who would also inherit his maxims of government; and even if the whole royal family were destroyed, the parliament, nobility, and gentry, who were all infected with the same heresy, would raise another Protestant prince to the throne. "To serve any good purpose," said he, "we must destroy, at

Reign of
James I.

Reign of
James I.

one blow, the king, the royal family, the lords and commons, and bury all our enemies in one common ruin. Happily they are all assembled on the first meeting of parliament, and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us may run a mine below the hall in which they meet; and choosing the very moment when the king harangues both the houses, consign over to destruction the determined foes to all piety and religion."

This comprehensive scheme being approved of, it was resolved to communicate it to a few more. Thomas Winter was sent over to Flanders in quest of Fawkes, an officer in the Spanish service, of approved zeal and courage. All the conspirators were bound by the most solemn oaths, accompanied with the sacrament; and to such a degree had superstition hardened their minds, that not one of them entertained the smallest compunction for the cruel destruction they were preparing to commit. Some indeed were startled at the thoughts of destroying a number of Catholics who must necessarily be present as spectators, or attendants on the king, or as having seats in the House of Peers; but Desmond a Jesuit, and Garnet, superior of that order in England, removed these scruples, by showing that the interest of religion required in this case the sacrifice of the innocent with the guilty.

This happened in the spring and summer of 1604, about which time the conspirators hired a house in Percy's name, adjoining that in which the parliament was to meet. Towards the end of the year they began to pierce through the wall of the house, in order to get in below that where the parliament was to assemble. The wall being about three yards thick, occasioned a great deal of labour; but its density yielded to perseverance, and they at length approached the other side, when they were startled by a noise for which they could not well account. Upon inquiry, they found that it proceeded from a vault below the House of Lords; that a magazine of coals had been kept there; and that the coals were then selling off, after which the vault would be let to the highest bidder. Upon this the vault was immediately hired by Percy, and thirty-six barrels of gunpowder lodged in it; the whole being covered up with faggots and billets, the doors of the cellars boldly flung open, and every body admitted as if it contained nothing dangerous.

Considering themselves as now certain of success, the conspirators began to arrange the remaining part of their enterprise. The king, the queen, and Prince Henry, were expected to be present at the opening of the parliament. But as the duke, by reason of his tender age, would be absent, it was resolved that Percy should seize or murder him. The Princess Elizabeth, likewise a child, being kept at Lord Harrington's house in Warwickshire, some others of the conspirators engaged to assemble their friends on pretence of a hunting match, to seize the person of that princess, and immediately proclaim her queen. The day so long wished for at last approached. The dreadful secret, though communicated to more than twenty persons, had been religiously kept for near a year and a half; and nothing could be foreseen calculated to prevent the success of their design. Ten days before the meeting of parliament, however, Lord Montague, a Catholic, son of Lord Morley, received the following letter, which had been delivered to his servant by an unknown hand.

"My Lord, out of the love I bear to some of your friends, I have a care for your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift off your attendance on this parliament. For God and man have determined to punish the wickedness of this time. And think not slightly of this advertisement; but retire yourself into the country, where you

may expect the event in safety. For though there be no appearance of any stir; yet, I say, they shall receive a terrible blow this parliament, and yet they shall not see who hurts them. This counsel is not to be contemned, because it may do you good, and can do you no harm; for the danger is over as soon as you have burned this letter. And I hope God will give you the grace to make good use of it, to whose holy protection I commend you."

Though Lord Montague imagined this letter to be only a ridiculous artifice to frighten him, he carried it to Lord Salisbury, secretary of state; and the latter laid it before the king on his arrival in town a few days after. His majesty looked upon it in a much more serious light than the young nobleman to whom it had been addressed. From the peculiar manner in which it was expressed, he concluded that some design had been formed to blow up the Parliament House with gunpowder; and it was thought advisable to search the vaults underneath.

The lord chamberlain, to whom this charge belonged, purposely delayed the search till the day before the meeting of parliament. He remarked the great piles of wood and faggots which lay in the vault under the House of Lords; and casting his eye upon Fawkes, who stood in a corner and passed himself for Percy's servant, he could not help noticing the daring and determined courage conspicuous in his face, and which so much distinguished this man even amongst the other conspirators. As Percy lived little in town, so large a quantity of fuel appeared somewhat extraordinary; suspicions were thus excited; and, upon comparing all circumstances, it was resolved to make a further search. About midnight, Sir Thomas Knevet, a justice of peace, was sent with proper attendants; and meeting Fawkes, who had just finished all his preparations, before the door of the vault, Sir Thomas immediately seized him, and, turning over the faggots, discovered the gunpowder. The matches and every thing proper for setting fire to the train were found in the pocket of Fawkes, who seeing now no refuge except in boldness and despair, expressed the utmost regret that he had missed the opportunity of firing the powder at once, and of sweetening his own death by that of his enemies. For several days he displayed the same obstinate intrepidity; but on being shut up in the Tower, and the rack exhibited to him, his resolution at last failed, and he made a full discovery.

Catesby, Percy, and the other conspirators, on learning that Fawkes was arrested, hurried to Warwickshire, where Sir Edward Digby, imagining that his confederates had succeeded, was already in arms to seize the Princess Elizabeth. But she had escaped into Coventry; and they were obliged to put themselves in a posture of defence against the country people, who were raised in all quarters and armed by the sheriffs. The conspirators, with their attendants, never exceeded eighty in number, and being surrounded on every side, could no longer hope either to prevail or escape. Having therefore confessed themselves, and received absolution, they boldly prepared for death, and resolved to sell their lives as dear as possible. But even this miserable consolation was denied them. Some of their powder catching fire, exploded, and disabled them from defending themselves. The people then rushed in upon them. Percy and Catesby were killed by one shot. Digby, Rookwood, Winter, and others, being made prisoners, were tried, confessed their guilt, and died, as well as Garnet, by the hands of the common executioner. The Lords Stourton and Mordaunt, two Catholics, were fined by the Star Chamber, the former in £4000, the latter in £10,000, because their absence from parliament had occasioned a suspicion of their acquaintance with the conspiracy. The Earl of Northumberland was fined in £30,000, and detained several years a prisoner in

Reign of
James I.

Reign of James I. of the Tower, by reason of his having admitted Percy into the number of gentlemen-pensioners without taking the requisite oaths.

James's attempts to civilize the barbarous inhabitants of Ireland, and to render their subjection durable and useful to the crown of England, were more honourable in the design than successful in the execution. He began by abolishing the ancient Irish customs which supplied the place of laws, and were exceedingly barbarous and absurd. By the Brehon law, every crime, however enormous, was punished only by fine. Murder itself was compensated in this way. Every one had a value affixed to him, called his *eric*; and he who was able to pay this, might kill whomsoever he pleased. As for such slight offences as oppression, extortion, or other things of that nature, no penalty was affixed to them, nor could any redress be obtained for them. The custom of *gavelkind*, by which, upon the death of any person, his land was divided amongst all the males of the sept or family, both bastard and legitimate, also operated as a powerful preventive to improvement, and commenced that incessant subdivision of the soil, the bitter consequences of which we have lived to witness. Having abolished these customs, James substituted English law in their stead, and taking the natives under his protection, he declared them free citizens, and proceeded to govern them by a regular administration, military as well as civil. But other measures of a more doubtful character followed. As the Irish had been engaged in rebellion against Elizabeth, a renunciation of all rights formerly granted them to separate jurisdictions was rigorously exacted; a resignation of private estates was even required; and when these were restored, the proprietors received them back under such conditions as seemed calculated to prevent all future oppression of the common people. Meanwhile a company was established in London for planting new colonies in the province of Ulster, which had fallen to the crown by the attainder of rebels. The property was divided into moderate shares, the largest not exceeding 2000 acres; tenants were brought over from England and Scotland; the Irish were removed from the hills and fastnesses, and settled in the open country; husbandry and the arts were taught them; and Ulster, from being the most wild and disorderly province in Ireland, became in time the best cultivated and most civilized.

On the 6th of November this year Henry prince of Wales died suddenly, not without strong suspicions of poison. On opening his body, however, no symptoms of the kind appeared; but his death diffused a universal grief throughout the nation, as he was reckoned a prince of extraordinary accomplishments and high promise. But the marriage of the Princess Elizabeth with Frederic, elector palatine, which was celebrated in February 1613, served to dissipate the grief caused by Prince Henry's death. This marriage, however, proved unfortunate both with respect to the king and to his son-in-law; for the elector, trusting to so great an alliance, engaged in enterprises beyond his means; and James, unable, and perhaps also unwilling, to assist him in his distress, lost his last hold on the affections of his people.

These bad consequences did not begin to appear till the year 1619. At that time the states of Bohemia, having taken arms in defence of the Protestant religion, and persevered in the contest notwithstanding the preparations of the emperor to crush them, made an offer of their crown to the elector palatine, induced doubtless by his connection with the king of England, and his relationship to Prince Maurice, whose authority in the United Provinces was nearly absolute. Stimulated by ambition, the young palatine, without consulting either James or Maurice,

whose opposition he foresaw, accepted the offer, and marched into Bohemia in support of his new subjects. But the affairs of the new king soon came to a crisis. Frederic, defeated in the decisive battle of Prague, fled with his family into Holland; whilst Spinola the Spanish general invaded the palatinate, where, meeting with little resistance, except from one body of 2400 Englishmen commanded by Sir Horace Vere, he quickly reduced the whole principality. The ban of the empire was published against the unfortunate elector in 1621; the upper palatinate was in a little time conquered by the elector of Bavaria, to whom the execution of the decree of the diet had been committed; Frederic was obliged to live with his numerous family in poverty and distress, either in Holland or at Sedan; and the new conquests of the Catholics throughout Germany were attended with persecutions against the Protestants.

By this intelligence the religious zeal of the English was inflamed to the highest pitch. The sufferings of their Protestant brethren in Germany excited universal sympathy, whilst the neutrality and inactivity of James were loudly exclaimed against. But although the king might have defended his pacific measures by plausible arguments, some of his motives were the most ridiculous that can be conceived. In a spirit of pedantic self-conceit, he fancied himself capable of disarming hostile nations by dint of argument; and believed that the power of Austria, though not awed by that of England, would submit to his arbitration merely out of respect to his virtue and moderation. Wedded to his notions concerning the prerogative of kings, he also imagined, that wherever a contention arose between any sovereign and his subjects, the latter must necessarily be in the wrong; and for this reason he from the first denied his son-in-law the title of king of Bohemia, and forbade him to be prayed for in the churches under that appellation. Besides, James was on other accounts extremely averse to a rupture with Spain. He had entertained an opinion peculiar to himself, that any alliance below that of a king was unworthy a prince of Wales; and he never would allow any princess except a daughter of France or of Spain to be mentioned as a match for his son. This pitiful folly gave Spain an opportunity of managing the English monarch in his most important concerns. With a view of engaging him to observe neutrality in regard to the succession of Cleves, the elder daughter of the king of Spain had been indirectly offered during the life of Prince Henry. The bait, however, did not then take; and James, in consequence of his alliance with the Dutch, sent 4000 men to the assistance of the Protestants, by which means the succession was secured to the Protestant line. In 1618, Gondomar offered the king of Spain's second daughter to Prince Charles; and, to render the temptation irresistible to so necessitous a prince as James, he gave hopes of an immense dowry with the Infanta. On this match James built great hopes, not only of relieving his own necessities, but of recovering the palatinate for his son-in-law; at least the public were taught to believe that the recovery of the palatinate was one of the king's chief motives for entertaining the project of such a marriage.

But the Commons viewed the matter in a very different light; and this, joined to other parts of the king's conduct, blew into a flame the contention which had long subsisted between them. On the 14th of November 1621, the Commons framed a remonstrance, which they intended to carry to the king, representing that the enormous growth of the Austrian power threatened the liberties of Europe; that the progress of the Catholic religion in England bred the most melancholy apprehensions; that the indulgence of his majesty towards the professors of that religion had

Reign of James I.

Reign of
James I.

encouraged their insolence and temerity; that the uncontrolled conquests made by the Austrian family in Germany raised mighty expectations in the English Catholics; and particularly that the proposed Spanish match had led them to hope for the entire toleration, if not final re-establishment, of their religion. They therefore entreated his majesty to undertake the defence of the palatinate, and maintain it by force of arms; to turn his sword against Spain, whose armies and treasures were the chief support of the Catholic interest in Europe; to enter into no negotiation for the marriage of his son except with a Protestant princess; to cause the children of Popish recusants to be taken from their parents and committed to the care of Protestant teachers and schoolmasters; and to exact with the utmost severity the fines and confiscations to which the Catholics by law were liable. Protestants had not yet learnt toleration in the school of adversity. The king was then at Newmarket; but hearing of the intended remonstrance, he wrote a letter to the Speaker, sharply rebuking the House for debating on matters far above their reach and capacity, and strictly forbidding them to meddle with any thing that regarded his government, or deep matters of state, and especially not to touch on his son's marriage with the Spanish princess. Upon this the Commons framed a new remonstrance, in which they asserted their right of debating on all matters of government, and claimed entire freedom of speech in their debates. The king replied, that their remonstrance was more like a denunciation of war than an address of dutiful subjects; that their pretension to inquire into all state affairs without exception, was such a plenipotency as none of their ancestors, even during the reign of the weakest princes, had ever pretended to; that they could not better show their wisdom, as well as duty, than by keeping within their proper sphere; and that in any affair which depended on his prerogative, they had no title to interpose with their advice, unless when he pleased to ask it. The Commons in return framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament. Of the leading members of the house, Sir Edward Coke and Sir Robert Phillips were committed to the Tower, and Selden, Pym, and Mallory, to other prisons; while, as a lighter punishment, some others were sent into Ireland to execute the king's commands in that country. A more judicious course was followed with Sir John Saville, who was made comptroller of the household, a privy councillor, and soon after a baron.

This open breach between the king and the parliament soon rendered politics a general subject of discourse; every man began to indulge himself in reasonings and inquiries concerning matters of state; and the parties which arose in parliament were speedily propagated throughout the nation. In vain did James, by reiterated proclamations, forbid discourses of this kind. These, if they had any effect at all, served rather to inflame than allay the curiosity of the public. In every company or society the transactions just mentioned became the subject of argument and debate; some taking the side of monarchy, and others that of liberty. And this was the real origin of the two parties since known by the names of *Whigs* and *Tories*.

During five years James continued the dupe of the court of Spain. Firmly resolved to contract no alliance with a heretic, the king of Spain continued to procrastinate and invent one excuse after another; pretending all along a willingness to conclude the match, though no step had as yet been taken for obtaining a dispensation from the pope. To pave the way for bringing the matter to a close, James issued public orders for discharging all popish recusants who were imprisoned; and it was daily apprehended that

he would prohibit in future the execution of the penal laws against them. This conduct, generous had it proceeded from genuine principles of toleration, he was obliged to justify on the hollow pretence that it was done in order to procure from foreign princes a corresponding indulgence for the Protestants; the severity of the English laws against Catholics having, it was alleged, been urged as a reason against showing any favour to Protestants residing in Catholic kingdoms.

Armed with these concessions, which were but ill relished at home, Digby, earl of Bristol, was sent as ambassador to the court of Spain; and one Gage was secretly dispatched as an agent to Rome. After amusing him so long with false hopes, the court of Spain seemed at last sincere in the projected marriage. Lord Bristol himself, although he had formerly opposed the Spanish match, now came to be of this opinion, and considered the proposed marriage as an infallible prognostic of the palatine's restoration; nor, indeed, was it easy to conjecture why Philip should be ready to bestow the Infanta with a dowry of £600,000 sterling on a prince whose demands he meant to refuse at the hazard of a war, unless we suppose that he reckoned on the cowardice and imbecility of the English monarch's character.

But whilst the king exulted in his pacific counsels, and boasted of his superior sagacity and penetration, all his prospects were blasted by the temerity of the worthless favourite who governed both court and nation with almost unlimited sway. This was Villiers, duke of Buckingham, who had succeeded Somerset in the capricious affections of James, and had risen from the rank of cupbearer to a dukedom and the highest honours of the state. Though possessed of some accomplishments as a courtier, he was utterly devoid of the talent necessary to a minister; and at once partook of the insolence which attends a fortune newly acquired, and the impetuosity which belongs to persons born in high stations, and unacquainted with opposition. Amongst those who had experienced the arrogance of this overgrown favourite, was the Prince of Wales himself; and a coldness, if not enmity, had in consequence arisen between them. Desirous of putting an end to this misunderstanding, and at the same time envious of the great reputation of the Earl of Bristol, Buckingham persuaded the prince to undertake a journey to Madrid. This, he said, considered as an unexpected piece of gallantry, would equal all the fictions of Spanish romance; and, suiting the chivalrous and enterprising character of that nation, would immediately introduce him to the princess under the agreeable character of a devoted and adventurous suitor. Little persuasion was necessary to prevail with Charles to undertake the journey; and the impetuosity of the favourite having extorted a consent from James, the prince and Buckingham (or "Baby Charles" and "Steenie," as the king ridiculously called his son and his minion) set out as knight-errant and squire. They travelled through France in disguise, under the assumed names of Jack and Tom Smith. At a ball in Paris, the prince first saw the Princess Henrietta, whom he afterwards married. She was then in the bloom of youth and beauty, and the novelists of the time say that the prince fell in love with her on this occasion.

On their arrival at Madrid, every body was surprised by a step so little usual among great princes. The Spanish monarch made Charles a visit, expressed the utmost gratitude for the confidence reposed in him, and made warm protestations of a corresponding confidence and friendship. He gave Charles a golden key which opened all his apartments, that the prince might, without any formality, have access to him at all hours; and heaped upon him other marks of distinction and favour if possible still more flat-

Reign of
James I.

Reign of James I. tering. The Infanta, however, was only shown to her lover in public; the Spanish ideas of propriety being too strict to allow any further intercourse till the arrival of the dispensation. Meanwhile no attempt was made by the Spaniards to profit by the circumstance of having the prince of Wales in their power, in order to impose any harder conditions of treaty. Their Catholic zeal, indeed, prompted them on one occasion to seek more concessions in the religious articles; but, on the opposition of Bristol, they immediately desisted. The pope, however, hearing of Charles's arrival in Madrid, tacked some new clauses to the dispensation; and it became necessary to transmit the articles to London for the king's ratification. This treaty, which was made public, consisted of several articles, chiefly regarding the exercise of the Catholic religion by the Infanta; and of these, the only one that could reasonably be found fault with, was that in which the king consented that the children of the marriage should be educated by the princess till they were ten years of age. But besides this public treaty, there were some private articles, which stipulated for a suspension of the penal laws against the English Catholics in the first instance, together with a toleration for the exercise of the Roman Catholic religion in private houses, and, next, a repeal of these laws by parliament. Meanwhile Gregory XV. who had granted the dispensation, died; and Urban VIII. was chosen as his successor. Upon this the nuncio refused to deliver the dispensation till the pleasure of the new pope should be known concerning it. But the crafty pontiff delayed his confirmation, in hopes that, during the prince's residence in Spain, some expedient might be fallen upon to effect his conversion. The king of England, as well as his son, became impatient; but, on the first hint, Charles obtained leave to return, and Philip graced his departure with the same marks of civility and respect which had signalled his arrival.

The modest, reserved, and highly dignified behaviour of Charles, together with the confidence he had reposed in the Spanish nation, and the romantic gallantry he had practised in regard to their princess, endeared him to the whole court of Madrid. But in the same proportion that Charles was beloved and esteemed, Buckingham was despised and hated. His sallies of passion, his indecent freedoms with the prince, his dissolute pleasures, and his arrogant, impetuous temper, which he either could not or would not restrain, rendered him an object of undisguised aversion to the Spaniards. Buckingham, on the other hand, sensible how odious he had become to the Spaniards, and dreading the influence which that nation would naturally acquire after the arrival of the Infanta, employed all his influence to prevent the marriage. What arguments he used to prevail with the prince to offer so gross an insult to the Spanish nation, from whom he had received the most generous treatment, or what colours he employed to disguise the ingratitude and imprudence of such a measure, are totally unknown. Certain it is, however, that when the prince left Madrid, he was firmly determined, in opposition to his most solemn promises, to break off the treaty with Spain. Accordingly, on their arrival at London, the prince and Buckingham assumed the entire direction of the negotiation; and it was not difficult to find pretences under which to mask the breach of treaty which had been secretly resolved on. After employing many fruitless artifices to delay or prevent the espousals, Bristol received positive instructions not to deliver the proxy which had been left in his hands, nor to conclude the marriage until security was given for the full restitution of the palatinate. Philip understood this language; but, determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written

promise, by which he bound himself to procure the restoration of the palatinate either by persuasion or by every other possible means. When he found that this concession gave no satisfaction, he ordered the Infanta to lay aside the title of Princess of Wales, which she had borne after the arrival of the dispensation from Rome, and to drop the study of the English language; and as he foresaw that the rash counsels which now governed the court of England would not stop short at the breach of the marriage-treaty, he immediately ordered preparations for war to be made throughout all his dominions.

A match for Prince Charles was soon afterwards negotiated with Henrietta, daughter of Henry IV., and this met with much better success than that with the Infanta. But the king had not the same inducements to prosecute this match as the former one, the portion promised being much smaller; yet willing that his son should not be altogether disappointed of a bride, and the king of France demanding only the same terms which had been offered to the court of Spain, James thought proper to comply. In an article of this treaty of marriage, it was stipulated that the education of the children till the age of thirteen should belong to the mother; and this probably gave that turn towards popery which afterwards proved the ruin of the unfortunate house of Stuart.

Being now deprived of every other hope of relieving his son-in-law, except by force of arms, James declared war against Spain and the emperor, for the recovery of the palatinate; and six thousand men were sent over into Holland to assist Prince Maurice in his schemes against those powers. The people were everywhere elated at the course which events had taken; and so popular was the idea of a Spanish war, and so great the joy at the rupture of the projected Catholic alliance, that Buckingham became for the time a favourite of the people, and was hailed even by Sir Edward Coke as the saviour of the nation. The reinforcement sent to Prince Maurice was followed by another consisting of twelve thousand men, commanded by Count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views. The troops embarked at Dover found, on arriving at Calais, that no orders had arrived for their admission into that place, much less for affording them a passage through France, as had been promised; and after waiting some time, they were obliged to sail towards Zealand, where proper measures had not as yet been taken for their disembarkation. Meanwhile a pestilential disorder crept in amongst them; half their number died while on board, and the other half, weakened by sickness, was insufficient to march into the palatinate; and thus ended this ill-concerted and fruitless expedition. Whether its unfortunate result had any effect on the king's health is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 27th of March 1625, after having lived fifty-nine years, and reigned over England twenty-two, and over Scotland almost as long as he had lived.

James, the son of Queen Mary and of Lord Darnley, the handsomest couple of their age, was lumpish, not to say deformed, in his person, vulgar in his air, and ungainly in his manners. He had an awkward figure, a rolling eye, a ricketty sidelong walk, nervous tremblings, a slobbering mouth, and a boyishness of manner which formed a ludicrous contrast with the airs of dignity and regal state which he was constantly labouring to assume. These imperfections, it is true, might have been found in the best and greatest man; and it is seldom indeed that nature is equally lavish in physical and mental endowments. But, in this king, the ungainliness of his outward man was not redeemed by intellectual or moral qualities calculated to insure admiration or regard. He possessed

Reign of James I.

Reign of Charles I. some learning, indeed, and, within a narrow circle, exhibited considerable ingenuity of speculation on subjects connected with government and morals. But his understanding was deficient alike in depth and in soundness; his principles were loose, vague, and undefined; his prejudices ridiculously gross; his credulity boundless; and his conceit only to be matched by his pedantry and imbecility. As a king he was perhaps the most extraordinary phenomenon that history has ever presented to the wonder of mankind. What policy would have induced wise tyrants to conceal, James was continually obtruding on all who had the patience to listen to him. His despotic theories of government, and his pretensions to arbitrary power, were continually in his mouth; and whilst he had not a regiment of guards to enforce his doctrines, he talked with more confidence than Hadrian would have judged it wise to assume when at the head of eighty legions and the master of the Roman world. In practice, however, no monarch ever held his prerogatives with less tenacity. "He neither gave way gracefully to the advancing spirit of liberty, nor took vigorous measures to stop it, but retreated before it with ludicrous haste, blustering and insulting as he retreated." Whatever might have been the frailties, vices, or crimes of former kings of England, they had all possessed great force of character, and, whether loved or hated, they had always been feared. James, on the contrary, was only despised; and even his spoiled minion Buckingham made no scruple to laugh outright in the face of his "dear dad and gossip." Nor did the follies and vices of the man tend in any degree to lessen the contempt produced by the feeble and wavering policy of the sovereign. The indecent gallantries of the court, and the habits of gross intoxication which even the females indulged, were viewed with loathing and disgust by a people whose manners were beginning to be tinctured by a more than stoical severity. But there were shades still darker and deeper than these. "Crimes of the most frightful kind had been discovered; others were suspected. The strange story of the Gowries was not forgotten. The ignominious fondness of the king for his minions,—the perjuries, the sorceries, the poisonings, which his chief favourites had planned within the walls of his palace,—the pardon which, in direct violation of his duty and of his word, he had granted to the mysterious threat of a murderer,—made him an object of loathing to many of his subjects."¹ In a word, nature and education seem to have done their best to make James a finished specimen of all that a king ought not to be.

CHAP. III.

REIGN OF CHARLES I.

Accession of Charles I.—His character as contrasted with that of his father.—First Parliament.—Their niggard supply.—Dissolved.—New Parliament.—Impeachment of Buckingham.—Arbitrary proceedings of the King.—Disputes.—Dissolution.—Ship-money.—Forced loan resisted.—Remarkable trial.—War with France.—Buckingham's Expedition.—Third Parliament.

—Petition of Right.—Duplicity of Charles.—Royal assent at length given to the Bill.—Assassination of Buckingham.—Tonnage and poundage.—Parliament dissolved.—Peace concluded with France and Spain.—Archbishop Laud.—Religious Innovations.—New Ministry.—Strafford.—Arbitrary measures of the King.—John Hampden prosecuted for the payment of ship-money.—Particulars of this memorable case.—Hampden, Cromwell, and other Puritans prevented from emigrating to North America.—Attempt to introduce Episcopacy into Scotland.—The Covenant.—King tries to soothe the Covenanters.—Assembly at Glasgow.—Episcopacy abolished.—War.—Peace.—War again declared.—A Parliament called and dissolved.—Pecuniary distresses of the King.—Royalists defeated at Newburn.—Treaty of Rippon.—Meeting of Parliament.—Impeachment, trial, and execution of Strafford.—Injustice of this proceeding.—Parliament rendered perpetual.—Imprisonment of Laud.—Delinquency.—Charles's visit to Scotland.—His concessions and promotions.—The Incident.—Rebellion and Massacre of the Protestants in Ireland.—Reasons for attaching suspicion to the King.—Proceedings of the English Parliament.—Acrimonious remonstrance of the Commons.—Their violent proceedings.—Roundheads and Cavaliers.—The Bishops retire from the House of Lords.—Impeachment, by the King's order, of six members of Parliament.—He goes in person to seize them.—Consequences of this rash act.—Proffered concessions unavailing.—Commons demand the surrender of the executive power of the state.—Refused by the King.—War between the King and Parliament.

Charles I. succeeded to the same favourite, the same ministers, and the same council, which his father had possessed, to say nothing of the same pecuniary distress; and, unhappily, he also inherited the same principles of government. But in other respects he bore no resemblance to his sire. "He was neither a driveller nor a pedant, a buffoon nor a coward. Even in the judgment of his enemies he was a scholar and a gentleman, a man of exquisite taste in the fine arts, and of strict morals in private life. His talents for business were respectable, and his demeanour was grave, dignified, and kingly. But he was false, imperious, obstinate, narrow-minded, ignorant of the temper of his people, and unobservant of the signs of the times. The main principle of his government was resistance to public opinion; and hence his concessions were delayed till it mattered not whether he resisted or yielded, till the nation, which had long ceased to love or to trust him, had at last ceased also to fear him." (*Edinb. Rev.* vol. liv. p. 515.) At the same time his accession to the throne was greeted with favour, and even hailed as auspicious by the nation, which had been wearied and sickened by the pedantic and presumptuous incapacity of his father. Nothing is more easy than for princes to gain golden opinions; nothing more difficult than to rule with wisdom and moderation in those great crises when the national mind becomes agitated by a new spirit, and when the old frame of government must either accommodate itself to the advancing state of society, or be dashed in pieces by a rude collision with a new and resistless force. Pleased with his temporary popularity, obtained partly by the rupture with Spain, and also in want of money for carrying on his government, Charles resolved to call together the great council of the nation; and, accordingly,

¹ *Edinburgh Review*, vol. liv. p. 512. "The sovereign whom James most resembled," says the very able writer of the article here referred to, "was, we think, Claudius Cæsar. Both had the same feeble and vacillating temper, the same childishness, the same coarseness, the same poltroonery. Both were men of learning; both wrote and spoke—not, indeed, well, but still in a manner in which it seems almost incredible that men so foolish should have written or spoken. The follies and indecencies of James are well described in the words which Suetonius uses respecting Claudius:—'Multa talia, etiam privatis deformia, necdum principi, neque infacundo, neque indocto, immo etiam pertinaciter liberalibus, studiis dedito.' The description given by Suetonius, of the manner in which the Roman prince transacted business, exactly suits the Briton. 'In cognoscendo ac decernendo mira varietate animi fuit, modo circumspectus et sagax, modo inconsultus ac præceps, nonnunquam frivolus amentique similis.' Claudius was ruled successively by two bad women; James successively by two bad men. Even the description of the person of Claudius which we find in the ancient memoirs might in many points serve for that of James. 'Ceterum et ingredientem destituebant poplites minus firmi, et remisse quid vel serio agentem multa dehonestabant, risus indecens, via turpior, spumante rictu, præterea linguæ tibubantia?'"

Reign of
Charles I.

he issued writs for summoning a new parliament for the 7th of May 1625. But the arrival of the Princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June, when they assembled at Westminster for the dispatch of business.

The king's discourse to the parliament was full of apparent simplicity and cordiality. He mentioned cursorily the occasion he had for supply, but, it is said, employed no means to influence the suffrages of the members. The officers of the crown, who had seats in the house, were not even allowed to specify the particular sum which he had occasion for; he trusted entirely to the wisdom and affection of his parliament. But the parliament, composed chiefly of Puritans, was not in a humour to be generous, or even just, in appreciating the king's necessities. They knew that all the money formerly granted had been expended on military and naval preparations; that great anticipations were made on the revenues of the crown; that the king was loaded with a debt contracted by his father, who had borrowed money both from foreign princes and from his own subjects; that the public revenues could with difficulty maintain the dignity of the crown, even under the ordinary charges of government; that the present war had been, in a great measure, the result of their own importunate applications and entreaties; and that the nation was solemnly pledged to support their sovereign in carrying it on. They could not be ignorant of the difficulty of military enterprises directed against the whole house of Austria; against the king of Spain, possessed of the greatest riches and most extensive dominions of any prince in Europe; against the Emperor Ferdinand, hitherto the most fortunate monarch of the age, who had astonished Germany by the rapidity of his victories. Yet, with all this knowledge, and to answer all these important ends, the commons thought proper to vote a supply of only £112,000. The excuses which have been made for this insulting parsimony are, the hatred of Buckingham, and the discovery that the war had been produced by his artifices and intrigues. But the validity of this apology may reasonably be disputed. If the war was judged impolitic or unnecessary, it became the duty of the Commons to address the king, praying him to abandon it. If it was neither the one nor the other, they ought not to have avenged themselves for a trifling grievance by insulting the king and degrading the country.

The parliament was adjourned for a few weeks in summer by reason of the plague, which had suddenly broken out; but on their re-assembling at Oxford, the king represented, in the most explicit manner, the necessity there was for a large supply, urging that this request was the first he had ever made them; that he was young, and in the commencement of his reign; and that if he now met with kind and dutiful usage, it would endear to him the use of parliaments, and for ever preserve an entire harmony between him and his people. But the Commons remained inexorable, refusing even the addition of two fifteenths to the former supply. They renewed their complaints against the growth of popery; they demanded a strict execution of the penal laws against the Catholics; they remonstrated against some late pardons granted to priests; and they attacked Montague, one of the king's chaplains, on account of a book he had lately composed, in which it was maintained that virtuous Catholics as well as other Christians would be saved from eternal torments. Charles gave them a complaisant answer, but at the same time firmly resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required. No measure of his whole reign, however, proved more obnoxious to his

Reign of
Charles I.

intolerant subjects, or in its consequences more fatal to himself, than this resolution. The Puritans, who had continued to gain ground during the whole reign of James, now formed the majority of the House of Commons. Petitions were consequently presented to the king for replacing such clergymen as had been silenced for want of conformity to the ceremonies; and laws were enacted for the strict observance of Sunday, which was sanctified with the most rigid and melancholy gloom. The inevitable result of all this was the dismissal of the refractory parliament, which was dissolved on the 12th of August.

During this interval Charles had been obliged to borrow from his subjects on privy-seals and other expedients, by which means he was enabled, though with great difficulty, to equip a fleet destined to act against Spain. But the force thus painfully fitted out performed nothing worthy of notice, and the ill success of the enterprise only served to increase the clamours against the court.

Charles's second parliament, which was speedily convoked, adopted substantially the same views as the first, though without pushing their parsimony to such meanness. They voted a supply of three subsidies, amounting to £168,000 and three fifteenths; but the passing of this vote into a law was reserved until the end of the session; a proceeding which was tantamount to a threat of withholding it unless their demands were satisfied. Charles was greatly incensed at this conduct; but he found it prudent to submit, and to wait the event with patience. In the mean time the Commons attacked the Duke of Buckingham, who had become generally obnoxious; and he was also impeached by the Earl of Bristol in the Lords, on account of his conduct in the Spanish negociation. But the earl's impeachment was entirely overlooked, and the Commons taxed Buckingham with offences, such as administering physic to the late king without consent of his physicians, from which he found little difficulty to exculpate himself. While under this impeachment, Buckingham was elected chancellor of the university of Cambridge, and the king publicly thanked the university for their wise and proper choice. This was keenly resented by the Commons; but when they loudly complained of the affront, the lord-keeper commanded them, in the king's name, not to meddle with his minister and servant, but to finish in a few days the bill they had begun for the subsidies, otherwise they must expect to sit no longer. And to strip this imprudent menace of all disguise, Sir Dudley Carlton emphatically explained it by allusion to those monarchs in Christendom who, owing to the turbulence of their subjects, had been obliged to overthrow parliaments altogether. Nor was this the whole, or even the worst. Adding injury to indignity, the king next ordered two members of the House of Commons, Sir John Eliot and Sir Dudley Digges, the chief managers of the impeachment against the duke, to be thrown into prison, alleging as the reason of this proceeding certain seditious expressions said to have dropped from these members. Upon inquiry, however, it appeared that no such expressions had been uttered; and as the Commons refused to proceed with any business until they received satisfaction in their privileges, the members were accordingly released, though with a very bad grace. Soon after, the House of Lords, moved by the example of the Commons, claimed liberty for the Earl of Arundel, who had been lately confined in the Tower; and after many fruitless evasions the king was obliged, though somewhat ungraciously, to comply with their demand.

The next attack meditated by the Commons, if successful, would have proved decisive, and reduced the king to an absolute dependence on his parliament. They were preparing a remonstrance against the levying of tonnage and poundage without consent of the legislature. This

Reign of
Charles I.

impost, together with six new ones laid on merchandise by King James, constituted nearly one-half of the crown revenues; and it was therefore of vital importance to the king, situated as he was, to preserve it entire, although there can be no doubt whatever that, in its own nature, it was an odious and oppressive tax. It was also the intention of the Commons, if they succeeded in carrying this point, to petition the king to remove Buckingham from his presence and councils. But the king, alarmed at the blow which was preparing for him, anticipated the Commons by dissolving parliament, on the 15th of June 1626. The House of Lords in vain interceded. The king was determined on his course; and when the Peers prayed that the parliament might be allowed to continue its sittings, he replied in anger, "Not a moment longer." The king and the Commons at their separation published each an appeal to the nation.

Charles having thus made a breach with his parliament which there were no hopes of repairing, was obliged to have recourse to the naked exercise of his prerogative in order to supply himself with money. A commission was openly granted to compound with the Catholics, and dispense with the penal laws enacted against them; an expedient by which the king filled his coffers, but gave universal disgust to his subjects. From the nobility he desired assistance; from the city of London he required a loan of £100,000. The former contributed but slowly; the latter, sheltering themselves under many pretences and excuses, gave at last a flat denial. To equip a fleet, an apportionment was made by order of the council amongst all the maritime towns, each of which was required, with the assistance of the adjacent counties, to furnish a certain number of vessels or amount of shipping. The city of London was rated at twenty ships. And this was the first appearance, in the present reign, of ship-money; a taxation which had once been imposed by Elizabeth on a great emergency, but which, revived and carried some steps farther by Charles, produced the most violent discontents. These summary methods of supply, however, were employed with some moderation, until the tidings arrived of the king of Denmark's defeat by Tilly, the imperial general. Money then became more than ever necessary; and as the ways and means hitherto employed had not answered expectation, it was suggested in council, as the most speedy, equal, and effective means of obtaining a supply, to exact a general loan from the subject, rating every man according as he was assessed in the rolls of the last subsidy. The precise sum required was what each would have paid had the vote of four subsidies passed into a law; but it was at the same time ostentatiously declared that the sums thus exacted were not to be considered as subsidies, but as loans.

This paltry and equivocating subterfuge imposed upon no one. It was plain that by the course which the court was now pursuing, the liberty of the subject would be entirely destroyed, and parliaments in future rendered wholly superfluous. It was to no purpose, therefore, that the followers of the court, and their preachers in the pulpit, enjoined submission to this loan as part of the duty of passive obedience and non-resistance. A spirit of opposition arose among the people; many refused these loans; and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By a warrant of the council these were thrown into prison, and most of them patiently submitted to confinement, although such as applied to the king by petition were commonly released. Five gentlemen alone, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Heweningham, and Sir Edmond Hampden, demanded release, not as a favour from the court, but as their

right by the law. No particular cause was assigned for their commitment; the special command of the king and council was alone pleaded. But it was alleged, that, by law, this was not sufficient reason for refusing bail or release to the prisoners. The question was brought to a solemn trial before the Court of King's Bench, and the whole kingdom was attentive to the issue of the cause. By the debates on this subject, it appeared that personal liberty had been secured by no less than six different statutes, and by an article in Magna Charta itself. In times of turbulence and sedition, indeed, the princes had infringed upon these laws; and of this several examples were produced. The difficulty then lay to determine when such violent measures were necessary, and of that the court pretended to be supreme and only judge. As it was found to be legal, however, that the five gentlemen should plead the statute, by which they might demand bail, so it was deemed expedient by the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice; and, as might be expected, satisfied neither party. The court insisted that no bail could be taken; the country exclaimed that the prisoners ought to be set free.

While the king was thus embroiled with his parliament at home, and with powerful nations abroad, he rashly engaged in a war with France, a kingdom with which he had but lately formed an alliance; a temerity bordering on madness. All historians agree that the French, like the Spanish war, was of Buckingham's creating; and the motives which led to it would appear incredible, if the violence, profligacy, and folly of that man's character were not known. At the time when Charles married, by proxy, Henrietta of France, Buckingham had appeared at Paris to grace the festivity, and, by his showy superficial accomplishments, had attracted the admiration of the Queen of France herself. Having conducted Henrietta safely to England, he was preparing, doubtless in the spirit of ambitious gallantry, to return upon a new embassy; when Richelieu, the minister, himself a disappointed lover of the queen, caused a message to be sent him from France, declining the honour of his intended visit. Buckingham's rage at this knew no bounds, and, in a transport of passion, he swore that he would see the queen in spite of all the power of France. He also determined, if possible, to embroil the two kingdoms in war; and with this view he prevailed with Charles to dismiss the queen's French domestics, and encouraged the English ships to seize on those of France. But great as these provocations were, they failed in their object, which was to drive the French to a declaration of war. Upon this Buckingham persuaded the king openly to espouse the cause of the Huguenots, whose leader, the Duke de Soubise, was then in London. And the vain, shallow, impetuous favourite himself set sail with a hundred ships and seven thousand men to assist the Huguenots of Rochelle. Uninformed of his designs, however, the latter shut their gates against him. Instead of attacking the rich and defenceless isle of Oleron, Buckingham then bent his course to that of Rhé; and, after allowing the garrison of St Martyn to be well provisioned, he resolved to reduce it by famine. But his impatience soon led him to abandon this design; and attempting to storm the place without having made a breach in the defences, he was repulsed with the loss of two thirds of his force, and returned to England covered with disgrace. Destitute alike of capacity for war, of common sense and common vigilance, his conduct, throughout the whole of this expedition, was alternately that of an idiot and a madman. He did every thing that he ought not to have done; neglected every thing which it was his duty to do; attempted what was impossible or impracticable; sacrificed

sign of the lives of brave men at the shrine of his insane folly; Charles I. brought disgrace on the national arms; and prodigiously aggravated all the difficulties and embarrassments with which his master was then surrounded. Of all the popinjays ever hatched and feathered in a court, Buckingham was beyond all doubt one of the most mischievous as well as most unprincipled.

Well then might the king and his favourite tremble at the prospect of meeting a third parliament, after having squandered the money illegally extorted from a nation, now on the point of insurrection, on a war begun in the madness of profligacy, and productive only of disaster and shame. But, in the actual state of men's minds, it would have been hazardous to renew the experiment of raising money by the exercise of the prerogative alone. A third parliament was therefore summoned, and met on the 17th of March 1628. At the beginning of the session Charles plainly told them, that "if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which God had put into his hands, in order to save that which the follies of some particular men might otherwise put in danger." Foreseeing that they might expect to be dismissed on the first disagreement with the king, the Commons proceeded with caution, yet relaxed nothing in vigour. The nation was now really suffering from the late arbitrary proceedings. They, therefore, began by remonstrating against arbitrary imprisonments and forced loans; after which, five subsidies, or £280,000, were voted to the king, a sum with which Charles declared himself well satisfied. The Commons, however, resolved not to pass this vote into a law, until they had obtained from the king a sufficient security that their liberties should no longer be violated as they had formerly been. With this view they framed a law which was called a *Petition of Right*, because it was only a confirmation of the ancient constitution, in which they collected all the arbitrary exertions of the prerogative which had taken place since the king's accession, and in particular complained of the grievances of forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They made no pretensions to any unusual power or privileges; nor did they intend to infringe on the royal prerogative in any respect. They aimed only at securing those rights and privileges derived from their ancestors.

But the king, on his part, began plainly to show that he aimed at nothing less than absolute power. This most reasonable petition he did his utmost to evade, by repeated messages to the house, in which he offered his royal word that there should be no more infringements on the liberty of the subject. But these messages had no effect on the Commons. They knew how brittle such promises were without further security, and accordingly passed the bill. In the Lords an attempt was made to stultify the measure, by adding to a general declaration of the rights of property and person a clause to the effect that, in case the sovereign be, from absolute necessity, obliged to imprison a subject, "he shall be petitioned to declare that, within a *convenient time*, he shall and will express the cause of imprisonment, and will, upon cause so expressed, leave the prisoner to be tried by the common law of the land." But in a conference the Commons refused to annihilate their petition by such a compromise; the Lords then passed the bill, and nothing was wanting but the royal assent to give it the force of a law. Charles accordingly came to the House of Peers, sent for the Commons, and being seated in the chair of state, instead of giving the usual concise assent, said, "the king willeth that right be done according to the laws and customs of

the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative." Reign of Charles I.

This equivocal answer was highly resented. The Commons returned in very ill humour; and their indignation would undoubtedly have fallen on the unfortunate Catholics, had not the petition against that persecuted class of religionists already received a satisfactory answer. To give vent to their displeasure, therefore, they fell on Dr Mainwaring, who had preached, and, at the special command of the king, printed, a sermon, which was found to contain doctrines subversive of civil liberty. For these doctrines Mainwaring was sentenced to be imprisoned during the pleasure of the house, to be fined in £1000, to make submission and acknowledgment for his offence, to be suspended for three years, and declared incapable of holding any ecclesiastical dignity or secular office; and his book was ordered to be called in and burnt. But the session was no sooner ended than Mainwaring received a pardon, and was promoted to a living of considerable value; and some years afterwards he was raised to the see of St Asaph. Having dealt thus with Mainwaring, the Commons proceeded to censure Buckingham; and the storm of public indignation seemed ready to burst on his head, when it was diverted by the king's yielding to the importunities of parliament. He went to the House of Peers, and when he pronounced the usual form of words, "*Let it be law as is desired*," the house resounded with acclamations, which were re-echoed over all the country, and the bill for five subsidies immediately passed.

But the Commons were not yet done with the redress of grievances. They called for the abolition of a commission which had been recently granted to thirty-three officers of the crown for levying money by impositions or otherwise, "in which form or circumstance were to be dispensed with rather than the substance be lost or hazarded." They adverted to a scheme for introducing into England a thousand German horse, probably to aid in levying contributions; they again attacked Buckingham, against whom they were justly implacable; and they also asserted that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. To prevent a formal remonstrance on these subjects, the king suddenly prorogued the parliament on the 26th of June 1628.

The hand of an assassin soon rid the Commons of their enemy Buckingham. He was murdered on the 23d of August this same year, by one Felton, who had formerly served under him as a lieutenant. The king did not appear much concerned at his death, but retained an affection for his family throughout his whole lifetime. He desired also that Felton might be tortured, in order to extort from him a discovery of his accomplices; but the judges declared, that though that practice had been formerly very common, it was altogether illegal.

In 1629 the usual contentions between the king and his parliament were renewed. The great article on which the Commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their demands with regard to tonnage and poundage. The question at issue was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not. But the Commons were resolved to support their rights.

They began with summoning before them the officers of

Reign of
Charles I.

the custom-house, to give an account of the authority by which they had seized the goods of those merchants who had refused to pay the duties of tonnage and poundage. The Barons of Exchequer were questioned with regard to their decrees on that head. The sheriff of London was committed to the Tower for his activity in supporting the officers of the custom-house. The goods of Rolles, a merchant, and member of the house, being seized on account of his refusal to pay the duties, complaints were made of this violence, as a breach of privilege. Charles, on the other hand, supported his officers in all these measures; and the breach between him and the Commons became every day wider. Sir John Eliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but the latter refused, and Sir John then read it himself. When the question was called for, the Speaker, Sir John Finch, said, that he had it in command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the Speaker was pushed back, and forcibly held in the chair by Hollis and Valentine, till a short remonstrance was framed, and passed by acclamation. Papists and Arminians were now declared capital enemies to the commonwealth; those who levied tonnage and poundage were branded with the same epithet; and even the merchants who voluntarily paid these duties were declared betrayers of English liberty, and public enemies. The doors being locked, the gentleman-usher of the House of Lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their proceedings; and, on the 10th of March, the parliament was dissolved. Some of the members were imprisoned and fined; but this severity served only to increase the general discontent, and point out the sufferers as proper leaders for the popular party.

Disgusted with parliaments, Charles now resolved to call no more; but finding himself destitute of resources, he was obliged to conclude a war which was begun without necessity, and conducted without glory. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November 1630, by which Charles bound himself to observe a neutrality with regard to the affairs of the Continent. In these treaties the Huguenots and the palatinate were equally abandoned. Charles, however, united with France in mediating between Sweden and Poland, in hopes of gaining the former to the cause of his brother-in-law. But although Gustavus espoused the cause of the German Protestants, and accepted of aid from Charles under the Marquis of Hamilton, he refused, when he had overrun Germany, to restore the palatinate, except on condition of its dependence upon himself. In short, the peace was as ignominious as the war had been disgraceful.

The king's conduct to his subjects cannot now therefore appear blameless, nor the general discontent without foundation. As if resolved to ruin himself utterly, and to forfeit any small degree of regard which his subjects still retained for him, Charles now set about making innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over the king, and, by a superstitious attachment to fantastical ceremonies, led him into a conduct that proved fatal to himself and ruinous to the kingdom. The humour of the nation at that time inclined them to enthusiasm rather than superstition; and the ancient ceremonies which had been sanctified by the permission and practice of the first reformers, were barely tolerated in divine service. Yet Laud chose this time, in every respect the most unseasonable that could have been hit upon, for renewing the ceremonies of the fourth and

fifth century, when the Christian church was sunk in super-
Reign of
Charles I.
stition, and religion had been smothered under a cumbersome mass of unmeaning forms; and so openly were his projects avowed, that not only did the Puritans believe the church of England to be fast relapsing into the ancient faith, but even the court of Rome itself entertained hopes of regaining its former authority in this island, and, in order to quicken the zeal of Laud, twice offered him, in private, a cardinal's hat. He had just sense enough to decline a tender which, if accepted, would have instantly wrought his overthrow. But it must nevertheless be confessed, that if he hesitated openly to declare himself a Catholic, the genius of his religion was essentially identical with that of Rome. The same profound respect was exacted to the sacerdotal character; the same submission to the creeds and decrees of synods and councils; the same pomp and ceremony in worship; the same superstitious regard to days, postures, meats, and vestments. The communion table was removed from the middle of the area where it had hitherto stood in all churches except cathedrals, and placed at the east end, railed in, and denominated an altar, whilst the clergyman who officiated received the appellation of priest. All kinds of ornaments, especially pictures, were introduced; some of them copied from the mass-book. And the crucifix too, that perpetual consolation of all pious Catholics, and terror of all sound Protestants, was not forgotten on this occasion.

In return for the king's indulgence towards the church, Laud and his followers took care to magnify on every occasion the regal authority, and to treat with the utmost disdain all puritanical pretensions to a free and independent constitution. From this subjection, however, they took care to exclude themselves, insisting upon a divine and apostolical charter in preference to a legal and parliamentary one. The sacerdotal character was magnified as sacred and indefeasible; and all right to spiritual authority, or even to private judgment in spiritual subjects, was refused to profane laymen. Ecclesiastical courts were held by bishops in their own name, without any notice being taken of the king's authority; and Charles, though extremely jealous of every claim set up by popular assemblies, seemed rather to encourage than repress the encroachments of his clergy.

Meanwhile the king had changed his counsellors without changing his councils. In order to weaken the popular party, by creating suspicion and distrust of its chiefs, Charles, resorting to an expedient often adopted by princes, had chosen his ministers from the ranks of the patriots, in the hope of converting them into strenuous supporters of the prerogative which he was content to share with them. Nor was he mistaken in calculating the more immediate effects of this political apostacy. Sir Thomas Wentworth, now created Earl of Strafford, was appointed president of the council of York, deputy of Ireland, and chief counsellor of the king. Sir Dudley Digges became master of the rolls; Noy, attorney-general; and Littleton, solicitor-general. But the arch-apostate was Wentworth, a man distinguished by great force of character, dauntless courage, brilliant and commanding eloquence, extraordinary intellectual resources, unconquerable moral energy, and a fierce tumultuous ambition, which led him to trample without scruple or remorse upon every principle accounted most sacred and most binding on public men. In him the popular party lost one of its most powerful supporters, whilst despotism gained a formidable instrument, ready to revenge his own apostacy on the men he had deserted and betrayed, and to employ all his powers for the purpose of crushing those liberties of which he had been the most distinguished champion. This bold, bad man, remarkable alike in every aspect of his character, became the associate and

Reign of Charles I. colleague of Laud, who still retained the chief direction of ecclesiastical affairs, and who has not unaptly been described as a lower kind of Saint Dominic, "differing from the fierce and gloomy enthusiast who founded the Inquisition, as we might imagine the familiar imp of a spiteful witch to differ from the archangel of darkness." (*Edinburgh Review*, vol. liv. p. 521.)

Whilst Charles ruled without parliaments he ruled by the naked exercise of prerogative alone. He wanted money for the support of government; and he levied it, either by the revival of obsolete laws, or by violations of the rights and privileges of the nation. In the Star-chamber and High Commission unheard of severities were practised in order to support the present mode of administration, and suppress the rising spirit of liberty throughout the kingdom. Sir David Foulis was fined £5000 for dissuading a friend from compounding for knighthood. Prynne, a barrister, was condemned to be pilloried in two places, to lose his ears, to pay a fine of £5000, and to be imprisoned during life, for reviling stage plays, huntings, and festivals, and animadverting on the superstitions of Laud. Allison was ordained to pay £1000 to the king, to be publicly flogged, and to stand four times in the pillory, for reporting that the Archbishop of York had fallen into disgrace by asking toleration for the Catholics. Nor were these the only cases of the kind. Personal liberty was annihilated. Meanwhile tonnage and poundage continued to be levied by royal authority alone. The former arbitrary impositions were still exacted, and even new ones laid upon the different kinds of merchandise. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest, and to break any bulk whatsoever, in default of the payment of customs. To exercise the militia, each county was assessed by edict of the council, in a certain sum for maintaining a muster-master appointed to that service. Compositions were openly made with recusants, and the toleration of the Catholic religion being sold, religion became a regular part of the revenue. A commission was also granted for compounding with such as possessed crown-lands on defective titles; and upon this iniquitous pretence large sums were exacted from the people, who chose rather to submit to this fraudulent imposition, than to have the precise nature of their titles and the state of their private affairs exposed to the world.

These arbitrary proceedings led to an occurrence which will be ever memorable in the history of English liberty. John Hampden had been rated at twenty shillings of ship-money for an estate he possessed in Buckinghamshire, which was assessed at a ship of four hundred and fifty tons, or four thousand five hundred pounds. The share of the tax which fell to Hampden was very small; so small, indeed, that the sheriff was blamed for setting so wealthy a man at so low a rate; but although the sum demanded was a trifle, the principle of the demand was essentially despotic. The judges, it is true, had declared that, in case of necessity, the king might impose the tax of ship-money, and that his majesty was the sole judge of that necessity. But after consulting the most eminent constitutional lawyers of the time, Hampden, undismayed by this judicial deliverance, refused to pay the few shillings at which he was assessed, and determined, rather than submit to the imposition, to incur the certain expense and eventual danger of bringing to a solemn hearing this great controversy between the crown and the people. The leading council against the writ was the celebrated Oliver St John, whilst the attorney-general and solicitor-general appeared for the crown. The case was argued during twelve days in the Exchequer Chamber, and the judges took a considerable time for deliberation. No one has ever doubted

that the law was clearly in favour of Hampden, and that the arguments of his counsel remained unanswered. The bench was, however, divided in opinion. Four of the twelve judges pronounced decidedly in his favour; a fifth took a middle course; and the remaining seven gave their voices in favour of the writ. The majority against him was, therefore, the narrowest possible; and when it is recollected that the judges held their situations only during the royal pleasure, and consequently were entirely dependent on the court, this decision may be regarded as in reality a victory. In this light it was considered at the time; and it certainly had the effect of awakening the public indignation against the arbitrary designs of the court, and the abominable prostitution of judicial authority by which these had been sanctioned and abetted. "The judgment," says Clarendon, "proved of more advantage and credit to the gentleman condemned, than to the king's service."

The decision of the Exchequer Chamber, however, had placed at the disposal of the crown the property of every man in England; whilst the abominable proceedings of the Star-chamber, which caused obnoxious individuals to be mutilated and sent to rot in dungeons, showed that the persons as well as the estates of all who ventured to oppose the crown were entirely at its mercy. What that mercy was will immediately be seen. Hampden, with some of his friends and connections, determined to quit England for ever, and to betake themselves across the Atlantic, to a settlement which a few persecuted Puritans had formed in the wilderness of Connecticut. Lords Saye and Brooke were the original projectors of this scheme of emigration; and Hampden, who had been early consulted respecting it, now resolved to withdraw himself beyond the reach of further persecution, having reason to dread the vengeance of the court for the resistance he had offered to its tyranny. He was accompanied by his kinsman Oliver Cromwell; and the cousins took their passage in a vessel which lay in the Thames, bound for North America. They were actually on board, when an order of council appeared, by which the ship was prohibited from sailing; and seven other ships, filled with emigrants, were also stopped by the same authority. "Hampden and Cromwell remained," says the writer from whom we have borrowed so much, "and with them remained the evil genius of the house of Stuart." (*Edinburgh Review*, vol. liv. p. 526.)

While the discontent produced by these arbitrary proceedings was at its height in England, and the people ready to break out in open rebellion, Charles thought proper to attempt setting up Episcopacy in Scotland. The canons for establishing a new ecclesiastical jurisdiction were promulgated in 1635, and were received without any external appearance of opposition, yet with great inward apprehension and discontent. But when the reading of the liturgy was first attempted in the cathedral church of St Giles in Edinburgh in 1637, it produced such a violent tumult that it was not thought safe to repeat the experiment. A universal combination against the religious innovations began immediately to take place; but Charles, as if obstinately bent on his own destruction, continued inflexible in his purpose, though he had nothing to oppose to the united force of the kingdom but a proclamation, in which he pardoned all past offences, and exhorted the people to be more obedient for the future, and to submit peaceably to the use of the liturgy. This proclamation accelerated the insurrection which had before been but slowly advancing. Four Tables, as they were called, were formed in Edinburgh; one consisting of nobility, another of gentry, a third of ministers, and the fourth of burgesses. The table of gentry was divided into many subordinate

Reign of Charles I.

Reign of
Charles I.

ones, according to the different counties. In the hands of the Four Tables the authority of the whole kingdom was placed. Orders were issued by them, and everywhere obeyed with the utmost regularity; and amongst the first acts of their government was the production of the Covenant. This famous instrument consisted of a renunciation of popery, formerly signed by James in his youth, and filled with many virulent invectives against that party. A bond of union or league followed, by which the subscribers obliged themselves to resist all religious innovations, and to defend each other against all opposition whatsoever. The Covenant was subscribed by people of all ranks and conditions. Few disapproved of it in their hearts, and still fewer dared openly to condemn it. The king's ministers and counsellors themselves were mostly of the same way of thinking; and none but persons accounted rebels to God, and traitors to their country, could withdraw themselves from so salutary and pious a combination.

The king now began to be seriously alarmed. He sent the Marquis of Hamilton, as commissioner, with authority to treat with the Covenanters; he required the Covenant to be renounced and recalled; and, as sufficient concessions on his part, he offered to suspend the canons and liturgy till they could be received in a fair and legal way, and so to model the High Commission that it should no longer give offence to his subjects. In answer to this demand, however, the Covenanters declared that they would sooner renounce their baptism than the Covenant; and they invited the commissioner himself to sign it. Hamilton returned to London; made another fruitless journey with new concessions to Edinburgh; returned again to London, and was immediately sent back with still more satisfactory concessions. The king was now willing to abolish entirely the canons, the liturgy, and the High Commission Court; he even resolved to limit greatly the power of the bishops, and seemed content if on any terms he could retain that order in the Church of Scotland. Further, he gave Hamilton authority to summon first an assembly, and then a parliament, where every national grievance should be redressed. But these tardy and reluctant concessions only showed the weakness of the king, and encouraged the malcontents to rise in their demands. The offer, however, of an assembly and a parliament, in which they expected to be entirely masters, was very willingly embraced by the Covenanters.

Perceiving the advantage which his enemies had reaped from their Covenant, Charles resolved to have one on his side also; and he ordered a bond to be drawn up for that purpose. It consisted of the same strenuous renunciation of popery with the other; and although the king did not approve of this, he thought proper to adopt it, in order to remove all the suspicions entertained against him. As the Covenanters, in their bond of mutual defence against all opposition, had been careful not to except the king, Charles also formed a bond, which was annexed to this renunciation, and expressed the subscribers' loyalty and duty to his majesty. But the Covenanters perceiving that this new Covenant was only meant to weaken and divide them, received it with the utmost scorn and detestation; and proceeded without delay to model the assembly from which such great achievements were expected.

This assembly met at Glasgow in 1638. A firm determination had been entered into of utterly abolishing Episcopacy; and, as preparatory thereto, there was laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, as guilty, all of them, of heresy, simony, bribery, perjury, cheating, incest, adultery, fornication, common swearing, drunkenness, gaming, breach of the sabbath, and every other crime which had occurred to the accusers.

The bishops sent a protest, declining the authority of the assembly; the commissioner too protested against that court, as illegally constituted and elected, and in his majesty's name dissolved it. This measure was foreseen, and little regarded. The court still continued to sit and do business. All the acts of assembly since the accession of James to the crown of England were, upon very reasonable grounds, declared null and invalid. The acts of parliament which affected ecclesiastical affairs were on that very account supposed to have no authority. And thus the whole fabric which James and Charles, in a long course of years, had been rearing with much care and policy, fell at once to the ground. The Covenant likewise was ordered to be signed by every one, under pain of excommunication.

In 1639 the Covenanters prepared in earnest for war. The Earl of Argyll, though he long seemed to temporize, at last embraced the Covenant, and became the chief leader of that party. The Earls of Rothes, Cassillis, Montrose, Lothian, the Lords Lindesay, Loudoun, Yester, and Balmerino, also distinguished themselves. Many Scottish officers had acquired reputation in the German wars, particularly under Gustavus; and these were invited over to assist their country in its present necessity. The command was intrusted to Leslie, a soldier of experience and ability. Forces were regularly enlisted and disciplined; arms were commissioned and imported from foreign countries; a few castles which belonged to the king, being unprovided with provisions, ammunition, and garrisons, were soon seized; and the whole country, except a small part under the Marquis of Huntly, who still adhered to the king, fell into the Covenanters' hands, and was soon put in a tolerable state of defence.

Charles, on the other hand, was not deficient in endeavours to oppose this formidable combination. By regular economy he had not only paid all the debts contracted in the French and Spanish wars, but had amassed a sum of £200,000, which he had reserved for any sudden exigency. The queen, who had great interest with the Catholics, both from sympathy of religion, and from the favours and indulgences which she had been able to procure them, now employed her credit in persuading them that it was reasonable to give large contributions, as a mark of their duty to the king, during this urgent necessity; and thus, to the great scandal of the Puritans, a considerable supply was raised. The king's fleet also was formidable and well supplied. Having put five thousand land forces on board, he intrusted the command to the Marquis of Hamilton, who had orders to sail for the Frith of Forth, and cause a diversion by occupying the forces of the malcontents. An army of near twenty thousand foot and three thousand horse was meanwhile levied, and put under the command of the Earl of Arundel, a nobleman of great family, but distinguished for neither military nor political abilities. The Earl of Essex, a man of strict honour, and extremely popular, especially among the soldiery, was appointed lieutenant-general; and the Earl of Holland was made general of the horse. The king himself joined the army, and summoned all the Peers of England to attend him. The whole had the appearance of a splendid court rather than a military armament, and in this state the army arrived at Berwick.

The Scottish force was equally numerous with that of the king, but inferior in cavalry. The officers had more experience; and the soldiers, though ill disciplined and armed, were animated, as well by the national aversion to England, and the dread of becoming a province of their old rival, as by that religious enthusiasm which was the occasion of the war. Yet so prudent were their leaders, that they immediately sent very submissive messages to the

Reign of
Charles I.

Rei of king, and craved leave to be admitted to a treaty. Charles, as usual, took the worst possible course. He concluded a sudden pacification, in which it was stipulated, that he should withdraw his fleet and army; that within forty-eight hours the Scots should dismiss their forces; that the king's forts should be restored to him, his authority acknowledged, and a general assembly and parliament immediately summoned, in order to compose all differences. But this peace was not of long duration. Charles could not prevail on himself to abandon the cause of Episcopacy, and secretly intended to seize every favourable opportunity to recover the ground he had lost. The assembly, on the other hand, proceeded with the utmost vigour and determination. They voted Episcopacy to be unlawful in the church of Scotland; they stigmatized the canons and liturgy as popish; and they denominated the High Commission tyranny. The parliament, which sat after the assembly, advanced pretensions which tended to diminish the civil power of the monarch; and they were proceeding to ratify the acts of assembly, when, by the king's instructions, Traquair, the commissioner, prorogued them. By reason of these claims, which might have easily been foreseen, the war recommenced the same year.

No sooner had Charles concluded the peace, however, than he found himself obliged to disband his army from want of money; and as the soldiers had been held together merely by mercenary views, it was not possible, without great trouble, expense, and loss of time, to re-assemble them. The Covenanters, on the contrary, in dismissing their troops, had been careful to preserve nothing but the appearance of a pacification. The officers had orders to be ready on the first summons; the soldiers were warned not to think the nation secure from an English invasion; and the religious zeal which animated all ranks of men made them immediately fly to their standards as soon as the trumpet of war was sounded by their spiritual and temporal leaders.

In 1640, however, the king managed to draw an army together; but finding himself unable to support them, he was obliged to call a parliament after an intermission of about eleven years. As the sole object of the king in calling this parliament was to obtain a supply, and the only reason they had for attending was to procure a redress of grievances, much harmony could scarcely be expected. The king accordingly insisted for money, and the parliament expatiated on their grievances, till a dissolution ensued; and, as if to render this measure still more unpopular, the king permitted the Convocation to sit after the dissolution;—a practice of which there had been very few examples since the reformation, and which was now deemed exceedingly irregular. Besides granting a supply to the king from the spiritualities, the Convocation, jealous of innovations similar to those which had taken place in Scotland, imposed an oath on the clergy and the graduates in the Universities, binding them to maintain the government of the church, by archbishops, bishops, deans, chapters, and otherwise, as by law established. These steps were deemed illegal, because not ratified by consent of parliament; and the oath became a subject of general ridicule.

Disappointed of parliamentary subsidies, the king was obliged to have recourse to other expedients. The ecclesiastical subsidies offered a considerable resource; and it seemed but just that the clergy should contribute to the expense of a war which they had been mainly instrumental in raising. Charles borrowed money from his ministers and courtiers; and so urgent were his wants, that above £300,000 were subscribed in a few days. Attempts were made to levy a forced loan from the citizens; but these were repelled by the spirit of liberty, which had now become unconquerable. A loan of £40,000 was, however,

extorted from the Spanish merchants who had bullion in the Tower. Coat and conduct money for the soldiery was also levied on the counties; all the pepper was bought up from the East India Company upon trust, and sold at a great discount for ready money; and an infamous scheme was proposed for coining two or three hundred thousand pounds of base money. Such were the extremities to which Charles was now reduced. The fresh difficulties which were every day raised with regard to the payment of ship-money, obliged him to exert continual acts of authority, and augmented extremely the discontents of the people, while his indigence and necessities continued undiminished.

These expedients, however, enabled the king, though with great difficulty, to set in motion an army, consisting of 19,000 foot and 2000 horse. The Earl of Northumberland was appointed general; the Earl of Strafford, who had been recalled from Ireland, lieutenant-general; and Lord Conway general of the horse. A small fleet was thought sufficient to serve the purposes of this expedition. The Scottish forces, though somewhat superior, were sooner ready than the king's army, and marched to the borders of England. But notwithstanding their warlike preparations, the Covenanters still held the most submissive language to the king; having entered England, they said, with no other design than to obtain access to the king's presence, and lay their humble petition at his royal feet. At Newburn-upon-Tyne they were opposed by a detachment of four thousand five hundred men under Conway, who seemed resolved to dispute the passage of the river. The Scots first entreated them civilly not to interrupt them in their march to their gracious sovereign; and then attacking the detachment with great bravery, killed several, and chased the remainder from the ground. A panic now seized the whole English army; the forces at Newcastle fled immediately to Durham; and not thinking themselves safe there, they abandoned the town, and retreated into Yorkshire.

The Scots continuing to advance, dispatched messengers to the king, who had by this time arrived at York. They took care to redouble their expressions of loyalty, duty, and submission to his person; and they even made apologies for their late victory. Charles was in a very distressed condition; and, in order to prevent the further advance of the Scots, he agreed to a treaty, and named sixteen English noblemen to meet with eleven Scottish commissioners at Rippon. Strafford, upon whom, by reason of Northumberland's sickness, the command of the army had devolved, advised Charles rather to put all to the hazard than to submit to the terms which he foresaw would be prescribed. He urged him to push forward, to attack the Scots, and to bring the affair to a quick decision. If he were ever so unsuccessful, nothing worse could befall him than what he would certainly be exposed to from his inactivity; and, to show how easily this project might be executed, he ordered an assault to be made on some quarters of the Scots, and gained some advantage over them. This energetic advice Charles had not resolution to adopt. He resolved to summon a council of the peers; and as he foresaw that they would advise him to call a parliament, he told them in his first speech that he had already taken that resolution. Meanwhile, in order to subsist both armies (for the king was obliged to pay his enemies, in order to save the northern counties), Charles wrote to the city, desiring a loan of £200,000; and the peers assembled at York joined in the same request.

The parliament met in November 1640. The House of Commons had never been observed to be so numerous; and, in order to strike a blow at once against the court, they began with the impeachment of the Earl of Strafford. That nobleman, who was considered as prime minister, both on account of the credit he possessed with his mas-

Reign of Charles I.

Reign of
Charles I.

ter, and his own uncommon vigour and capacity, had incurred the hatred of the three kingdoms. The Scots looked upon him as the capital enemy of their country. He had engaged the parliament of Ireland to advance large subsidies to be employed in a war against them; he had levied an army of nine thousand men, with which he had menaced their western coast; he had obliged those who lived under his government to renounce the solemn league and covenant; and he had governed Ireland, first as deputy, and then as lord-lieutenant, during eight years, with great vigilance, activity, and energy, but with very little popularity, owing to the severities he had exercised. In a nation so averse to the English government and religion, these qualities were sufficient to draw upon him the public hatred. His manners, besides, were at bottom haughty, rigid, and severe; and no sooner did adversity begin to seize him, than this concealed hatred blazed up at once, and the Irish parliament used every expedient to aggravate the charge against him. Nor was this all. The universal discontent which prevailed throughout England was all pointed against the Earl of Strafford; and for this reason, that he was the minister of state whom the king most favoured and trusted. His extraction was honourable, his paternal fortune considerable; yet envy attended his sudden and great elevation, and his former associates in popular counsels, finding that he owed his advancement to the desertion of their cause, denounced him as the arch-apostate of the commonwealth, whom it behoved them to sacrifice as a victim to public justice.

From such causes nothing else could be expected than what really happened. Articles of impeachment were exhibited against Strafford, and this proceeding was followed by a bill of attainder. The king had induced Strafford to leave the army by a promise of protection, and an assurance that not a hair of his head should be hurt; but he soon learnt to his cost, that in neglecting the scriptural admonition, "Put not your faith in princes," he had rushed into the jaws of destruction. It was not without extreme difficulty, however, that the king could be brought to consent to the sacrifice of his favourite minister. He came to the House of Lords, where he expressed his resolution never to employ Strafford again in any public business; but with regard to the treason of which that minister was convicted, he professed himself totally dissatisfied. The Commons, however, voted it a breach of privilege for the king to take notice of any bill depending before the House. Charles did not seem to perceive that his attachment to Strafford was the chief motive for the bill; and that the greater the proof he gave of this attachment to his minister, the more inevitable did he render his destruction. The House of Lords were intimidated, by popular violence, into passing the bill of attainder against the unfortunate earl; and the same battery was next employed to force the king's assent. The populace flocked about Whitehall, and accompanied their demand of justice with loud clamours and open menaces. A thousand reports of conspiracies, insurrections, and invasions, were spread abroad. On whatever side the king cast his eyes he saw no resource nor security. All his servants, consulting their own safety rather than their master's honour, declined interposing with their advice between him and his parliament; the queen, terrified at the appearance of so great a danger, pressed Charles, with tears, to satisfy his people in this demand, which it was hoped would finally content them; Archbishop Juxon alone had the courage to advise him, if he did not approve of the bill, by no means to consent to it. At last, after the most violent anxiety and doubt, Charles granted a commission to four noblemen, in his name, to give the royal assent to the bill; flattering himself, that as neither his will was consenting to the deed,

nor his hand immediately engaged in it, he was free from the guilt which attended this base and ungrateful act.

That Strafford, on general grounds, perhaps, merited his fate, may be more easily conceded than the legality or justice of the proceedings which issued in his condemnation and death. The articles of impeachment exhibited against him respected his conduct as president of the Council of the North, as deputy of Ireland, and as commander-in-chief in England; and four months were employed by the managers in framing the accusation, so as, if possible, to entangle him in the meshes of treason. But he baffled, with wonderful ability, all the arguments of his accusers, whom he met and overthrew on every point; nor was the evidence produced against him at all sufficient to establish the charge of absolute treason, or to warrant the bill of attainder which was subsequently introduced. He was convicted of that constructive or accumulative species of treason, which, once admitted into the criminal jurisprudence of any country, must, in seasons of agitation and excitement, place the life of every man in it at the disposal of the ruling powers. He was sentenced to death in virtue of an *ex post facto* law, and fell the victim of popular odium, if not of party vengeance. It has indeed been said, that the proceedings against Strafford were justified by that which alone justifies capital punishment, or warrants the ravages committed in war, namely, by the public danger. But, even on this ground, it was incumbent on his accusers to show, first, that there was such a pressing and urgent danger as to justify an act of attainder; and, secondly, that the sacrifice demanded was the only mode in which such danger could be obviated or removed. Neither of these points, however, was established, or attempted to be established. The high tribunal before which Strafford was tried, convicted, and condemned, never seems to have thought of setting forth its own fears for the public weal, whether well or ill founded, as the sole and only measure of the justice of its procedure; they went upon grounds totally different, and sought to give a legal sanction to a judgment, for which no better defence can now be devised than the plea of necessity. And had they followed a different course, their conduct would have been at once absurd and inconsistent; for where there is an urgent or admitted necessity, that, from the nature of things, supersedes all ordinary principles of law, all questions of evidence, all considerations of guilt or of innocence; and where, as in this case, a formal investigation and trial have been gone into, it converts them into an absolute and intolerable mockery. The execution of Strafford, therefore, may be more easily palliated than defended. As a revolutionary measure, it may have been expedient; considered as a judicial act, it seems to have been a flagrant violation of the most sacred principles of law and justice.

These commissioners were empowered to give the royal assent to a bill yet more fatal to the king, which provided that the present parliament should not be dissolved, prorogued, or adjourned, without their own consent. By this last bill Charles perpetuated the power which had already become uncontrollable. The reason of this extraordinary step was, that the Commons, from policy rather than necessity, had resorted to the expedient of paying the two armies by borrowing money from the city; and these loans they were to be afterwards repaid by taxes levied on the people. But at last the citizens began to start difficulties with regard to a further loan which was demanded. "We make no scruple of trusting the parliament," said they, "were we certain that the parliament was to continue till our repayment. But, in the present precarious situation of affairs, what security can be given us for our money?" In order to obviate this objection, the above-mentioned bill was sud-

Reign of
Charles I.

Reign of
Charles I.

denly brought in, and having passed both houses with great rapidity, was at last brought to the king, who, being oppressed with grief on account of the unhappy fate of Strafford, did not perceive the effect of it until it was too late.

Soon after the impeachment of Strafford, Laud was accused of high treason, and committed to custody; and to avoid a similar fate Lord Keeper Finch and Secretary Windebank fled, the one into Holland, the other into France. The house then instituted a new species of crime, which was termed *delinquency*; and persons who had acted under the king or by his authority during the late military operations were now called *delinquents*. Many of the nobility and gentry of the nation, while exerting what they considered as the legal powers of magistracy, thus found themselves unexpectedly involved in this new and sufficiently vague offence. The Commons, however, reaped great advantage from their invention;—they disarmed the crown, established the maxims of rigid law and liberty, and spread the terror of their own authority. All the sheriffs who had formerly exacted ship-money, though by the king's express command, were now declared delinquents. The farmers and officers of the customs who had been employed during so many years in levying tonnage, poundage, and other imposts laid on without the authority of parliament, were likewise denominated delinquents, and were afterwards glad to compound for a pardon by paying £150,000. Every sentence of the Star Chamber and High Commission Courts, which from their very nature were arbitrary and oppressive, underwent a severe scrutiny; and all who had concurred in such sentences were voted liable to the penalties of law. No minister of the king, no member of the council, was safe. The judges who had formerly given judgment against Hampden for refusing to pay ship-money were accused before the Peers, and obliged to find security for their appearance when required. Berkeley, a judge of the King's Bench, was seized by order of the house, even when sitting in his court. The sanction of the Lords and Commons, as well as that of the king, was declared necessary for the confirmation of ecclesiastical canons.

In a word, the constitution was new-modelled, in as far as that may be said to have been done by reforming abuses and striking terror into all those who had profited by them, or had in any manner of way been accessory to the arbitrary proceedings of the court. And during the first period of the transactions of this parliament, their merits so greatly overbalanced their defects and errors, as to entitle them to the admiration of all lovers of liberty. Not only were former abuses remedied, and grievances redressed; provision was also made, by excellent laws, against a recurrence of the like evils. And if the means by which they accomplished such great ends savoured often of artifice, sometimes of violence, it is to be considered that revolutions in government cannot always be effected by mere force of argument and reasoning; and that, factions being once excited, men can neither so certainly regulate the tempers of others, nor control their own, as to guard against all excesses.

The king having promised to pay a visit this summer to his subjects in Scotland, in order to settle their government, the English parliament was very importunate with him to lay aside that journey; but they could not prevail with him so much as to delay it. Failing in this, they appointed a small committee of both houses to attend him; in order, as was pretended, to see the articles of pacification executed, but in reality to watch the motions of the king, and to extend still further the ideas of parliamentary authority. This committee consisted of the Earl of Bedford, Lord Howard, Sir Philip Stapleton, Sir William Armyne, Nathaniel Fiennes, and John Hampden.

Reign of
Charles I.

Charles arrived in Scotland on the 14th of August 1641, intending, it is said, to give full satisfaction if possible to the people of that country. And some useful changes were in reality made. The bench of bishops and the lords of articles were abolished; it was provided that no man should be created a Scottish peer who possessed not ten thousand merks, above £500 sterling, of annual rent in the kingdom; a law for triennial parliaments was likewise passed; it was resolved that the last act of every parliament should be to appoint the time and place for holding the parliament next ensuing; and the king was also deprived of the power he had formerly exercised of issuing proclamations which enjoined obedience under the penalty of treason. But the hardest blow given to the royal authority was an article which provided that no member of the privy council, no officer of state, none of the judges, should be appointed without the advice and approbation of parliament. Charles even agreed to deprive of their seats four judges who had adhered to his interests; and their place was supplied by others more agreeable to the ruling party. Several of the Covenanters were also sworn of the privy council; and all the ministers of state, counsellors, and judges, were by law to hold their offices during life or good behaviour. While in Scotland, the king conformed himself to the established church; he bestowed pensions and preferments on Henderson, Gillespie, and other popular preachers; and he practised every artifice to soften, if not to gain, his greatest enemies. The Earl of Argyll was created a Marquis, Lord Loudon an Earl, and Leslie was raised to the peerage by the title of Lord Leven. But though Charles thus heaped favours on his enemies with a prodigal hand, they were not satisfied, believing that all he did proceeded from artifice and necessity; whilst some of his friends were disgusted, and thought themselves ill rewarded for their past services. The king was manifestly playing a part, and he played it ill, because he overacted his assumed character.

Argyll and Hamilton, being seized with an apprehension, real or pretended, that the Earls of Crawford and Cochrane meant to assassinate them, left the parliament suddenly, and retired into the country; but, upon receiving assurances of safety, they returned in a few days. This event, which had no visible result in Scotland, was commonly denominated the Incident; but it was attended with very serious consequences in England. The English parliament immediately took the alarm. They insinuated that the Malignants, as they called the king's party, had laid a plot to murder the godly in both kingdoms; and having applied to Essex, whom the king had left general of the south of England, he ordered a guard to attend them.

In the mean time a rebellion broke out in Ireland, with circumstances of unparalleled atrocity, bloodshed, and devastation. By the judicious conduct of James the old Irish had been subdued, and proper means taken for securing their subjection in time coming; but their ancient animosity still remained, and only wanted an occasion, or rather pretext, to burst forth. And this, according to the received account, was furnished by the circumstances of the times and the weakness of the government.

Roger More, a gentleman descended from an ancient Irish family, but of narrow fortune, first formed the project of expelling the English, and asserting the independence of his native country. He went secretly from chieftain to chieftain, and roused up every latent principle of discontent. He maintained a close correspondence with Lord Macguire and Sir Phelim O'Neale, the most powerful of the old Irish chiefs; and, by his persuasions, soon engaged not only them, but the most considerable persons of the nation, in a conspiracy. It was also hoped

Reign of
Charles I.

that the English of the Pale, as they were called, or the old English planters, who were all Catholics, would afterwards join the party which proposed to restore their religion to its ancient splendour and authority. The design was, that Sir Phelim O'Neale and the other conspirators should begin an insurrection on a given day throughout the provinces, and attack all the English settlements; and that, on the very same day, Lord Macguire and Roger More should surprise the castle of Dublin. They fixed on the beginning of winter for the commencement of the insurrection, that there might be more difficulty in transporting forces from England. Succours of men and supplies of arms were expected from France, in consequence of a promise to that effect made them by Richelieu; and many Irish officers who had served in the Spanish army expressed their readiness to lend their aid as soon as they saw an insurrection commenced by their Catholic brethren. The news which every day arrived from England of the fury expressed by the Commons against Catholics struck terror into the Irish nation, and stimulated the conspirators to execute their fatal purpose, by assuring them of the concurrence of their countrymen.

From the propensity discovered by the Irish to revolt, it was deemed unnecessary as well as dangerous to trust the secret to many; and, though the day appointed drew near, no discovery, it is said, had yet been made by government. The king, indeed, had received information from his ambassadors, that something was in agitation among the Irish in foreign parts; but though he gave warning to the administration in Ireland, his intelligence was entirely neglected. They were awakened from their security only the day before the commencement of hostilities. The castle of Dublin, by which the capital was commanded, contained arms for ten thousand men, with thirty-five pieces of cannon and a proportional quantity of ammunition; yet this important place was guarded by no greater force than fifty men, and even they did their duty negligently. Macguire and More were already in town with a numerous band of retainers; others were expected in the course of the night; and next morning they were to enter on what seemed an easy enterprise, the surprisal of the castle. But O'Connolly, an Irishman and a Protestant, discovered the conspiracy. The justices and council immediately fled to the castle, and reinforced the guards. The city was alarmed, and the Protestants prepared for defence. More escaped, but Macguire was taken; and Mahon, one of the conspirators, being likewise seized, first discovered to the justices the project of a general insurrection.

But though O'Connolly's discovery saved the castle from a surprise, Mahon's confession came too late to prevent the intended insurrection. O'Neale and his confederates had already taken arms in Ulster. The houses, cattle, and goods of the English were first seized. Those who heard of the commotions in their neighbourhood, instead of deserting their habitations, and assembling together for mutual protection, remained at home in hopes of defending their property, and thus fell separately into the hands of their enemies. A universal massacre now commenced, accompanied with circumstances of unequalled barbarity. No age, no sex, no condition, was spared. In the frenzy of this bloody tragedy, every ordinary tie was broken, and death dealt by the hand from which protection was implored and expected. All the tortures which wanton cruelty could devise, all the lingering pains of body, all the anguish of mind, all the agonies of despair, could not satiate revenge excited without injury, and cruelty derived from no cause. Enormities, indeed, were committed, which, though attested by undoubted evidence, appear almost incredible. The stately buildings or commodious habitations of the planters, as if upbraiding the sloth and igno-

rance of the natives, were consumed with fire, or laid level with the ground; whilst the miserable owners, shut up in their houses, and preparing for defence, perished in the flames, together with their wives and children; thus affording a double triumph to their insulting foes. If anywhere a number assembled together, and resolved to oppose the assassins, they were disarmed by capitulations and promises of safety, confirmed by the most solemn oaths; but no sooner had they surrendered, than the rebels, with perfidy equal to their cruelty, made them share the fate of their unhappy countrymen. Others tempted their prisoners, by the love of life, to embroil their hands in the blood of friends, brothers, or parents; and having thus rendered them accomplices in their own guilt, gave them that death which they sought to shun by deserving it.

The barbarities by which Sir Phelim O'Neale and the Irish in Ulster signalized their rebellion may be imagined from this faint description. More, shocked at the recital of such enormities, flew to O'Neale's camp; but he found that his authority, though sufficient to excite the Irish to a rebellion, was too feeble to restrain their inhumanity. Soon afterwards he abandoned the cause, and retired to Flanders. From Ulster the flames of rebellion diffused themselves in an instant over the other three provinces of Ireland. In all places death and slaughter were common, though the Irish in some provinces pretended to act with moderation and humanity. But barbarous indeed was their humanity. Not content with expelling the English from their houses, they stripped them of their very clothes, and turned them out naked and defenceless to all the severities of the season; and the heavens, as if conspiring with the wrath of man against that unhappy people, were armed with cold and tempest unusual to the climate, and destroyed what the sword had spared. By some computations, the number of those who perished by all these cruelties is estimated at a hundred and fifty thousand; by the most moderate, forty thousand are calculated to have lost their lives; but even this estimate is in all probability exaggerated.

The English of the Pale, who were not probably at first in the secret, pretended to condemn the insurrection, and to detest the barbarity with which it was accompanied; and by their earnest protestations they engaged the justices to supply them with arms, which they promised to employ in defence of government. But the interests of religion were found to have more influence over them than a regard to duty and the peace of their country. They chose Lord Gormonstone as their leader; and, joining the old Irish, rivalled them in acts of cruelty towards the English Protestants. Besides many smaller bodies dispersed over the kingdom, the main army of the rebels amounted to twenty thousand men, and threatened Dublin with an immediate siege. Both the English and Irish rebels pretended authority from the king and queen, but especially the latter, for their insurrection; and they affirmed that the cause of their taking arms was to vindicate the royal prerogative, now invaded by the puritanical parliament. Sir Phelim O'Neale having, it is said, found a royal patent in the house of Lord Caulfield, whom he had murdered, tore off the seal, and affixed it to a commission which he had previously forged for himself.

The king received intelligence of this insurrection while in Scotland, and immediately communicated the disastrous tidings to the Scottish parliament; expressing a hope that, as there had all along been an outcry against popery, the nation would now, when that religion was appearing in its blackest colours, support him vigorously in the suppression of it. But if he was sincere in this request, which may not uncharitably be doubted, the Scots were not dis-

Reign of
Charles I.

posed to give so serious a pledge without due deliberation. Considering themselves now as secured in the enjoyment of their rights, and conceiving hopes from the present distresses of Ireland, they resolved to ascertain precisely the ground on which succours were demanded, before consenting to grant them. Except dispatching a small body of forces to support the Scottish colonies in Ulster, the utmost length they would go, therefore, was to agree to send commissioners to London, in order to treat with the parliament. The king accordingly found himself obliged to have recourse to the English parliament, and to depend on their assistance for a supply. He told them that the insurrection was not, in his opinion, the result of any rash enterprise, but of a preconcerted conspiracy against the crown of England. To their care and wisdom, therefore, he said, he committed the conduct and prosecution of the war, which, in a cause so important to national and religious interests, must of necessity be immediately begun and vigorously pursued. These words are fair-seeming, and it would be cruel to load the memory of an unfortunate prince with unjust reproach, or even ill-founded suspicion. But the impartiality of history compels us reluctantly to admit that there are grounds for charging the king with a guilty foreknowledge of what was designed and perpetrated in Ireland. The suddenness of his visit to Scotland, and the time chosen for undertaking it; his whole conduct in that country, particularly in at once making concessions at utter variance with the principles of his government and the integrity of his prerogative, which he had risked a civil war to preserve entire, and in heaping favours on his bitterest enemies; his new-born zeal against popery, which he had been so long covertly labouring to introduce; the criminal intrigues of the queen and those about her person, of which he could scarcely be altogether ignorant; the known deceit and duplicity of his own character; the strange inaction of the public functionaries in Ireland, even after they were apprized of the danger, to say nothing of the deaf ear they had turned to many previous hints that danger was brewing, and some sudden explosion contemplated; the absence of all proof of the fraud alleged to have been committed by O'Neale in regard to the royal patent said to have been found in the house of Lord Caulfield;—these, and many other circumstances that might be mentioned, seem to establish, first, that Charles had some very particular and urgent reasons for visiting Scotland at this time; secondly, that while there he acted a part which is only explicable on the supposition that he had a secret design to cover by it; thirdly, that such an impression seems to have been general at the time; and, lastly, that there are circumstances connected with this atrocious rebellion which have never been explained in such a manner as to vindicate the king's memory from the suspicion of at least guilty knowledge.

The English parliament, now re-assembled, discovered in each vote the same dispositions in which they had separated. By the difficulties and distresses of the crown, the Commons, who alone possessed the power of supply, had aggrandized themselves; and some were not sorry that the Irish rebellion had succeeded, at such a critical juncture, to the pacification in Scotland. An expression of the king's, by which he committed to them the care of Ireland, was immediately laid hold of, and interpreted in the most unlimited sense. On other occasions the Commons had been gradually encroaching on the executive power of the crown; but in regard to Ireland they now at once assumed it as if it had been delivered over to them by a regular assignment. They levied money under pretence of the Irish expedition, but reserved it for other purposes; they took arms from the king's magazines, but

reserved them for more immediate use. Yet though no forces were for a considerable time sent over to Ireland, and very little money remitted during the extreme distress of that kingdom, so strong was the attachment of the people to the Commons, that the fault was never imputed to persons whose votes breathed nothing but destruction and death to the Irish rebels.

In the meanwhile it was resolved to frame a general remonstrance on the state of the kingdom; and the committee, which at the meeting of the parliament had been chosen for that purpose, were commanded to finish their undertaking. The king returned from Scotland on the 25th of November 1641, and was received in London with shouts and acclamations by the people. Sir Richard Gournay, the lord-mayor, had promoted these favourable dispositions, and persuaded the populace, who had so lately insulted the king, and who so soon after made war upon him, to show these marks of respect. But all the pleasure which Charles had reaped from this reception was soon damped by the remonstrance of the Commons, which was presented to him, accompanied with a petition of similar import. The bad counsels which he had followed were there complained of; his concurrence in the Irish rebellion was plainly insinuated; the scheme laid for the introduction of popery and superstition was inveighed against; and, as a remedy for all these evils, the king was desired to intrust every office and command to persons in whom his parliament should see cause to confide. To this bitter remonstrance Charles found it necessary to make a civil reply. He knew that the public confidence was at that time denied to his ministers, more especially to such of them as had deserted the public cause; and that whilst men detested the servile insolence of Williams, the reckless levity of Digby, and the unblushing infamy of Saville, their faith and hope were strong in the inflexible virtues of Hampden, the mild integrity of Kimbolton, the ardent patriotism of Hollis, and the cool sagacity of Pym.

From this period the proceedings of the Commons became bolder, and more determined and violent. Finding themselves likely to be opposed by the nobility, who saw that their own degradation would speedily follow that of the crown, they openly told the Upper House that "they themselves were the representatives of the whole body of the kingdom, and that the Peers were nothing but individuals, who held their seats in a particular capacity; and therefore, if their Lordships would not consent to acts necessary for the preservation of the people, the Commons, together with such of the Lords as were more sensible of the danger, must join together and represent the matter to his majesty." Every method of alarming the country was now put in practice. Affecting continual fears of destruction to themselves and to the whole nation, they excited the people by never-ceasing inquiries concerning conspiracies, by reports of insurrections, by alleged rumours of invasion from abroad, and by discoveries of dangerous combinations at home. When Charles dismissed the guard which had been ordered them during his absence, they complained; and, on his promising them a new guard under the command of the Earl of Lindesay, they declined the offer. They ordered halberds to be brought into the hall where they assembled, and thus armed themselves against those conspiracies with which they pretended they were hourly threatened. During this time several reduced officers and young gentlemen of the inns of court offered their service to the king; and between them and the populace there occurred frequent skirmishes, which ended not without bloodshed. By way of reproach, these gentlemen gave the rabble the name of *Roundheads*, on account of their short cropped hair; whilst the latter distinguished their

Reign of Charles I. opponents by the name of *Cavaliers*; and thus the nation was furnished with party names, under which the factions might rendezvous and signalize their mutual hatred.

These tumults continued to increase about Westminster and Whitehall. The cry against the bishops continually resounded; and being easily distinguishable by their habit, as well as objects of violent hatred to all the sectaries, they were exposed to the most outrageous insults. In these circumstances, the Archbishop of York, having been abused by the populace, hastily called a meeting of his brethren; and by his advice a protestation was drawn up and addressed to the king and the House of Lords, setting forth, that though they had an undoubted right to sit and vote in parliament, yet in coming thither they had been menaced and assaulted by the multitude, and could no longer with safety attend their duty in the House; for which reason they protested against all laws, votes, and resolutions, as null and invalid, which should pass during the time of their forced absence. This ill-timed protestation was signed by twelve bishops, and communicated to the king. As soon as it was presented to the Lords, that house desired a conference with the Commons, whom they informed of this unexpected protestation. An impeachment of high treason was immediately sent up against the bishops, as endeavouring to subvert the fundamental laws, and to invalidate the authority of the legislature; and on the first demand they were sequestered from parliament, and committed to custody. No man in either house ventured to speak a word in their vindication. One individual alone remarked, that he did not believe them guilty of high treason; he only thought they were stark mad, and therefore desired that they might be sent to Bedlam.

This was a fatal blow to the royal interest, and it was aggravated by the imprudence of the king himself. Charles had long suppressed his resentment, and only strove to gratify the Commons by the greatness of his concessions; but finding all his compliances unavailing, he now gave orders to Herbert, the attorney-general, to enter an accusation of high treason, in the House of Peers, against Lord Kimbolton and five commoners, Sir Arthur Hazlerig, Hollis, Hampden, Pym, and Strode. The articles charged them with traitorously endeavouring to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; with inviting a foreign army to invade the kingdom; with aiming at subverting the very right and being of parliaments; and with actually raising and countenancing tumults against the king. Men had scarce leisure to wonder at the precipitation and imprudence of this impeachment, when they were astonished by another measure still more rash and unwarrantable. A serjeant at arms, in the king's name, demanded of the house the five members, and was sent back without any positive answer. This was followed by conduct still more extraordinary. Next day the king himself entered the House of Commons alone, and advanced through the hall, while all the members stood up to receive him. The Speaker withdrew from the chair, and the king took possession of it. Having seated himself, and looked round for some time, he told the house that he was sorry for the occasion that forced him thither, but that he was come in person to seize the members whom he had accused of high treason, seeing they would not deliver them up to his serjeant at arms. Then addressing himself to the Speaker, he desired to know whether any of the members were in the house. But the Speaker, falling on his knees, replied that he had neither eyes to see nor tongue to speak, in that place, but as the house was pleased to direct him; and he asked pardon for not being able to give any other answer. The king sat for some time to see if

the accused were present; but they had escaped a few minutes before his entry, and taken shelter in the city. Disappointed, perplexed, and not knowing on whom to rely, he next proceeded, amidst the invectives of the populace, who continued to cry out, "Privilege, privilege!" to the common council of the city at Guildhall, where he justified his proceedings respecting the fugitives, and expressed a hope that they would not find shelter or protection in the city. The common council answered his complaints by a disdainful silence; and, on his return, one of the populace, more courageous or insolent than the rest, cried out, "To your tents, O Israel!"

When the Commons assembled the next day, they affected or felt the greatest terror, and passed a unanimous vote that the king had violated their privileges, and that they could not assemble again in the same place, till they had obtained satisfaction, and a guard for their security. Meanwhile the king retired to Windsor, whence he wrote to his parliament, promising every satisfaction in his power. But they were resolved to accept of nothing unless he would discover his advisers in that illegal measure; a condition which they knew that, without rendering himself for ever vile and contemptible, he could not possibly submit to.

The Commons had already stripped the king of most of his privileges; the bishops were fled, the judges were intimidated; and it now only remained, after securing the church and the law, that they should also get possession of the sword. The power of appointing governors and generals, and of levying armies, still continued a prerogative of the crown. Having first magnified their terrors of popery, which perhaps they actually dreaded, the Commons proceeded to petition that the Tower might be put into their hands, and that Hull, Portsmouth, and the fleet, should be intrusted to persons of their choosing. Compliance with these requests was calculated to subvert what remained of the monarchy; but such was the necessity of the times, that they were first contested, and then granted. The Commons then desired to have a militia, raised and governed by such officers and commanders as they should nominate. But Charles hesitated. Being at that time in Dover attending the queen and the Princess of Orange, who was about to leave the kingdom, he replied that he had not now leisure to consider a matter of such great importance; and therefore would defer an answer till his return. The Commons, however, were well aware that they had gone too far to recede; and hence they were desirous of leaving him no authority whatever, conscious that they themselves would be the first victims of his free exercise. They alleged that the dangers and distempers of the nation were such as could endure no longer delay; and unless the king speedily complied with their demands, they would be obliged, both for his safety and that of the kingdom, to embody and direct a militia by the authority of both houses. In their remonstrance they also desired to be permitted to command the army for an appointed time; a request which so exasperated him, that he exclaimed with indignation, "No, not for an hour!" This peremptory refusal broke off all further treaty, and both sides now resolved to have recourse to arms.

CHAP. IV.

REIGN OF CHARLES I.: CIVIL WAR.

Charles, with his family, retires to York.—Fruitless negotiations.—State of the belligerent parties.—Inactivity of the parliamentary army.—Skirmish at Worcester.—Battle of Edgehill.—Association in favour of the King.—Fairfax defeated in the north.—Battle of Stratton.—Bristol taken by the royalists.

Reign of
Charles I.

—Siege of Gloucester.—Raised.—Battle of Newbury.—Advantages gained by Fairfax and Cromwell.—Lord Fairfax defeated at Atherton.—The Scots agree to assist the Parliament.—Solenn League and Covenant.—Dexterity of Vane.—King's Irish auxiliaries.—Dispersed at Lantwich.—Siege of York.—Royalists totally defeated at Marston-Moor.—Demands of the Parliament.—Execution of Laud.—Exploits of Montrose in Scotland.—Defeat of the Covenanters under Burley at Aberdeen.—Subsequent movements.—Devastation of Argyll's country.—Battle of Inverlochy.—Sack of Dundee.—Battles of Alderney and Alford.—Parliamentary army new-modelled by Cromwell.—Royalists defeated at Naseby.—Bristol taken.—Retreat of the King to Oxford.—Battle of Kilsyth.—Montrose defeated at Philiphaugh.—Charles throws himself on the Scottish army at Newark.—Negociations and proceedings in consequence.—Surrender of the King's person to the English.—The army usurp the sovereignty.—Seizure of the King by Cromwell.—Designs of the army resisted, but ineffectually.—Presbyterian members forced to leave the House.—Both parties treat with the King.—His resolution to quit the kingdom.—Seized and confined in the Isle of Wight.—Levellers.—Danger of Cromwell from this sect.—Put down.—The Scottish army under Hamilton defeated.—State of parties.—Cromwell enters Edinburgh in triumph, and settles the government of Scotland.—Negociations between the King and Parliament.—Pride's Purge.—Charges against the King.—His trial.—His sentence.—His execution.—Behaviour in his last moments.—Feelings of the nation on the King's death.

Charles, taking the Prince of Wales and the Duke of York along with him, retired, by slow journeys, to the city of York, where the people were more loyal, and less infected with the prevailing spirit of the times, than elsewhere. Here he found his cause backed by a more numerous party among the people than he had expected. The nobility and gentry from all quarters, either personally or by messages and letters, expressed their duty towards him; and the queen, who was then in Holland, had succeeded in levying men and procuring ammunition by selling the crown jewels. But before war was openly declared, the semblance of a negociation was kept up, rather with a view to please the people, than with any hope of reconciliation. Nay, that the king might despair of all composition, the parliament sent him the conditions on which they were willing to come to an agreement. Their demands were contained in nineteen propositions or articles, and in effect amounted to a total abolition of monarchical authority. It was required that no man should remain in the council who was not agreeable to parliament; that no deed of the king's should be held valid unless it passed the council, and was attested under their hand; that all the officers of state should be chosen with consent of parliament; that none of the royal family should marry without the consent of parliament or of council; that the laws should be executed against Catholics; that the votes of Catholic lords should be excluded; that the reformation of the liturgy and church government should proceed according to the advice of parliament; that the ordinance with regard to the militia should be acquiesced in; that parliament should judge all delinquents; that a general pardon should be granted, with such exceptions as might be advised by parliament; that the forts and castles should be disposed of by consent of parliament; and that no peers should be created but with consent of both houses. War on any terms was esteemed by the king and all his counsellors preferable to a peace on such ignominious terms. "If I should submit to these terms," said he, "I may have my hand kissed, and may retain the title of majesty, but I should remain but the outside, the picture, the sign of a king." Charles accordingly resolved to support his authority by force of arms. His towns, he said, were taken from him; his ships, his army, and his money. But there still remained to him a good cause, and the hearts of his loyal subjects, which, with God's

blessing, he doubted not would recover all the rest. Therefore, collecting some forces, he advanced southwards, and erected his royal standard at Nottingham.

The struggle now about to commence seemed, in many respects, exceedingly unequal. The king, indeed, was supported by a splendid nobility, and a large portion of the more considerable gentry, who, dreading a total confusion of ranks, enlisted themselves under the banner of their monarch, from whom they received, and to whom they communicated, lustre. The cordial concurrence of the bishops and church of England also increased the number of his adherents. But it may safely be affirmed, that the high monarchical doctrines so much inculcated by the clergy had been eminently prejudicial to his cause; while the bulk of the nobility and gentry who now attended the king in his distress breathed the spirit of liberty as well as of loyalty; and it was only in the hopes of his submitting to a limited and legal government that they were willing to sacrifice their lives and fortunes in his cause. On the other hand, the city of London, and most of the great corporations, took part with the parliament. In the capital, no less than four thousand men enlisted in one day; and the demand for a loan, by the parliament, was answered with so much alacrity, that the treasure flowed in faster than it could be received. All the sea-ports, except Newcastle, were also in the hands of the parliament; and the seamen naturally followed the party espoused by the ports to which they belonged. Add to this, that the example of the Dutch commonwealth, where liberty had so happily supported industry, made the commercial part of the nation desire to see a similar form of government established in England; whilst many families, who had enriched themselves by commerce, finding that, notwithstanding their opulence, they could not raise themselves to a level with the ancient gentry, adhered to a power by the success of which they hoped to acquire both rank and consideration.

At first every advantage seemed to lie against the royal cause. The king was totally destitute of money, while, from the causes already mentioned, the parliament were secure of a considerable revenue. They had begun by seizing all the magazines of arms and ammunition, and their fleet intercepted the greater part of the succours sent by the queen from Holland; so that the king, in order to arm his followers, was obliged to borrow the weapons of the trained bands, under promise of restoring them on the return of peace. The nature and qualities of his adherents alone gave the king some compensation for all the advantages possessed by his adversaries. More bravery and activity were hoped for from the generous spirit of the nobles and gentry, than from the baser disposition of the multitude; and as the landed gentlemen had levied and armed their tenants at their own expense, greater force and courage were to be expected from these rustic troops than from the vicious and enervated population of cities.

But the parliamentary forces were ill officered or ill directed, otherwise, with a disposable force of six thousand men, which lay within a few days' march of the royalists, they might have easily dissipated the small number of troops which the king had been able to collect, amounting to no more than eight hundred horse and three hundred foot. In a short time the parliamentary army marched to Northampton, where the Earl of Essex, who had joined them, found a force amounting to fifteen thousand men. The king's army too was soon reinforced from all quarters; but having no force capable of coping with the parliamentary army, he thought it prudent to retire to Derby, and thence to Shrewsbury, in order to cover the levies which his friends were making in those parts. At Wellington, a day's march from Shrewsbury, he assem-

Reign of
Charles I.

Reign of
Charles I.

bled his forces, amounting to near ten thousand men, and caused to be read at the head of every regiment his military orders, in which he protested solemnly before his whole army that he would maintain the Protestant religion according to the church of England; that he would govern according to the known statutes and customs of the kingdom; and that he would observe inviolate the laws to which he had given his consent during the present and preceding parliaments.

While Charles lay at Shrewsbury, he received the news of an action, the first that occurred in this unhappy contest, in which his party were victorious. On the appearance of civil commotion in England, the Princes Rupert and Maurice, sons of the elector palatine, had offered their services to the king; and the former at that time commanded a body of horse which had been sent to Worcester to watch the motions of Essex, who was then marching towards that city. The prince, however, had scarcely arrived, when he saw some of the enemy's cavalry approaching the gates. Without a moment's delay he attacked them as they were defiling from a lane and in the act of forming, killed their commander, Colonel Sandys, routed the whole party, and pursued them above a mile.

At this period military science and skill were at the lowest possible ebb in England; so much so, indeed, that, however much the contending parties might differ in spirit or in means, they were on a footing of perfect equality in ignorance of the principles and conduct of war. The hostile armies moved simultaneously, the king's from Shrewsbury, and the parliamentary from Worcester; but so totally destitute were both of intelligence, that they wandered about for ten days in absolute ignorance of each other's motions. At length, on the 23d of October 1642, they met at Keinton, or Edgehill, in the county of Warwick. The royalists were commanded in chief by the Earl of Lindesay, who had seen some service in the Low Countries, and now had under him Prince Rupert, master of the horse, Sir Jacob Astley in charge of the foot, Sir Arthur Aston commanding the dragoons, and Sir John Heydon the artillery. The general-in-chief of the parliamentary forces was the Earl of Essex, assisted by a number of subordinate officers as yet unknown to fame. In the encounter which immediately ensued, the royalists were at first victorious. Both wings of the parliamentary army were broken and put to flight by the onset of Prince Rupert's cavalry, supported by the troops under Aston and Wilmot; and if the royalist reserve had remained steady, the day would have been won. But thinking the victory already decided, they broke up from their position to join in the pursuit, and, whilst in the confusion produced by this disorderly movement, they were attacked by Sir William Balfour, who had anxiously watched their motions, with the parliamentary reserve, and defeated in their turn. Both armies then rallied, and faced each other for some time, neither party venturing to renew the attack: they lay all night under arms, and next day withdrew, Essex towards Warwick, and the king to his former quarters. Five thousand men, it is said, were left dead on the field in this bootless encounter. Soon afterwards, the king took Banbury and Reading, and defeated two regiments of his enemies at Brentford, taking five hundred prisoners. Thus ended the campaign of 1642, in which, though the king upon the whole had the advantage, yet the parliamentary army amounted to twenty-four thousand men, and was much superior to his. Nevertheless, his enemies had so far been humbled as to offer terms of peace. This led to the negotiations at Oxford. The terms required by the parliament as the condition of the king's recall, were the disposal of the militia, the abolition of Episcopacy, and the settlement of ecclesiastical controversies by

an assembly of divines. But considerable abatement would probably have been made in these demands if Charles had not been extravagant in his; and the failure of the negotiation is ascribed to the king's fidelity to an unhappy promise he had made to the queen to accede to no terms without her intervention and consent.

While the treaty was in dependence no cessation of hostilities took place. On the 27th of April 1643 Reading surrendered to the parliamentary forces under the Earl of Essex, who commanded a body of eighteen thousand men. In the north, the Earl of Northumberland united the counties of Northumberland, Cumberland, and Westmoreland, in a league for the king, and some time after engaged other counties in the same association. The same nobleman also took possession of York, and the Earl of Newcastle dislodged the forces of the parliament under Fairfax at Tadcaster; but his victory was not decisive. Other advantages were also gained by the royalists, the most important of which was at Stratton, where Waller, who commanded the parliamentary army, was entirely defeated, and forced to fly with only a few horse to Bristol. This happened on the 13th of July, and was followed by the siege of Bristol, which surrendered to Prince Rupert on the 25th of the same month.

Although the taking of Bristol cost the royalists dear, five hundred having fallen in the attempt to carry it by storm, yet their general success had greatly dispirited the opposite party; and the confusion which now prevailed at London was so great that some proposed to the king to march directly to the metropolis, which it was hoped might be reduced by an insurrection of the citizens, by victory, or by treaty, and thus put an end at once to the civil disorders. But this judicious advice was rejected; and it was resolved first of all to reduce Gloucester, that the king might have the whole course of the Severn under his command. By this means it was hoped that the rich but disaffected counties of the west, losing the protection of their friends, might be forced to pay large contributions as an atonement for their disaffection; that a communication might be maintained between Wales and these new conquests; and that half the kingdom, freed from the enemy, and united into one firm body, might be employed in re-establishing the king's authority throughout the remainder. The siege accordingly commenced on the 10th of August; but the town being defended by Massey, a resolute governor, and well garrisoned, made a vigorous defence. The consternation in London, however, was as great as if the enemy had already been at their gates; and in the midst of the general confusion a design was formed by Waller of forcing the parliament to accept of some reasonable conditions of peace. He imparted his design to some others; but a discovery being made of their proceedings, he and two others were condemned to death. Waller, however, escaped with a fine of £10,000. In the meanwhile Gloucester was reduced to the utmost extremity. A general assault had been repelled by the desperate enthusiasm of the garrison and city; but the means of prolonging the defence were now nearly exhausted. As a last resource, the parliament dispatched Essex with an army of fourteen thousand men to raise the siege. This he effected without much difficulty; and on entering the place he found only one barrel of gunpowder left, and the provisions nearly exhausted.

But on his return to London he was intercepted by the king's army, and a desperate battle ensued at Newbury, which lasted till night. Essex's horse were several times broken by the king's, but his infantry preserved its formation; and the front ranks presenting a formidable array of pikes, whilst those in the rear poured in a destructive fire, Prince Rupert and the gentry composing the royal caval-

Reign of
Charles I.

Reign of Charles I. ry were unable, notwithstanding the furious impetuosity of their attacks, to make any impression on its compact order. Night put an end to the contest, but left the victory undecided. On the side of the king fell the brave, accomplished, and virtuous Lord Falkland, one of the few personages to be met with in history whose life and death were equally honourable and glorious. Next morning Essex proceeded on his march to London; and although he had rather escaped a defeat than gained a victory, he obtained the approbation of parliament. The king followed in the same direction, and, having taken possession of Reading, he established a garrison there, and by that means straitened London and the quarters of the enemy.

In the north, during the summer, the Earl, now created Marquis, of Newcastle, had raised a considerable force for the king; and great hopes of success were entertained from that quarter. But there appeared, in opposition to him, two men, on whom the event of the war finally depended, and who about this time began to be remarked for their valour and military conduct. These were Sir Thomas Fairfax, son to the lord of that name, and Oliver Cromwell. The former gained a considerable advantage over the royalists at Wakefield, and took General Goring prisoner; the latter obtained a victory at Gainsborough over a party commanded by General Cavendish, who perished in the action. But both these defeats were more than compensated by the total rout of Lord Fairfax at Atherton Moor, and the dispersion of his army, which happened on the 31st of July. After this victory, the Marquis of Newcastle sat down before Hull with an army of fifteen thousand men; but, being beaten off by a sally of the garrison, he suffered so much that he thought it proper to raise the siege. About the same time Manchester advanced from the eastern associated counties, and having joined Cromwell and young Fairfax, defeated the royalists at Horne Castle, where the conduct and gallantry of these two rising officers were eminently conspicuous. But though fortune had thus balanced her favours, the king's party still remained much superior in the north; and had it not been for the garrison of Hull, which kept Yorkshire in awe, a junction of the northern forces with the army of the south might have enabled the king, instead of undertaking the imprudent enterprise against Gloucester, to march directly to London and put an end to the war. The indecisive battle of Newbury terminated the campaign of 1643, by both parties retiring into winter quarters.

The issue of the war being still doubtful, both the king and parliament began to look for assistance from other nations. The former looked to Ireland, the latter to Scotland. The parliament of England, at the commencement of the civil dissensions, had invited the Scots to interpose their mediation, which, however, the king had declined. Early in the spring of 1643 this offer was renewed, but with no better success than before. Commissioners were also empowered to urge on the king to a compliance with the presbyterian worship and discipline; but this he absolutely refused, as well as to call a parliament in Scotland; and the commissioners, finding themselves unable to prevail in any one of their demands, returned highly dissatisfied. Disappointed in all these views, the English parliament now sent commissioners to Edinburgh, to treat of a more close confederacy with the Scottish nation. The person in whom they principally confided on this occasion was Sir Harry Vane, who, in eloquence, address, and capacity, as well as in art and dissimulation, was not surpassed by any one in that age, so famous for men of active talents. By his persuasions was framed at Edinburgh the Solemn League and Covenant, which effaced all former protestations and vows taken in both kingdoms, and long maintained its credit and authority. In this covenant, the subscribers,

besides mutually engaging to defend each other against all opponents, bound themselves to endeavour, without respect of persons, the extirpation of popery, prelacy, superstition, heresy, and profaneness; to maintain the rights and privileges of parliaments, together with the king's authority; and to discover and bring to justice all incendiaries and malignants. They vowed also to preserve the reformed religion as established in the church of Scotland; but, by the artifice of Vane, no declaration more explicit was made with regard to England and Ireland, than that those kingdoms should be reformed according to the word of God and the example of the purest churches. This equivocal abjuration of prelacy completely blinded the Scottish Presbyterians, who, assuming their own to be the purest church, never doubted that it was intended to serve as a model for England. But, as a leader of the sect of Independents, Vane had other views, and artfully reserved a loophole of retreat whenever it should be convenient to dispense with the assistance of the Scots. Meanwhile the Solemn League and Covenant was received in the Scottish convention, and in the assembly of the kirk, with tears of enthusiastic joy, and transmitted to the English parliament and assembly of divines at Westminster, where, for different reasons, it was received with equal applause, and ordained to be universally subscribed in both kingdoms. By a treaty with the convention, twenty-one thousand Scottish troops were to be retained in arms at the expense of England, to be led by their own generals, and to receive orders from a committee of both kingdoms.

The king likewise, in order to secure himself, had concluded a cessation of arms with the Irish rebels, and recalled a considerable part of his army from Ireland. Some Irish Catholics came over with these troops, and joined the royal army, where they continued the same cruelties and disorders to which they had been accustomed; and the parliament voted that no quarter should ever be given them in any action. But Prince Rupert having made some reprisals, this inhumanity was repressed on both sides.

The campaign of 1644 proved very unfortunate to the royal cause. The forces brought from Ireland were landed at Mostyn in North Wales, and placed under the command of Lord Byron. They then besieged and took the castles of Hawarden, Beeston, Acton, and Deddington-house. No place in Cheshire or the neighbourhood now adhered to the parliament except Lantwich, and to it Byron laid siege in the depth of winter. Alarmed at this progress, Sir Thomas Fairfax assembled an army of four thousand men in Yorkshire, and having joined Sir William Brereton, approached the camp of the royalists. Byron and his soldiers, elated with success, entertained a most profound contempt for their enemies, and, as usual in such cases, paid dear for their absurd vanity. Fairfax suddenly attacked their camp, while the swelling of the river by a thaw divided one part of the army from the other. Those immediately opposed to Fairfax were quickly driven from their post, and having retired into the church of Acton, were surrounded and taken prisoners; the other part retreated precipitately without fighting; and thus was dissipated or rendered useless the body of auxiliaries from Ireland. This happened on the 25th of January. On the 11th of April ensuing Colonel Bellasis was totally defeated at Selby in Yorkshire by Sir Thomas Fairfax, who had returned from Cheshire with his victorious forces. Being afterwards joined by Lord Leven with the Scottish army, Fairfax, in conjunction with his ally, sat down before the city of York, but being unable to invest the city completely, they were obliged to content themselves with incommoding it by a loose blockade. Hopetoun, having assembled a body of fourteen thousand men, endeavoured to break into Sussex, Kent, and the southern association, which seem-

Reign of Charles I.

Reign of Charles I. ed well disposed to receive him; but he was defeated by Waller at Cherington. At Newark, however, Prince Rupert totally routed the parliamentary army which besieged that place, and thus preserved the communication open between the king's northern and southern quarters.

The great advantages which the parliament had gained in the north seemed now to second their enterprises, and finally to promise them success. Manchester having taken Lincoln, had united his army to that of Leven and Fairfax; and York was now closely besieged by their numerous forces. That town, though vigorously defended by the Marquis of Newcastle, was reduced to the last extremity, when Prince Rupert, having joined Sir Charles Lucas, who commanded Newcastle's horse, hastened to its relief with an army of twenty thousand men.

The Scottish and parliamentary generals raised the siege, and, drawing up on Marston-moor, prepared to give battle to the royalists. By a dexterous movement, or rather by masking his movements, Rupert, interposing the Ouse between him and the enemy, threw military stores and provisions into York, and joined his forces with those under Newcastle. The marquis then endeavoured to persuade him, that, having successfully effected his purpose, he ought to be contented with the present advantage; remain on the defensive at least till an expected reinforcement arrived; and leave the enemy, diminished by losses, and discouraged by ill success, to dissolve by the mutual dissensions which had begun to take place among them. The prince, however, hurried on by his natural impetuosity, gave immediate orders for fighting. His forces occupied Marston-moor; those of his opponents were posted in the adjacent fields; and both sides were nearly equal in numbers. Fifty thousand British subjects were now drawn up in order of battle, and ready to begin the work of mutual destruction. After an ineffectual cannonade across a bank and ditch which separated the two armies, the signal for close combat was given nearly at the same instant by both sides. A moment of silent suspense followed, each party expecting that the other would begin the attack. But evening approached, and no time was to be lost. At the head of the left wing of the parliamentary army Cromwell and David Leslie crowned the bank, drove back Rupert's right wing, dispersed his cavalry, and overpowered part of his centre. A different fortune awaited the right wing of the parliamentary army, where young Fairfax commanded. Charged with irresistible impetuosity by General Hurry, it was beaten back in disorder; and a reserve of the Scottish infantry, which moved to its support, was also cut up with astonishing celerity. The royalists then pushed for the enemy's baggage, and began to plunder. But while they were thus occupied, Cromwell and Leslie wheeled round and restored the battle. The parliamentary right wing now rallied on the left, and the whole army having changed its front, drew up in a position at right angles to that which it had occupied at the commencement of the battle. The royalists did the same, and the combat was renewed with great fury on both sides. But fortune soon declared in favour of the parliamentarians. The shock, though bloody, was brief, and the victory decided by Leslie's three Scottish regiments and Cromwell's brigade of ironsides. The royal army was driven off the field, and its whole artillery taken.

Immediately after this unfortunate action the Marquis of Newcastle left the kingdom, while Prince Rupert retired into Lancashire. The city of York surrendered in a few days, and Newcastle was soon afterwards taken by storm. This was a fatal blow to the royal cause, and far from being counterbalanced by an advantage gained at Cropredy-bridge by the king over Waller, or even by the surrender

of Essex's forces, which happened on the 1st of September. On the 27th of October another battle was fought at Newbury, in which the royalists were worsted; but soon after they retrieved their honour at Dennington Castle, which finished the campaign in 1644.

In 1645 negotiations were renewed, and the commissioners, sixteen from Charles, twelve from the parliament, and four from the Scots, assembled at Uxbridge on the 30th of January; but it was soon found impossible to come to any agreement. The demands of the parliament were exorbitant, and, what was worse, their commissioners alleged that these were nothing but preliminaries. The king was required to attain, and except from a general pardon, forty of the most considerable of his English, and nineteen of his Scottish subjects, together with all the popish recusants who had borne arms for him. It was insisted that forty-eight more, with all the members of either house who had sat in the parliament called by the king at Oxford, all lawyers and divines who had embraced the king's party, should be rendered incapable of any office, be forbidden the exercise of their profession, be prohibited from coming within the verge of the court, and should forfeit the third of their estates to the parliament. It was required, that whoever had borne arms for the king should forfeit the tenth of their estates, or, if that did not suffice, the sixth, for the payment of public debts. And, as if such terms would not have sufficiently annihilated the royal authority, it was further demanded that the court of wards should be abolished; that all the considerable officers of the crown, and particularly the judges, should be appointed by parliament; and that the right of peace and war should not be exercised without consent of parliament. Considerable abatement was, however, made in these rigorous demands; and as the rising power of the Independents made it the interest of the Presbyterians to conclude peace, if it could be done with any degree of safety, the treaty was now limited to the three subjects of religion, the militia, and Ireland. On the first, the king's enemies required the abolition of prelacy, the confirmation of the acts of the assembly of divines at Westminster, and the ratification of the Solemn League and Covenant, with an injunction to all to take it, beginning with the king himself; on the second, the management of the militia till seven years after the peace, and an act of mutual oblivion; on the third, or Ireland, a cessation of arms, and the surrender to parliament of the direction of the war, and of the power of concluding peace without their consent. But, after a great deal of fruitless negotiation, Charles ultimately refused to concede any of these points, and the treaty was in consequence broken off. The news of Montrose's victories in Scotland, and the hope of ten thousand men under the Duke of Lorraine, which the queen had stipulated for, are alleged to have been the chief causes of the failure of the treaty. A little before the commencement of this negotiation, the parliament, to show their determined resolution to proceed as they had begun, brought to the block Archbishop Laud, who had for a considerable time been a prisoner in the Tower, and was no longer capable of giving offence, or rendering himself dangerous to any one. The sacrifice of this weak, wicked, and unfortunate man; was therefore, politically considered, an act of bootless severity, and as such ought to be condemned.

But while the king's affairs were daily becoming worse in England, they seemed to revive a little in Scotland, through the conduct and valour of the Earl of Montrose. On his return from his travels, Montrose had been introduced to the king; but not meeting with an agreeable reception, he went over to the Covenanters, and had been active in forwarding all their schemes. Being commis-

Reign of Charles I. sioned, however, by the tables to wait upon the king while the army lay at Berwick, he was gained over by the civilities and caresses of that monarch, and thenceforth devoted himself entirely, though secretly, to his service. Having attempted to form an association in favour of the royal cause, Montrose was thrown into prison; and on his release, which he managed to obtain, he found the king ready to give ear to his counsels, which were of the boldest and most daring kind. The whole nation of Scotland was occupied by the Covenanters; considerable armies were kept on foot by them, and every place was guarded by a vigilant administration; yet, by his own credit, and that of a few friends who remained to the king, this bold renegade undertook to raise such commotions as should soon oblige the malcontents to recal the forces which had so sensibly turned the balance in favour of the English parliament. The defeat at Marston-moor had left him no hopes of any succours from England; he was therefore obliged to stipulate with the Earl of Antrim for a supply of men from Ireland. And having used various disguises, as well as passed through many dangers, he arrived in Scotland, where he lay for some time concealed on the borders of the Highlands.

Although the Irish did not exceed eleven hundred foot, very ill armed, Montrose immediately put himself at their head; and, being joined by thirteen hundred Highlanders, he attacked Lord Eleho, who lay at Tibbermore, near Perth, with six thousand men, and utterly defeated him, killing two thousand of the Covenanters. He next marched northwards in order to rouse the Marquis of Huntly and the Gordons, who had before taken arms, but had been overpowered by the Covenanters. At Aberdeen he attacked and entirely defeated Lord Burley, who commanded two thousand five hundred men. But by this victory Montrose did not obtain the end he proposed; for the Marquis of Huntly showed no inclination to join an army where he was sure to be eclipsed by a powerful and daring genius acting from its own impulses.

Montrose was now in a very dangerous situation. Argyll, reinforced by the Earl of Lothian, was behind him with a great army; while the militia of the northern counties of Moray, Ross, and Caithness, to the number of five thousand, opposed him in front, and guarded the banks of the Spey, a deep and rapid river. In order to save his troops, he turned aside into the hills; but, after some marches and counter-marches, Argyll came up with him at Faivy Castle. Here, after some skirmishes, in which he was victorious, Montrose got clear of a superior army, and, by a quick march through almost inaccessible mountains, placed himself absolutely beyond their reach.

But it was the misfortune of this general, that good or ill fortune proved equally destructive to his army. After every victory his Scottish adherents went home with the spoil they had collected; and had his army been composed of these only, he must soon have been altogether abandoned. But the Irish under his command, having no place to which they could retire, adhered to him in every fortune. With these, therefore, and some reinforcements of Atholemen and Maedonalds, Montrose fell suddenly upon Argyll's country, letting loose upon it all the horrors of war in their most savage form. Having collected three thousand men, Argyll marched in quest of the enemy, who had retired with their plunder, and took up a position at Innerlochy, supposing himself to be still at a considerable distance from his antagonist. While this force had thus established itself in front, the Earl of Seaforth, at the head of the garrison of Inverness and a body of five thousand new levied troops, pressed the royalists on the other side, and threatened them with total destruction. The situation of Montrose was critical in the extreme; but a stroke of genius

and fortune relieved him, and brought back victory to his standard. By a rapid and unexpected march he hastened to Innerlochy, and presented himself in order of battle before the Covenanters at the head of about eighteen hundred men. Argyll, seized with a panic, deserted his army, and, at a secure distance, having pushed off from the shore of the loch in a boat, witnessed the conflict which he had not the courage to share. The Campbells, however, made a stout resistance, but were at last defeated and pursued with great slaughter. After this victory, Montrose was joined by great numbers of Highlanders; Seaforth's army dispersed of itself; and the Lord Gordon, eldest son of the Marquis of Huntly, having escaped from his uncle Argyll, who had hitherto detained him, now joined Montrose with a considerable number of his followers, accompanied by the Earl of Aboyne.

Reign of Charles I. Alarmed at these victories, the council at Edinburgh sent for Baillie, an officer of reputation, from England, and, joining him in command with Urrey, dispatched them with a considerable army against the royalists. Montrose, with a detachment of eight hundred men, had attacked Dundee, a town remarkable for its zeal in favour of the covenant, carried it by assault, and given it up to be plundered by his soldiers, when Baillie and Urrey with their whole force suddenly came upon him. He instantly called off his soldiers from the plunder, put them in order, covered his retreat by a series of skilful manœuvres, and, having marched sixty miles in the face of a superior enemy without stopping or allowing his soldiers the least time for sleep or refreshment, he at last secured himself in the mountains. His antagonists now divided their forces, in order to carry on the war against an enemy who surprised them as much by the rapidity of his marches as by the boldness of his enterprises. Urrey met him with four thousand men at Auldearn, near Inverness, and, trusting to his superiority in number, Montrose having only two thousand men, attacked him in the post which he had chosen. Montrose posted his right wing on some strong ground, and drew the best of his forces to the other, leaving no main body between them; a defect which he artfully concealed by showing a few men through the trees and bushes with which the ground was covered. And, that Urrey might have no leisure to discover the stratagem, he instantly led his left wing to the charge, and made a furious onset on the Covenanters, whom he drove from the field in complete disorder. Baillie now advanced to revenge Urrey's defeat, and re-establish, if possible, the credit of the popular arms. But he himself met with a similar fate at Alford. Montrose, weak in cavalry, intermixed his troops of horse with platoons of infantry, and, having put his enemy's horse to rout, fell with united force upon their foot, which were entirely cut in pieces, though with the loss of the gallant Lord Gordon on the part of the royalists. Victorious in so many battles, which his vigour had rendered as decisive as they were successful, Montrose now prepared to march into the southern counties, in order to put down the power of the Covenanters, and disperse the parliament, which had been ordered to assemble at St Johnstone or Perth.

While Montrose was thus signaling his valour in the north, Fairfax, or rather Oliver Cromwell under his name and sanction, employed himself in new-modelling the parliamentary army, and throwing the whole into a different and much more effective form. And never perhaps was there a more singular army established than that which was now re-organized by the parliament. To the greater number of the regiments chaplains were not appointed: the officers assumed the spiritual duty, which they united with their military functions. During the intervals of action they occupied themselves in sermons, prayers, and

Reign of
Charles I.

exhortations. Rapturous ecstasies supplied the place of study and reflection; and whilst the zealous devotees poured out their thoughts in unpremeditated harangues, they mistook the natural eloquence which flowed from an excited and enthusiastic temperament, for illuminations and illapses of the Holy Spirit. Wherever they were quartered, they excluded the minister from his pulpit, and, usurping his place, conveyed their sentiments to the audience with all the authority that belonged to their power, their valour, and their military exploits, united with zeal and fervour. The private soldiers were infected with the same spirit; and such an enthusiasm seized the whole army as perhaps has scarce ever been equalled in the history of the world. The royalists ridiculed the fanaticism of the parliamentary armies, without being sensible how much reason they had to dread its effects. They were at this time equal, if not superior, in numbers to their enemies, but so licentious in their conduct, that they had become more formidable to their friends than to their enemies. The commanders were most of them men of dissolute characters; in the west especially, where Goring commanded, universal spoil and havoc were committed; the whole country was laid waste by the excesses of the royalist army; and even the most devoted friends of church and state longed for success to the parliamentary forces in these parts, as the only mode in which a stop could be put to these frightful disorders.

The natural consequence of this enthusiasm in the parliamentary army, and this licentiousness in that of the king, was, that equal numbers of the latter were no longer able to maintain their ground against the former. This appeared conspicuously in the decisive battle of Naseby, which was fought between forces nearly equal. Prince Rupert, by his furious onset, broke the wing of the enemy opposed to him, hut, as usual, pursued too far. Cromwell also bore down the wing of the royalists opposite that which he commanded; but instead of imitating the example of the impetuous prince, he sent a detachment in pursuit, and executing what is technically called a *quart de conversion*, attacked the exposed flank of the centre, where the royalist infantry were pressing hard on Fairfax. The result of this movement was decisive. When Rupert returned from pursuit the battle was irretrievably lost. The king called out to make but one charge more and the day would be their own; but his artillery and baggage being already taken, his infantry destroyed, and the prince's cavalry wholly exhausted by their exertions, it was now too late to attempt any such effort. After an obstinate struggle, Charles was entirely defeated, with the loss of five hundred officers and four thousand private men prisoners, and all his artillery and ammunition, while his infantry were totally dispersed.

After this fatal battle, the king retired first to Hereford, then to Abergavenny, and remained some time in Wales, in the vain hope of raising a body of infantry in these quarters, already harassed and exhausted. His affairs now went to ruin in all quarters. Fairfax retook Leicester on the 17th of June; and on the 10th of July he raised the siege of Taunton, while the royalists retired to Lampport, an open town in the county of Somerset. Here they were attacked by Fairfax, and driven from their position, with the loss of three hundred killed and fourteen hundred taken prisoners. This was followed by the loss of Bridgewater, which Fairfax took three days after, making the garrison, to the amount of two thousand six hundred men, prisoners of war. He then reduced Bath and Sharburn; and on the 11th of September Bristol was surrendered by Rupert, though a few days before he had boasted, in a letter to Charles, that he would defend the place for four months. This so enraged the king, that he immediately

recalled all the prince's commissions, and sent him a pass to go beyond sea.

In the mean time the Scots, having made themselves masters of Carlisle after an obstinate siege, marched southwards and invested Hereford, but were obliged to raise the siege on the king's approach. This was the last glimpse of success that attended his arms. Having marched to the relief of Chester, which was anew besieged by the parliamentary forces under Colonel Jones, his rear was attacked by Poyntz, and an engagement immediately ensued. The fight was maintained with great obstinacy, and victory seemed to incline to the royalists, when Jones fell upon them from the other side, and defeated them with the loss of six hundred killed and a thousand taken prisoners. The king, with the remains of his army, fled to Newark, and thence escaped to Oxford, where he shut himself up during the winter season. After the surrender of Bristol, Fairfax and Cromwell, having divided their forces, marched, the former westwards in order to complete the conquest of Devonshire and Cornwall, and the latter to attack the king's garrisons to the eastward of Bristol. Nothing was able to stand before these victorious generals; every town was obliged to submit, and every body of troops which ventured to resist them were utterly defeated.

At last news arrived that Montrose himself, after some more successes, had been defeated; and thus the only hope of the royal party was destroyed. When he had descended into the southern counties, the Covenanters, assembling their whole force, met him with a numerous army, and gave him battle at Kilsyth. But here he obtained a memorable victory. Of the Covenanters above four thousand were killed on the spot, and no remains of an army left them in Scotland. Many noblemen, who had secretly favoured the royal cause, now declared openly for it, when they saw a force able to support them. The Marquis of Douglas, the Earls of Annandale and Hartfield, the Lords Fleming, Seton, Maderty, Carnegy, and many others, flocked to the royal standard. Edinburgh opened its gates and gave liberty to all the prisoners detained there by the Covenanters, and amongst the rest to Lord Ogilvy, son to the Earl of Airly, whose family had contributed essentially to the victory gained at Kilsyth. David Leslie was now detached from the army in England, and marched to the relief of his distressed party in Scotland. Allured by vain hopes of rousing to arms the Earls of Hume, Traquair, and Roxburgh, who had promised to join him, and of obtaining from England some supply of cavalry, in which he was still very deficient, Montrose advanced still further to the south. But by the negligence of his piquet, or more probably from security engendered by success, Leslie surprised his army at Philiphaugh in the Forest, then much diminished in numbers from the desertion of the Highlanders, who, according to custom, had retired to the hills to secure their plunder. After a sharp conflict, in which Montrose displayed great valour, his forces were routed by Leslie's cavalry, and he was himself forced to fly to the mountains.

In the situation to which the king was now reduced, he resolved to grant the parliament their own terms, and sent them repeated messages to this effect; but a considerable time elapsed before they deigned to make him any reply. At last, after reproaching him with the blood spilt during the war, they informed him that they were preparing some bills, to which, if he would consent, they should then be able to judge of his pacific inclinations. In the mean time Fairfax was advancing with a victorious army in order to lay siege to Oxford; and Charles, rather than submit to be taken captive and led in triumph by his insolent subjects, resolved to give himself up to the Scots, who had never testified such implacable animosity against him,

Reign of
Charles I.

Rem of and to trust to their loyalty for the rest. After passing
Charles I. in disguise through many bye-ways and cross-roads, he arrived, in company with only two persons, Dr Hudson and Mr Ashburnham, at the Scottish camp before Newark, and immediately discovered himself to their general Lord Leven.

This resolution, though adopted in the midst of disaster, seems to have been formed by the king in hopes of dividing his enemies, and profiting by their dissensions, of which, indeed, any prince in his situation would not have hesitated to avail himself. Nor were there wanting circumstances to justify a measure which, because it proved unfortunate, has generally been considered as rash and ill-advised. The Presbyterian form of church government had indeed been adopted in England, under the sanction of the divines assembled at Westminster; but the parliament steadily refused to render the church supreme, and to disjoin it from all connection with the state. The Independents, also, had combined with the Erastians in parliament to procure a charitable indulgence of conscience, or, in other words, unlimited though tacit toleration of all sects and opinions; a proceeding which the English as well as Scottish Presbyterians resisted as at once incompatible with the covenant, and favourable to boundless latitudinarianism. Nor were there wanting other causes of deep offence to exasperate the Scots. Their pay was in arrear; their supplies were neglected; their cautionary garrisons in the north were demanded back; their free quarters were refused. Ever since the battle of Naseby the Presbyterian, and with it the Scottish, influence had declined, whilst that of the Independents became every day stronger and stronger. Symptoms of an approaching schism, if not collision, were apparent. Is it to be wondered that, in these circumstances, Charles, who had already maintained a secret correspondence with the two factions of his enemies, should have now calculated on widening, by his presence with one of them, the breach that had so evidently taken place? His previous views, as expressed in a confidential letter to Lord Digby, were "to draw either the Presbyterians or the Independents to side with him," and to render whichever of the two he succeeded in gaining instrumental in extirpating the other; "so that," as he says, "I shall really be king again." Nor is there any reason to doubt that, in betaking himself to the Scottish camp, the real design of the king was to endeavour to effect the object here so distinctly declared.

On the authority of an intercepted letter of the king, it has been asserted that he threw himself on the Scottish army in consequence of an assurance that they would assist him in recovering his lost prerogative, unite with the forces under Montrose, and compel the English parliament to accept a peace. In a declaration still extant, however, the Scottish leaders disclaim, in the strongest terms, any public or private agreement whatsoever with the king; and as this disclamation, which was publicly made, received no contradiction at the time, the reasonable conclusion is, that it could not be disputed. It is no doubt true that an agreement had been concerted, through Montreville the French ambassador, by which the Scots, with the knowledge and approbation of the English Presbyterians, were to escort the king to their camp. But the treaty was broken off by the refusal of the Scots to co-operate with Montrose, and by the king's hesitation to sanction and confirm the Presbyterian form of church establishment. The Scots seem, therefore, to have been perfectly sincere in their declaration to the English parliament. Charles came amongst them of his own proper motion, and not in consequence of any stipulation on their part to unite with him against their English allies; and whatever discontents

might have arisen in England, such a stipulation to support the king, without first exacting from him an unequivocal pledge to grant all the objects for which they had taken up arms, would have been the height of folly, and a sacrifice of great national interests to a romantic sentiment. Accordingly, they remained faithful to their original engagements; and although they withdrew to Newcastle to prevent the English intercepting their return home, they obtained the king's order for the surrender of Newark, guarded his person with respectful vigilance, and openly professed their resolution to avail themselves of the advantage they had thus acquired, in order to obtain the desired conformity in religion, and the establishment of peace on a durable basis.

Next came the negotiations between the Scots and English for the payment of arrears due to the former, and for the surrender of the king's person into the hands of the latter. The arrears, after many deductions, were finally settled at L.400,000; and this adjustment has been perpetually identified by historians with the agreement to deliver up the king's person, and represented as the equivalent given, or the price paid, for an act of unparalleled baseness. The confusion of facts, however, is as gross as the stigma attached to the Scottish nation is undeserved. The amount of the arrears was fixed in August. In November the question as to the disposal of the royal person remained still unsettled. At this time the Scottish parliament, indignant at a vote passed by the English parliament in September (a month after the settlement of the arrears) claiming the sole disposal of the king's person, resolved to maintain the freedom of the king, and assert his right to the English throne; but the vote was afterwards rescinded, on the just ground that it amounted to an abandonment of the solemn league and covenant, adopted in concert with the English Presbyterians, unless their joint demands were granted by the king. They offered, however, to reinstate him on the throne, and to obtain for him a just settlement with his English subjects, provided he would consent to take the covenant; and commissioners were appointed by the estates in Scotland to signify to his majesty these conditions, upon which alone he could expect to be received in Scotland, or assisted by the Scottish nation. But the king remained inflexible. In vain did the Duke of Hamilton, one of his principal friends in Scotland, unite with the ministers in representing that this alone could save him; in vain was it urged that if he conceded the Presbyterian church to both kingdoms, the demands respecting the militia would be relaxed, that all Scotland would declare in his favour, and that, while the Presbyterians remained numerous and powerful, few in England would venture to oppose the reconstitution of the monarchy with limited power. Nothing could move him to accede to that which alone could save him. On the eve of his departure, the commissioners renewed with great earnestness their offers to conduct him to Berwick, and to procure more equitable terms, provided he would take the covenant; and so anxious were they to save him, that a bare promise to comply with their religious demands would have been deemed sufficient. But all that could be wrung from this unhappy prince was a doubtful consent to tolerate Presbytery for three years; and even in making this concession, he justified it to his own curious conscience, by declaring before two of his bishops his unalterable resolution to restore and uphold Episcopacy. In the case of a sovereign cursed with such blind and obstinate infatuation, what else could be done but leave him to his fate?

It has been mentioned as a circumstance reflecting disgrace on the Scots, that the English parliament still withheld their arrears, and that the surrender of the king's

Reign of
Charles I.

person was the only condition upon which payment could be obtained. If the case had really stood so that the refusal of the Scots to deliver up Charles would have been punished only by defrauding them of the money which was justly due to them, and by no other consequence whatever, then the charge of selling the king for prompt payment might well have been alleged against them. But it must be obvious that the loss of the arrears, upon which so much stress has always been laid, was a mere trifle in comparison with the misery and bloodshed which must have ensued from drawing the sword in defence of the king, without first securing the grand objects of the covenant. Conduct such as this, on the part of the Scottish leaders, would have amounted to a violation of their solemn oaths, and a betrayal of the great national interests intrusted to their guardianship. They offered all that men, circumstanced as they were, could offer; they were willing, at any hazard, to adhere to the king, if the king would have been true to the country; and his refusal to accede to the terms proposed to him shows, that, if the Covenanters had conquered all England in his cause, they would only have rivetted more firmly the chains of Episcopacy and tyranny on themselves.¹

After the flight of Charles, Oxford surrendered to Fairfax, and the civil war terminated exactly four years after the king's standard was first erected at Nottingham. In consequence of the transactions at Newark, and the total failure of all attempts at an accommodation with the Presbyterians, the king was delivered over to the English commissioners, and conducted under a guard to Holdenby, in Northamptonshire, where he was very rigorously confined, and debarred from visits of his friends, as well as all communication with his family.

The civil war being thus ended, the king absolved his followers from their allegiance, and the parliament had now no enemy to fear but the troops which had fought for them. But it was not long before they found themselves in the same unfortunate predicament to which they had reduced the king. The majority of the house were Presbyterians, but the majority of the army were Independents. Soon after the retreat of the Scots, the former seeing every thing reduced to obedience, proposed to disband a considerable part of the army, and send the rest over to Ireland. But this was by no means relished by the Independents, and Cromwell took care to heighten the disaffection. Instead of preparing to disband, therefore, the soldiers resolved to petition, and began by demanding an indemnity, ratified by the king, for any illegal actions they might have committed during the war. But the Commons voted that this petition tended to introduce mutiny, and threatened to proceed against the promoters

of it as enemies to the state and disturbers of the public peace. The army accordingly began to set up for themselves, and a military parliament was organized, in opposition to the parliament at Westminster. The principal officers formed a council to represent the body of Peers; the soldiers elected two men out of each company, called the *agitators* of the army, to represent the Commons; and of this assembly Cromwell took care to be a member. The new parliament soon found many grievances to be redressed, and specified some of the most considerable. The Commons were obliged to yield to every request, and the demands of the agitators rose in proportion to the concessions they extorted. The Commons accused the army of mutiny and sedition; but the army retorted the charge, and alleged that the king had been deposed only to make way for their usurpations. In the mean time Cromwell, who secretly conducted all the measures of the army, while he exclaimed against their violence, resolved to seize the king's person. Accordingly a party of five hundred horse appeared at Holmby Castle, under the command of one Joyce, originally a tailor, now a cornet; and by this man was the king conducted to the army, who were hastening to their rendezvous at Triplow Heath, near Cambridge. Next day Cromwell arrived, and being received with acclamations of joy, was immediately invested with the supreme command. The Commons now discovered the designs of the army; but it was too late. All resistance had become hopeless. Cromwell advanced with precipitation, and was in a few days at St Alban's. Even submission was now to no purpose. The army still rose in their demands, in proportion as these were gratified, and at last proclaimed their intention of modelling the whole government, as well as settling the nation.

Cromwell began with accusing eleven members of the house, leaders of the Presbyterian party, as guilty of high treason, and enemies to the army. The Commons were willing to protect them; but the army insisting on their dismissal, they voluntarily left the house. At last the citizens of London, finding the constitution totally overturned, and a military despotism about to be established on the ruins of the kingly tyranny which they formerly dreaded, began to think seriously of repressing the insolence of the troops. The common council assembled the militia of the city; the works were manned; and a manifesto was published, aggravating the hostile intentions of the army. Finding that the Commons, in compliance with the request of the army, had voted that the city militia should be disbanded, the multitude rose, besieged the door of the house, and obliged them to reverse the vote which they had so lately passed. The assembly was in consequence divided into two parties; the greater part siding

¹ The comments which Mr Hume has thought it proper to make on this unfortunate transaction are sufficiently met and answered by the statements contained in the text. The following defence of the Scots against the accusations which have been so freely preferred in consequence of the transactions at Newark, will, however, be read with interest, as proceeding from a writer who will not be suspected of any undue partiality to the Covenanters, namely, Sir George Mackenzie of Rosehaugh, Lord Advocate of Scotland in the reigns of Charles II. and James VII. "The parliament of Scotland (1661)," says he, "taking to their consideration how much and how unjustly this kingdom was injured by an aspersion cast upon it for the transactions at Newcastle in anno 1647, at which time the king was delivered to the parliament of England; which was called in some histories a selling of the king; did by an express act condemn and reprobate all that treaty, and declare that the same was no national act, but was only carried on by some rebels who had falsely assumed the name of a parliament. Nor wanted there many, even in that parliament, who protested against all that procedure, and who had the courage and honesty to cause registrate that protestation. And I must here crave leave to expostulate with our neighbours of England, for inveighing so severely against our nation for delivering their king, seeing he was only delivered up to the then parliament, who first *imprisoned* and thereafter *murdered* him: whereas how soon even our rebels discovered their design, they carried into England a splendid mighty army for his defence; and when his murder came to their ears, they proclaimed his son their king, and sent commissioners to treat with him and bring him to Scotland; and when he was arrived they did contribute their lives and fortunes for his safety. And albeit some bigot Presbyterians did use him unkindly out of too much kindness to their own principles, yet even these did very generously oppose Cromwell, and such as had murdered the king; as is clear by the attack made by Major-general Montgomery at Musselburgh, and by the remonstrators at Linlithgow. They fought also two battles for him at Dunbar and Worcester, and suffered the greatest imaginable hardships." (*Memoirs of the Affairs of Scotland, from the Restoration of King Charles II. A. D. 1660.* By Sir George Mackenzie of Rosehaugh. Printed at Edinburgh in 1821, and edited by Thomas Thomson, Esq. Depute Clerk Registrar of Scotland.)

Reign of Charles I. with the citizens, but the minority, with the two speakers at their head, being for encouraging the army. Accordingly the two speakers, with sixty-two of the members, secretly retired from the house, and threw themselves on the protection of the army, which was then at Hounslow Heath. They were received with shouts and acclamations; their integrity was extolled; and the whole force of the soldiery, to the number of twenty thousand men, now moved forward to reinstate them in their places.

In the meanwhile the part of the house which was left resolved to resist the encroachments of the army. They chose new speakers, gave orders for enlisting troops, and ordered the train-bands to man the lines; while the whole city boldly resolved to resist the invasion. But this resolution only held while the enemy was at a distance. When Cromwell appeared, all was obedience and submission; and the gates were opened to the general, who attended the two speakers and the rest of the members peaceably to their habitations. The eleven impeached members having been accused as the cause of the tumult, were expelled, and most of them retired to the Continent. The mayor, the sheriff, and three aldermen, were sent to the Tower; several citizens and officers of the militia were committed to prison; the lines about the city were levelled with the ground; and the command of the Tower was given to Fairfax.

It now only remained to dispose of the king, who continued a prisoner at Hampton Court. The Independent army, at the head of which was Cromwell, on the one hand, and the Presbyterians, in name of both houses, on the other, treated with him separately in private. He had sometimes even hopes, that in these struggles for power, he might be chosen mediator in the dispute; and he expected that the kingdom, at last sensible of the miseries of anarchy, would of its own accord relapse into tranquillity. At this time he was treated with flattering marks of distinction, and allowed to converse with his own servants; whilst his chaplains were permitted to attend him, and celebrate divine service in their own way. But the most exquisite pleasure he enjoyed was in the company of his children, with whom he had several interviews. The meeting on these occasions was so touching, that Cromwell himself, who happened once to be present, could not help being moved, and was heard to declare that he never before beheld such an affecting scene. But these instances of respect were not of long continuance. As soon as the army had gained a complete victory over the House of Commons, the king was treated not only with the greatest disrespect, but even kept in continual alarm for his personal safety. The consequence was, that Charles at last resolved to withdraw himself from the kingdom.

Accordingly, on the 11th of November 1647, the king, attended only by Sir John Berkeley, Ashburnham, and Leg, privately left Hampton Court; and his escape was not discovered till nearly an hour afterwards, when those who entered his chamber found on the table some letters directed to the parliament, to the general, and to the officer who had attended him. He travelled all night through the forest, and arrived next day at Titchfield, a seat of the Earl of Southampton, occupied by the countess dowager, a woman of honour, to whom the king knew he might safely intrust his person. Before he arrived at this place, he went to the sea-coast, and expressed great anxiety that a ship, which he seemed to look for, had not arrived. As he could not hope to remain long concealed at Titchfield, the question was, what measure should next be embraced? In the neighbourhood lay the Isle of Wight, of which Hammond was governor. This man was a dependent of Cromwell's, which was an unfavourable circumstance; yet as he was nephew to Dr Hammond, the king's

favourite chaplain, and had acquired a good reputation in the army, it was thought proper to have recourse to him in the present emergency, when no other rational expedient could be thought of. Ashburnham and Berkeley were accordingly dispatched to the island. They had orders not to inform Hammond of the place where the king lay concealed, till they had first obtained from him a promise not to deliver up his majesty, even though the parliament and army should require him, but restore him to his liberty, if he could not protect him. The promise would have been but a slender security; yet, even without exacting it, Ashburnham imprudently, if not treacherously, brought Hammond to Titchfield; and the king was obliged to put himself into his hands, and to attend him to Carisbrooke Castle in the Isle of Wight, where, though he was received with great demonstrations of respect and kindness, he was in reality a prisoner.

While the king continued in this forlorn situation, Cromwell found himself upon the point of losing all the fruits of his schemes, by having his own artifices turned against himself. Among the Independents, who in general were hostile to all ecclesiastical systems, a set of men grew up called Levellers, who disallowed all subordination whatsoever, and declared that they would have no other chaplain, king, nor general, save Jesus Christ. All this would have gone down very well with Cromwell as long as it was only directed against his enemies, but he did not relish it quite so well when applied to himself. Accordingly, having intimation that the Levellers were to meet at a certain place, he unexpectedly appeared before them at the head of his red regiment, which had hitherto been deemed invincible, and demanding, in the name of God, what these meetings and murmurings meant, he expostulated with them upon the dangerous consequence of their precipitate schemes, and desired them immediately to depart. Instead of obeying, however, they returned an insolent answer; upon which he ordered his guards to disperse them, caused several of them to be hanged upon the spot, sent others to London, and thus dissipated a faction which was no otherwise criminal than in having followed his own example. Cromwell's authority was greatly increased by the reduction of this sect; and it became irresistible in consequence of a new and unexpected addition to his successes.

Reign of Charles I. Meanwhile the relative situations of parties had materially changed, and the power of the Independents been increased as that of the Presbyterians declined. The former, too, began to disclose ulterior views and intentions which had never hitherto been suspected by their allies the Scots, whom they now took all occasions to mortify. The latter also found, that in the matter of Presbytery, no less than in the conduct of the war and the policy pursued towards the king, they had been overreached and deceived. The discovery in question brought on an accommodation between Charles and his Scottish subjects, who, in consideration of his majesty agreeing to confirm the covenant in parliament, and establish the Presbyterian church till it should be revised by the assembly of divines, engaged to assert and restore his authority by force of arms. This treaty was afterwards called *The Engagement*; but although discontents had multiplied between the two kingdoms, it was found no easy matter to induce the nation to enter into the views of those by whom the engagement had been concluded. The Scottish royalists, under Traquair and Callender, were impatient for action; the moderate Presbyterians, under the Duke of Hamilton, wished to restore the king and the power of the English Presbyterians; the wild party, headed by Argyll, and seconded by the kirk, denounced the engagement as a deadly breach of the covenant, and deprecated hostilities with

Reign of Charles I. England. Amidst this division of party and opinion, new levies were raised for the invasion of England, and the chief command given to Hamilton, as David Leslie and the other officers could not act without the sanction of the church.

Langdale headed a separate body of royalists who had not taken the covenant, and both invaded the north of England. But though these two armies amounted to above twenty thousand men, Cromwell, at the head of eight thousand hardy veterans, feared not to give battle to the divided and undisciplined mass, conducted by an incapable leader. Attacking these bodies in succession, he routed and dispersed them, took Hamilton prisoner, and, following up the blow, soon entered Scotland. Of the whole Scottish force only a small body under Callender, who disdained to surrender, made their way back to Scotland. This overthrow was the signal for the High Presbyterian party to bestir themselves. New levies were indeed raised by the Earl of Lanark, Hamilton's brother; but these proved of no avail. The Earls of Argyll, Cassillis, and Eglington, at the head of the Presbyterians of the west country and the Highlands, marched to Edinburgh, and inviting Cromwell to the metropolis, conducted him thither in triumph, suppressed the engagement, and renewed the solemn league and covenant with England. This expedition of the Covenanters to Edinburgh, commonly called the Whigamores' Inroad, gave the finishing blow to the royal cause in Scotland at this time.

During these contentions the king, who was kept a prisoner at Carisbrooke Castle, continued to negotiate with the parliament for putting an end to the unspeakable calamities of the kingdom. And the parliament, on the other hand, saw no method of restraining the military, except to counterbalance it by the kingly power. Frequent proposals for an accommodation accordingly passed between the captive king and the Commons; but the great obstacle which had all along stood in the way still remained unshaken. This was the king's refusal to abolish Episcopacy, though he consented to alter the liturgy. However, the treaty was still carried on with vigour, and the parliament for the first time seemed in earnest to conclude their negotiations. But all was now too late. The victorious army, headed by Cromwell, advanced to Windsor, and with furious remonstrances began to demand vengeance on the king. The unhappy monarch had been lately sent in custody to that place; and from thence he was now conveyed to Hurst Castle in Hampshire, opposite to the Isle of Wight. The parliament in the meanwhile began to issue ordinances for a more effectual opposition to these military encroachments, when they were astonished by a message from Cromwell, intimating his intention of paying them a visit next day with his whole army, and at the same time ordering them to raise him £40,000 on the city of London.

The Commons, though destitute of all hopes of prevailing, had still the courage to resist, and to attempt in the face of the whole army to finish the treaty they had begun with the king. They had taken into consideration the whole of his concessions; and although they had formerly voted them unsatisfactory, they now renewed the consultation with great vigour. After a violent debate, which lasted three days, it was carried in the king's favour, by a majority of 129 against 83, that his concessions were a foundation for the houses to proceed upon in settling the affairs of the nation. This was the last attempt in his favour; for the next day Colonel Pride, at the head of two regiments, blockaded the house, and seizing in the passage forty-one members of the Presbyterian party, sent them to a low room belonging to the house, that passed by the denomination of *Hell*. Above

Reign of Charles I. a hundred and sixty members were excluded; and none were allowed to enter but the most furious and determined of the Independents, in all not exceeding sixty. This atrocious invasion of parliamentary rights commonly passed by the name of Pride's Purge, and the remaining members were called the Rump. The latter soon voted that the transactions of the house a few days before were entirely illegal, and that their general's conduct was just and necessary.

Nothing now remained to complete the career of the Rump but to put the king to death. In this assembly, composed of the most obscure citizens and officers of the army, a committee was appointed to bring in a charge against the king; and on their report a vote was carried, declaring it treason in a king to levy war against his parliament. It was therefore resolved that a high court of justice should be appointed, to try his majesty for this newly-invented treason. For form's sake they desired the concurrence of the few remaining Lords in the upper house; but there was virtue enough left in that body unanimously to reject the proposal. The Commons, however, were not to be stopped by so small an obstacle. They voted that the concurrence of the House of Lords was unnecessary, and that the people were the origin of all just power. And to add to their zeal, a woman of Herefordshire, illuminated by prophetic visions, desired admittance, and communicated a revelation which she pretended to have received from heaven. She assured them that their measures were consecrated from above, and ratified by the sanction of the Holy Ghost. This intelligence gave them great comfort, and much confirmed them in their present resolutions. Colonel Harrison, the son of a butcher, was commanded to conduct the king from Hurst Castle to Windsor, and from thence to London. His subjects, who crowded to see their fallen sovereign, were greatly affected at the change which appeared in his face and person. He had permitted his beard to grow, and his hair had become venerably gray, rather by the pressure of anxiety than by the hand of time; whilst the rest of his apparel bore the marks of misfortune and decay. He had long been attended by an old decrepid servant commonly called *Sir Philip Warwick*, who could only deplore his master's fate, without being able to revenge his cause. All the exterior symbols of sovereignty were now withdrawn, and his attendants had orders to serve him without ceremony. He could not, however, be persuaded that his adversaries would bring him to a formal trial; but he every moment expected to be dispatched by private assassination.

From the 6th to the 20th of January was spent in making preparations for this extraordinary trial. The court of justice consisted of a hundred and thirty-three persons named by the Commons; but of these about seventy only met upon the trial. The members were chiefly composed of officers of the army, most of them of very mean birth, together with some of the Lower House, and a few citizens of London. Bradshaw, a lawyer, was chosen president; Coke was appointed solicitor for the people of England; Dorislaus, Steele, and Aske, were named assistants. The court sat in Westminster Hall. When the king was brought forward before this court, he was conducted by the mace-bearer to a chair placed within the bar. Though long detained a prisoner, and now produced as a criminal, he still maintained the dignity of a king. The charge was then read by the solicitor, accusing him of having been the cause of all the bloodshed which had flowed since the commencement of the war; after which Bradshaw directing his discourse to Charles, told him that the court expected his answer. The king began his defence by declining the authority of the court. He represented, that having been engaged in treaty with his two houses of

Rep. of parliament, and having finished almost every article, he expected a different treatment from that which he had now received. He perceived, he said, no appearance of an upper house, which was necessary to constitute a just tribunal. He alleged that he was himself the king and fountain of law, and consequently could not be tried by laws to which he had never given his assent; that having been intrusted with the liberties of the people, he would not now betray them by recognising a power founded in usurpation; that he was willing, before a proper tribunal, to enter into the particulars of his defence; but that until then he must decline any apology for his innocence, lest he should be considered as the betrayer of, and not as a martyr for, the constitution. Bradshaw, in order to support the authority of the court, insisted that they had received their authority from the people, the source of all right. He pressed the king not to decline the authority of the court which was delegated by the Commons of England, and interrupted, overruled, and browbeat him in his attempts to reply. In this manner the king was three times produced before the court, and as often persisted in declining its jurisdiction. The fourth and last time he was brought before this self-created tribunal, he was insulted on his way thither by the soldiers and the mob, who cried out, "Justice! justice! Execution! execution!" but he continued undaunted. His judges now examined some witnesses, by whom it was proved that the king had appeared in arms against the forces commissioned by parliament, and then pronounced sentence against him. He seemed very anxious at this time to be admitted to a conference with the two houses, and it was supposed that he intended to resign the crown in favour of his son; but the court refused compliance, and considered his request as an artifice to delay justice.

The behaviour of Charles throughout this trying scene was manly, firm, and dignified. In leaving the hall, the soldiers and rabble were again instigated to cry out Justice, and Execution, and to revile him with the most bitter reproaches; and, amongst other insults, one miscreant presumed to spit in his face. He patiently bore their insolence. "Poor souls," said he, "they would treat their generals in the same manner for sixpence." Those of the populace who still retained the feelings of humanity expressed their sorrow in sighs and tears. A soldier more compassionate than the rest could not help imploring a blessing on his royal head. An officer overhearing him, struck the honest sentinel to the ground before the king, who could not help saying that the punishment exceeded the offence.

On his return to Whitehall, Charles desired permission of the house to see his children, and to be attended in his private devotions by Dr Juxon, late bishop of London. These requests were granted, and three days were also allowed him to prepare for execution. Every night between his sentence and execution the king slept soundly as usual, though the noise of the workmen employed in erecting the scaffold continually resounded in his ears. The fatal morning having at last arrived, Charles rose early; and calling one of his attendants, bade him employ more than usual care in dressing him, and preparing him for so great a solemnity. The street before Whitehall was the place destined for his execution; for it was intended in this way to increase the severity of his punishment. He was led through the banquetting house to the scaffold adjoining to that edifice, attended by his friend and servant Bishop Juxon, a man of the same mild and steady character as his master. The scaffold, covered with black, was guarded by a regiment of soldiers under the command of Colonel Tomlinson; and on it were to be seen the block, the axe, and two executioners in masks. The people, in crowds, stood at a distance. The king sur-

veyed all these solemn preparations with composure; and, as he could not expect to be heard by the people at a distance, he addressed himself to the few persons who stood round him. He there justified his own innocence in the late fatal wars, observing that he had not taken arms till after the parliament had shown him the example; and that he had no other object in his warlike preparations, than to preserve that authority entire which had been transmitted to him by his ancestors. But, though innocent towards his people, he acknowledged the equity of his execution in the eyes of his Maker, and owned that he was justly punished for having consented to the execution of an unjust sentence against the Earl of Strafford. He forgave all his enemies; exhorted the people to return to their obedience, and acknowledge his son as his successor; and signified his attachment to the Protestant religion as professed by the church of England. So strong was the impression made by his dying words on those who could hear him, that Colonel Tomlinson himself, to whose care he had been committed, acknowledged himself a convert. At one blow his head was severed from his body. The other executioner then, holding up the head, exclaimed, "This is the head of a traitor."

It is impossible to describe the grief, indignation, and astonishment, which took place, not only among the spectators, who were overwhelmed with a flood of sorrow, but throughout the whole nation, as soon as the report of this execution was conveyed to them. Each blamed himself, either with active disloyalty to the king, or a passive compliance with his destroyers. The very pulpits which used to resound with insolence and sedition were now bedewed with tears of repentance; and all united in their detestation of those dark hypocrites, who, to satisfy their own enmity, involved a whole nation in the guilt of this catastrophe. Charles was executed on the 30th of January 1649, in the forty-ninth year of his age, and twenty-fourth of his reign. He was of a middling stature, robust, and well-proportioned. His countenance was pleasant, but melancholy; and it is probable that the continual troubles in which he was involved might have given this expression to his features. As it had been remarked that the king, the moment before he stretched out his neck to the executioner, had addressed to Juxon, with a very earnest accent, the single word "*Remember*," great mysteries were supposed to be concealed under that word; and the generals vehemently insisted with the prelate that he should inform them of the king's meaning. Juxon told them that the king, having frequently charged him to inculcate on his son the forgiveness of his murderers, had taken this opportunity, in the last moment of his life, when his commands, he supposed, would be regarded as sacred and inviolable, to reiterate that desire; and that his mild spirit thus terminated its earthly course by an act of benevolence to his greatest enemies.

methods of raising money.—Another Parliament called.—The Crown offered to Cromwell.—Refused.—Situation to which he was reduced by the frequent conspiracies of the Royalists and the Levellers.—His death and character.—Richard Cromwell declared Protector.—His abdication.—Rump Parliament reinstated.—Dissolved by the army.—Military Government.—Proceedings of Monk.—Negotiations.—March to London.—His quarters established in Westminster.—City of London punished.—Secluded Members of Parliament recalled.—New Parliament assembled.—Charles II. leaves Spain.—His message to the Parliament.—He is recalled, and lands in England.—Character of Monk's proceedings in the matter of the Restoration.

The dissolution of the monarchy followed, as a natural consequence, the execution of the king. At the commencement of the struggle the demands of the two houses were limited to the redress of existing grievances; but now when it was over, the triumphant party refused to be content with any thing less than the abolition of the old, and the establishment of a new and more popular form of government. They had sinned too deeply against royalty to trust themselves to the mercy or moderation of a king. A republic was therefore their choice, first, because it promised to shelter them from the vengeance of their enemies; and, secondly, because it offered them the additional advantage of sharing among themselves all the power, the patronage, and the emoluments of office. In accordance with this decision, the head of the king had no sooner fallen on the scaffold at Whitehall, than a proclamation was issued, declaring it treason to give to any person the title of king without the authority of parliament; and at the same time was published the vote of the 4th of January (1649), by which it had been decreed that the supreme authority in the nation resided in the representatives of the people. The peers, though aware of their approaching fate, met on the day fixed at their adjournment, and proceeded to business; but after a pause of a few days the Commons voted that the House of Lords, as useless and dangerous, ought to be abolished; and they declared it high treason to acknowledge Charles Stuart, son of the late king, as successor to the throne. A council of state was next appointed, consisting of forty-one members, with powers limited in duration to twelve months, and charged with the preservation of domestic tranquillity, the disposal of the military and naval force, the superintendence of internal and external trade, and the negotiation of treaties with foreign powers. A new great seal was then made, on one side of which were engraved the arms of England and Ireland, with this inscription, "The great seal of England;" and on the reverse was represented the House of Commons sitting, with this motto,—“On the first year of freedom, by God's blessing restored, 1649.” The forms of all public business were changed, and instead of proceeding in the king's name, ran in that of the “keepers of the liberties of England.” The Court of King's Bench was called the Court of Public Bench; and so cautious on this head, it is said, were some of the republicans, that, in reciting the Lord's prayer, they would not say, “thy kingdom,” but “thy commonwealth, come.” The king's statue in the exchange was thrown down; and on the pedestal these words were inscribed, *Exit tyrannus, regum ultimus*, “The tyrant is gone, the last of the kings.” The merit or demerit of thus erecting a commonwealth on the ruins of the monarchy belongs chiefly to Cromwell, Ireton, Bradshaw, and Marten, who by their superior influence guided and controlled the opinions and passions of their associates in the senate and the army.

The Commons next proceeded to punish those who had been most remarkable for their attachment to their late sovereign. The Duke of Hamilton, Lord Capel, and the Earl of Holland, were condemned and executed; the Earl

of Norwich and Sir John Owen were also condemned, and afterwards pardoned. These executions greatly irritated the Scots; and the insolence of the Independents, with their victories, inflaming them still more, they determined to acknowledge Prince Charles as their king, but at the same time to abridge his power by limitations similar to those which they had attempted to impose upon his father. But as Argyll and the more rigid Covenanters still predominated, they made their loyalty conditional on his own good behaviour. The first propositions were made to Charles at Paris, where he had passed some time in hopes of obtaining assistance; and renewed offers were made to him at Breda, to which place he had withdrawn on finding France indisposed to lend him any aid. But as he had by this time commanded Montrose to attempt a descent in his favour upon Scotland by force of arms, he, with the characteristic duplicity of his race, protracted the negotiations until the result of this enterprise should be known. With arms and money furnished by Sweden and Denmark, and accompanied by about six hundred Germans, Montrose, accordingly, arrived in Orkney from Hamburg, and by a compulsory levy of the islanders, raised his force to fourteen hundred men. He then passed over to the mainland of Scotland, where the people, remembering his former cruelties, fled in horror before him. But his career was destined to be a short one. Having advanced beyond the pass of Invercarron, his motley band was surprised by a superior force, surrounded, beaten, and dispersed. Montrose contrived to effect his escape, but having thrown himself on the protection of Macleod of Assynt, he was betrayed by that worthy for a thousand bolis of meal, and being brought prisoner to Edinburgh, he was condemned on his former attainder to be hanged for the space of three hours on a gibbet thirty feet in height, and his limbs were ordered to be stuck up in the principal towns of the kingdom; his head on a spike in Edinburgh, his arms on the gates of Perth or Stirling, his legs on those of Glasgow and Aberdeen, and his body to be interred by the hangman in Boroughmuir, unless the sentence of excommunication by the kirk were previously relaxed. Montrose's defeat and death, however, were productive only of a further limitation of the terms offered to Charles; and as he no longer refused to accept these conditions, and to take the covenant, if required to do so, he embarked with his court in a Dutch fleet, and arrived at the mouth of the Spey. But as the jealousy of the Scots had been roused by the late invasion, the covenant was exacted from him before he was suffered to land. His English attendants, with the exception of a few complying persons, who accommodated themselves to the times, were dismissed; and he was surrounded by the fanatical clergymen, who, though they approached his person in the most respectful manner, launched out in continual invectives on the iniquity of his father's house, the idolatry of his mother, and his own connection with inveterate malignants. Charles pretended to listen to their discourses, but nevertheless made an attempt to escape. Being overtaken, however, and brought back, he owned the greatness of his fault, and testified his repentance for what he had done.

Cromwell, in the mean time, having been appointed by the parliament to command the army in Ireland, prosecuted the war in that kingdom with his usual success. He had to encounter the royalists commanded by the Duke of Ormond, and the native Irish led on by O'Neale. But he quickly overcame their force; and most of the towns, intimidated by his energy, opened their gates at his approach. He was on the point of reducing the whole kingdom, when he was recalled by the parliament to defend his country against the Scots, who had raised a considerable army in support of the royal cause.

Common-
wealth.

As Fairfax had conscientiously declined to draw his sword against the Presbyterians of Scotland, Cromwell received the command of the forces destined to invade that kingdom, and, in a month from the time of the king's arrival, he was on the banks of the Tweed at the head of sixteen thousand veteran troops. Argyll, then at the head of the committee of estates, made the most vigorous preparations for his reception; while Leslie, who had never yet been beaten, opposed his great experience and cool sagacity to the genius of Cromwell. The latter, having established between Edinburgh and Leith a fortified camp, as a secure rallying point, wasted the Merse and the Lothians, in order to deprive Cromwell of subsistence; and when forced at length to retire within his entrenchments, he remained resolutely on the defensive, in spite of every expedient tried by his adversary to draw him out to action. At this time the king arrived at the Scottish headquarters, but his presence having excited the jealousy of the clergy, they ordered him to leave it, and forthwith proceeded to purge the camp of four thousand Malignants and Engagers, the only soldiers of credit and experience in the army; so that being now a host of saints, they concluded, somewhat hastily, that they could not be beaten. In the blindness of their folly, they murmured at their prudent general; and, in the extravagance of their fanaticism, they expostulated with the Lord in prayer on the urgent necessity of his interposition, in order to uphold the kirk, and deliver them from the sectaries. An opportunity of striking a blow to advantage having presented itself on a Sunday, Leslie proposed instantly to attack; but he was prevented by these insane fanatics, who affected great horror at the crime of Sabbath-breaking. Meanwhile Cromwell, straitened for provisions, withdrew his army, now reduced in numbers by sickness, to Dunbar. Leslie followed his movement, and encamped on the heights which command the town, taking care at the same time to occupy the passes by which alone the enemy could retire to Berwick. Cromwell's situation had become now most critical. His adversary's position was too strong to be assaulted with any hope of success; his retreat was intercepted; his provisions were nearly exhausted; sickness was daily thinning his ranks; destruction brooded over him. But the madness of the clergy restored the ascendancy of this extraordinary man's fortune, and snatched from Leslie the fruits of his masterly combinations, when he was on the very eve of reaping them in a bloodless harvest of victory. They had been wrestling with the Lord in prayer, as they termed it, and pretending some special revelation, they now fancied that they had obtained the victory, and that the heretical army, together with Agag their general, would forthwith be delivered into their hands. These holy idiots, accordingly, forced their general to descend to the plain, and to attack the English. When Cromwell discovered through his glass that the Scots were actually in motion, he exclaimed, "They are coming down; the Lord hath delivered them into our hands." His anticipation was speedily realised. Descending from the hills during a tempestuous night, which had extinguished their matches, the Scots, consisting entirely of raw undisciplined levies, were overthrown at the first onset by the veteran troops of Cromwell, who had been carefully sheltered from the storm; three thousand were slain, nine hundred made prisoners, and the remainder dispersed, whilst the loss of the English scarcely exceeded forty men.

This disaster, so richly merited, showed, in a striking point of view, the danger of disunion. In a meeting held at Perth, the Scottish parliament accordingly resolved to call in the aid of the Malignants and Engagers, on condition of repentance of past errors; but two of the western

Common-
wealth.

shires still held out against this approximation of parties, and withdrew from the general levy about five thousand men. Charles had by this time become thoroughly satisfied that soothing the religious prejudices of the kirk was indispensable to give him a chance of acquiring due preponderance in the state. On the first of January 1651, his coronation was performed with great solemnity at Scone. There, on his bended knees, and with his arm upraised, he swore by the Eternal and Almighty God to observe strictly the two covenants; to establish the Presbyterian government in Scotland and in his own family; to give his assent to acts for establishing it in his other dominions; to rule according to the law of God, and the venerated laws of the land; to abolish and withstand all false religions; and to root out heretics and enemies to the true God, when convicted as such by the kirk. Argyll then placed the crown upon the king's head, an act for which his own was afterwards the forfeit; and having seated him on the throne, both nobility and gentry swore allegiance, "according to the national covenant, and the solemn league and covenant."

In the meanwhile Cromwell was making rapid progress in subduing the kingdom. He had obtained possession of Edinburgh Castle, taken Tantallon by storm, attempted Dumbarton, though without success, and carried many places of inferior note. A severe attack of ague for a time retarded his operations; but in the month of July he marched with his army towards Stirling. The Scots faced him in their entrenched camp at Torwood, and resolved to pursue the same cautious conduct observed by Leslie till it had been so fatally overruled by the clergy. After observing them for a time, Cromwell withdrew to Glasgow, and the Scots took up a position at Kilsyth: he retrograded to Falkirk, and his opponents returned to their camp at Torwood. Both parties had now resumed the respective positions which they had originally occupied; but the aspect of affairs had materially changed. Whilst the attention of the Scots was engaged by the enemy in their front, a body of men had crossed the Frith in boats, and, having fortified a hill near Inverkeithing, were immediately followed by Lambert at the head of a powerful division. Holburn was dispatched from the camp at Torwood, with orders to drive the enemy into the sea; but being suddenly charged by Lambert at the head of a superior force, he was routed and put to flight. Cromwell then transported his army to the left bank of the river, and advanced on the rear of the Scots, who, in consequence, retired from the position which had thus been completely turned. The progress of the English excited the most fearful anticipations in the minds of the Scottish leaders; to Charles it suggested the execution of a project which he had long meditated, namely, to march into England, accompanied by such of his subjects of Scotland as were willing to share in the toils and perils of the enterprise. This scheme was opposed by Argyll and a few other chieftains, who regarded it as utterly desperate; but the king was inflexible; and the rest having expressed their readiness to stake their lives on the issue of the attempt, twelve thousand men began their march from Stirling, in the direction of Carlisle, and gained three days in advance before the movement was discovered.

Cromwell was surprised and embarrassed: he had not calculated on such a daring adventure, and his army was unprepared to follow at a moment's notice. But exerting all the energies of his powerful mind, he quickly assembled a large force, more formidable even for its quality than its numerical strength, and set out in quest of the fugitive invaders, who had met with none of the support upon which they had so confidently reckoned, either from the English royalists or Presbyterians. At last the Scot-

Commonwealth.

tish army, which had thrown itself into Worcester, was attacked by Cromwell at the head of thirty thousand men, and, after a desperate contest, completely defeated. The battle was fought on the 3d of September 1651, the day on which, twelve months before, the English general had defeated the Scots at Dunbar. In the morning, Fleetwood, who had advanced from Upton to Powick, received orders to force the passage of the Team; whilst Cromwell, in order to preserve his communications, threw a bridge of boats across the Severn at Bunshill, near the confluence of the two rivers. The operations necessarily occupied a considerable time, and at one o'clock in the afternoon the attack was not fully developed. About this time, while Charles with his staff was reconnoitring the positions of the enemy from the tower of the cathedral, a fire of musketry was heard in the direction of Powick. He descended immediately, and riding to the scene of action, ordered Montgomery with a brigade of horse and foot to defend the line of the Team, and oppose the construction of the bridge. But it was now too late. After a hard struggle Fleetwood effected a passage, at the moment when Cromwell, having completed the bridge, moved four regiments to his assistance. The Scots, though attacked by superior numbers, made a gallant resistance, disputing every field and hedge, repeatedly charging with the pike, and struggling to protract the contest in the hope of preventing Fleetwood from effecting a junction with Cromwell. Meanwhile the latter having secured the communication across the river, directed a battery to open upon Fort Royal, a work lately raised to cover the Sidbury gate of the town, and, under cover of its fire, moved his troops in two divisions to Perrywood and Redhill. With great promptitude Charles immediately marched the whole of his disposable infantry, the Duke of Hamilton's troops of horse, and some volunteers, to attack one of these divisions, while the other was still separated from it by the Severn; and fortune smiled on his first efforts. The English militia recoiled from the shock, and some guns were taken by the royalists. But Cromwell had placed in reserve some veteran battalions, who soon restored the battle, and forced the royalists to retreat in their turn. Still they remained unbroken; availing themselves of every advantage of ground to check the advance of the enemy, and anxiously expecting the arrival of the cavalry under Leslie, which had remained in the city. Leslie, however, did not appear till it was too late. The infantry, overpowered by superior numbers, were now flying in confusion to the gate protected by the fort. The battle was irretrievably lost. Disorder everywhere prevailed. The enemy assaulted the town on all sides, and, after an unavailing struggle in the streets, completed the victory by the capture of the place, and the annihilation of the whole royalist force.

The king, who had greatly signalled his personal courage during the battle, now entered upon a scene of adventures the most romantic that can be imagined. After cutting off his hair, the better to disguise his person, he worked for some days in the habit of a peasant, making faggots in a wood. He next attempted to retire into Wales, under the conduct of one Pendrel, a poor farmer, who was sincerely attached to his cause; but in this attempt he failed, as every pass was guarded to prevent his escape. Being obliged to return, he met one Careless, who had escaped the carnage at Worcester; and in his company the king was obliged to climb a spreading oak, among the branches of which they lay concealed during the day, while the soldiers of the enemy were heard in pursuit of them below. After this he experienced all the varieties of famine, fatigue, and pain, till he arrived at the house of Colonel Lane, a zealous royalist, in Staffordshire. Here

he deliberated about the means of escaping into France; and Bristol being supposed the most suitable port, it was resolved that he should ride thither before this gentleman's sister, on a visit to a person who lived in the neighbourhood of that city. During this journey the king every day met with persons whose faces he knew, and at one time passed through a whole regiment of the enemy's army. But on finding that, for a month to come, no ship would sail from Bristol either for France or Spain, he was obliged to go elsewhere for a passage. He therefore repaired to the house of Colonel Wyndham in Dorsetshire, where he was cordially received; and thence pursuing his journey to the sea-side, he once more had a narrow escape at an inn, where he tarried for the night. The day had been appointed for a solemn fast; and a weaver, who had been a soldier in the parliamentary army, was preaching against the king in a little chapel fronting the house. To avoid suspicion, Charles was himself among the audience. But it happened that a smith, of the same principles with the weaver, had been examining the horses belonging to the passengers, and came to assure the preacher that he knew by the fashion of the shoes that one of the strangers' horses came from the north. The preacher immediately affirmed that this horse could belong to no other than Charles Stuart, and instantly went with a constable to search the inn. But the king had taken timely precautions, and left the inn before the constable's arrival. At Shoreham, in Sussex, a vessel was at last found, in which he embarked. He was known to so many, that if he had not set sail at that critical moment, it would have been impossible for him to escape. After forty-one days' concealment he arrived safely at Feschamp in Normandy. No fewer than forty persons of both sexes had at different times been privy to his escape, although a reward of a thousand pounds was offered for his person.

In the mean time Cromwell returned in triumph, leaving Ludlow to improve the victory; and his first care was to depress the Scots, on account of their having "withstood the work of the gospel," as he called it. An act was passed for abolishing royalty in Scotland, and annexing that kingdom as a province to the English commonwealth. It was, however, permitted to send some members to the English parliament; judges were appointed to distribute justice; and the people of that country, now freed from the tyranny of the ecclesiastics, were not much dissatisfied with the government.

All parts of the British dominions being now reduced to perfect subjection to the parliament, they next resolved to chastise the Dutch, who had given some cause for complaint. It happened that Dorislaus, one of the late king's judges, being sent by the parliament as their envoy to Holland, was assassinated by one of the royal party who had taken refuge there; and some time after, Mr St John, appointed their ambassador to that court, was insulted by the friends of the Prince of Orange. These were judged sufficient grounds for a declaration of war against Holland by the commonwealth of England. The parliament's chief dependence lay in the activity and courage of Blake their admiral, who, although he had not entered the navy till late in life, yet surpassed all who went before him in courage and skill. On the other side, the Dutch opposed to him Van Tromp, justly celebrated for his bold and enterprising genius. Many engagements took place between these renowned commanders with various success; but these fierce encounters served rather to show the excellency of the admirals than to determine their superiority. At last the Dutch, who experienced many disadvantages by the loss of their trade, and by the total suspension of their fisheries, were willing to treat of a peace. The parliament, however, gave an evasive answer, and studied to

Common-wealth. keep their navy on foot as long as they could; rightly judging, that while the force of the nation was exerted by sea, it would diminish the formidable power of Cromwell by land.

But this remarkable man quickly perceived their designs, and, secure in the attachment of the army, resolved to seize the sovereign power. He persuaded the officers to present a petition for payment of arrears and redress of grievances. His orders were obeyed. A petition was drawn up and presented, in which the officers, after demanding their arrears, desired the parliament to consider how many years they had sat, and what professions they had formerly made of their intention to new-model the house, and establish freedom upon the broadest basis. They alleged, that it was now full time to give place to others; that, however meritorious their actions might have been, yet the rest of the nation had some right, in their turn, to manifest their patriotism in defence of their country. The house was highly offended, and appointed a committee to prepare an act, declaring that all persons who presented such petitions for the future should be deemed guilty of high treason. Against this the officers warmly remonstrated, and the parliament as angrily replied. Cromwell, informed of the altercation, started up in the utmost seeming fury, and turning to Major Vernon, cried out "that he was compelled to do a thing that made the very hair of his head stand on end." Then hastening to the house at the head of three hundred soldiers, and with marks of violent indignation on his countenance, he entered, took his place, and attended to the debates for some time. But when the question was about to be put, he suddenly started up, and, after some general remarks, began to load the parliament with the bitterest reproaches for their tyranny, ambition, oppression, and robbery of the public. Having finished his harangue, he stamped with his foot on the ground, which was the preconcerted signal for the soldiers to enter; and the place was immediately filled with armed men. He then turned, and again addressing himself to the members, said, "For shame, get you gone; give place to honest men, those who will more faithfully discharge their trust. You are no longer a parliament; I tell you, you are no longer a parliament; the Lord has done with you." Sir Harry Vane exclaiming against this conduct, "Sir Harry," cried Cromwell with a loud voice, "O Sir Harry Vane; the Lord deliver me from Sir Harry Vane." Then taking hold of one of the members by his cloak, he exclaimed, "Thou art a whoremaster;" to another he said, "Thou art an adulterer;" to a third, "Thou art a drunkard;" to a fourth, "Thou art a glutton;" and afterwards selecting different members in succession, he described them as dishonest and corrupt livers, a shame and scandal to the profession of the gospel. Suddenly checking himself, however, he turned to the guard and ordered them to clear the house. At these words Colonel Harrison took the Speaker by the hands and led him from the chair; Algernon Sidney was next compelled to quit his seat; and the other members, eighty in number, on the approach of the military, rose and moved towards the door. Cromwell now resumed his discourse. "It is you," he exclaimed, "that have forced me to do this. I have sought the Lord both day and night, that he would rather slay me than put me on the doing of this work." Then pointing to the mace, "Take away that fool's bauble," cried he; after which he cleared the hall, ordered the doors to be locked, and putting the keys in his pocket, returned to Whitehall. In the afternoon the members of the council of state assembled at their usual place of meeting. As Bradshaw took the chair, however, the lord-general entered and told them, that if they were there as private individuals they were welcome,

Common-wealth. but if as the council of state, they must know that the parliament was dissolved, and with it also the council. "Sir," replied Bradshaw, with the spirit of an ancient Roman, "we have heard what you did at the house this morning, and before many hours all England shall know it. But, sir, you are mistaken in thinking that the parliament is dissolved. No power under heaven can dissolve them but themselves. Therefore take you notice of that." After this protest they withdrew. But the decisive blow had been struck. By the parricidal hands of its own children perished the long parliament, which, under a variety of forms, had for more than twelve years defended and invaded the liberties of the nation. It fell without a struggle, unpitied and unregretted. The members slunk away to their homes, where, by submission, they sought to purchase the forbearance of their new master; while their partisans, if such they had, reserved themselves in silence for the day of retribution, which, however, came not until after Cromwell slept in his grave.

The whole civil and military power of the state now centred in Cromwell, who, by this bold transaction, became, in effect, king of Great Britain, with uncontrollable authority. Desirous, however, to amuse the people with the form of a commonwealth, he proposed to give his subjects a parliament, but such a one as should be altogether obedient to his commands. For this purpose it was decreed that the sovereign power should be vested in a hundred and forty-four persons, under the denomination of a parliament; and the lord-general undertook to select them himself. The persons pitched upon were the lowest, meanest, and most ignorant of the citizens, and the very dregs of the fanatics. To go farther than others in the absurdities of fanaticism was the chief qualification upon which each of these valued himself. Their very names, borrowed from scripture, and rendered ridiculous by their misapplication, served to show their excess of folly. One of them particularly, a canting leather-seller, called Praise-God-Barebone, gave his name to this odd assembly, which was called Barebone's Parliament. They were principally composed of Antinomians, a sect which, after receiving the spirit, supposed themselves incapable of error, and fifth-monarchy men, who every hour expected Christ's second coming on earth. They began by choosing eight of their number to seek the Lord in prayer, while the rest calmly sat down to deliberate upon the suppression of the clergy, the universities, and courts of justice; and besides all this, it was their intention to substitute the law of Moses in the room of the law of the land.

It was impossible such a legislature as this could stand; even the vulgar exclaimed against it, and Cromwell himself began to be ashamed of its absurdities. He had carefully chosen many persons among the members who were entirely devoted to his interests, and these he commanded to dismiss the assembly. They accordingly met by concert earlier than the rest of their fraternity; and observing to each other that this parliament had sat long enough, they hastened to Cromwell, with Rouse, their Speaker, at their head, and into his hands resigned the authority with which he had invested them. Cromwell accepted their resignation with pleasure; but being told that some of their number showed themselves refractory, he sent Colonel White to clear the house of such as ventured to remain there. They had placed one Moyer in the chair by the time the colonel arrived; and he being asked by the colonel what they did there, replied very gravely, "That they were seeking the Lord." "Then you may go elsewhere," rejoined Colonel White, "for, to my certain knowledge, the Lord hath not been here these many years."

This shadow of a parliament being thus dissolved, the

Common-
wealth.

officers, by their own authority, declared Cromwell protector of the Commonwealth of England. The mayor and aldermen were sent for to give solemnity to his appointment, and he was installed into his new office at Whitehall, in the palace of the kings of England. He was to be addressed by the title of Highness; and his power was proclaimed in London, and in other parts of the kingdom. It was now, indeed, in a great measure necessary that some person should take the supreme command; for affairs had been brought into such a situation, by the furious animosities of the contending parties, that nothing short of absolute power could prevent a renewal of bloodshed and confusion. The government of the kingdom was adjusted in the following manner. A council was appointed, which was not to exceed twenty-one, nor fall below thirteen persons, who were to enjoy their offices for life, or during good behaviour; and, in case of a vacancy, the remaining members were to name three, of whom the protector was to choose one. The protector was appointed the supreme magistrate of the Commonwealth, with powers such as the king was formerly possessed of. The power of the sword was vested in him jointly with the parliament when sitting, or with the council at other times. He was obliged to summon a parliament once every three years, and to allow them to sit five months without adjournment. The standing army was fixed at twenty thousand foot and ten thousand horse, and funds were assigned for their support. The protector was to enjoy his office for life, and on his death his place was to be supplied by the council. Of all these clauses, that in regard to the standing army was alone sufficient for Cromwell's purpose; for, while possessed of that instrument, he could at any time mould the rest of the constitution to his pleasure. He chose his council from among his officers, who had been the companions of his dangers and victories, and to each of them he assigned a pension of a thousand pounds a year. He took care to have his troops, upon whose fidelity he depended for support, paid a month in advance. The magazines were also well provided, and the public treasure was managed with frugality and attention; whilst by his activity, vigilance, and resolution, he discovered every conspiracy against his person, and every plot for an insurrection, before they took effect.

Thus Cromwell continued to govern, though without assuming the title of king, in as absolute a manner as the most despotic prince in Europe. As he was feared at home, so he made himself respected abroad. The Dutch, humbled by repeated defeats, were obliged to sue for peace; to consent to pay deference to the British flag; to abandon the interests of the king; to pay £85,000 as an indemnification for former expenses; and to restore to the English East India Company a part of those dominions which they had been dispossessed of by the Dutch during the former reign. The ministry of France thought proper to pay court to the protector; and as he had furnished that court with a body of six thousand men to attack the Spanish dominions in the Netherlands, the French put Dunkirk into his hands as a reward for his attachment. By means of the fleet under Blake he humbled Spain and chastised the Algerines and Tunisians. Penn and Venables, two other admirals, made an attempt on the island of Hispaniola; but failing in this, they steered to Jamaica, which was surrendered to them without a blow. Yet so little was thought of this conquest at the time, that, on their return, the two admirals were committed to the Tower, by reason of the failure of the principal object of their expedition.

It is not to be supposed that a numerous standing army could be maintained, and so many foreign wars carried on, without incurring extraordinary expenses. In fact, the

protector's revenues were so much exhausted, that he was obliged to have recourse to methods which he probably would not have chosen had he not been driven to them by necessity. One or two royalist conspiracies, though detected and punished, served him as a pretext for imposing a tax upon that party, of the tenth penny on all their possessions; and in order to raise this oppressive impost, ten major-generals were instituted, who divided the whole kingdom into as many military jurisdictions. They had power to subject whom they pleased to this tax, and to imprison such as denied their jurisdiction. Under colour of these powers they exercised the most arbitrary authority; the people had no protection against their exactions; the very mask of liberty was entirely thrown off; and all property was placed at the disposal of a military tribunal. It was in vain that the nation cried out for a free parliament. Cromwell assembled one in consequence of their clamours, but as speedily dissolved it when he found it refractory to his commands. At last, as parliaments were always held in such estimation by the people, he resolved to give them one, but such as should be entirely of his own choosing, and chiefly composed of his creatures. Lest any of a different description should enter the house, guards were placed at the doors, and none admitted but such as produced a warrant from his council.

The principal design of convening this assembly was to offer him the crown, with the title of king, and all the other ensigns of royalty. His creatures, therefore, took care to insinuate the confusion which existed in legal proceedings without the name of a king; that no man was acquainted with the extent or limits of the authority of the present magistrates; but that those of a king had been well ascertained by the experience of ages. The motion was at last formally made in the house, easily carried through, and nothing seemed now wanting but Cromwell's own consent to have his name enrolled among those of the kings of England. This consent, however, he had not resolution enough to give. His doubts continued for some days; and the conference carried on with the members who had made him the offer, as far as it is intelligible on his part, seems to argue that he was desirous of being compelled to accept the offer. The conference, however, terminated in his total refusal.

But with all these proffered honours, and with all his despotic power, the situation of Cromwell was far from being enviable. Perhaps no situation, however mean or contemptible, was more truly distressing than his, even at the time when the nation was loading him with congratulations and addresses. He had at last rendered himself hateful to every party, and he owed his safety solely to their mutual hatred and distrust. His arts of dissimulation were exhausted; none could be any longer deceived by them; and even those of his own party and principles disdained the use to which he had converted his zeal and professions. Though the whole nation silently detested his administration, he would not have been completely wretched if he could have found domestic consolation. But even his own family had embraced republican principles with so much vehemence, that they could not without indignation behold him invested with uncontrolled power; and even Mrs Claypole, his favourite daughter, upbraided him, on her death-bed, with all the crimes by which he had waded "through slaughter to a throne." To aggravate all this, conspiracies were formed against him; and it was at last openly taught, that his death was not only desirable, but that his assassination would be meritorious. A book was published by one Colonel Titus, a man who had formerly been attached to his cause, entitled "Killing no Murder." Of all the pamphlets which appeared at that time, or which have since been published,

Common-
wealth.

Common-wealth. this was one of the most masterly. Cromwell read it, and is said never to have smiled afterwards.

The protector now found, that the grandeur to which he had sacrificed his former tranquillity was only an inlet to fresh inquietudes. He was haunted with perpetual apprehensions of assassination. He wore armour under his clothes, and always kept pistols in his pockets. His aspect was clouded by a settled gloom, and he regarded every stranger with suspicion. He was always attended by a numerous guard, and generally travelled in a hurry. He never returned from any place by the road he went; and never slept above three nights together in the same chamber. At last, however, he was delivered from this life of horror and anxiety by a tertian ague, of which he died on the 3d of September 1658, after having held the reins of government nine years.¹

"Till the commencement of the present century," says Dr Lingard, "when that wonderful man arose who, by the splendour of his victories and the extent of his empire, cast all preceding adventurers into the shade, the name of Cromwell stood without a parallel in the history of civilized Europe. Men looked with a feeling of awe on the fortunate individual who, without the aid of birth, wealth, or connections, was able to seize the government of three powerful kingdoms, and to impose the yoke of servitude on the necks of the very men who had fought in his company to emancipate themselves from the less arbitrary sway of their hereditary sovereigns. That he who accomplished this was no ordinary person, all must admit; and yet, on close investigation, we shall discover little that was sublime or dazzling in his character. Cromwell was not the meteor which surprises and astounds by the brilliancy and rapidity of its course. Cool, cautious, calculating, he stole on with slow and measured pace, and, while with secret pleasure he toiled up the ascent to greatness, laboured to persuade the spectators that he was reluctantly borne forward by an exterior and resistless force, by the march of events, the necessities of the state, the will of the army, and even the decree of the Almighty. He looked upon dissimulation as the perfection of human wisdom, and made it the key-stone of the arch on which he built his fortunes. The aspirations of his ambition were concealed under the pretence of attachment to the 'good old cause,' and his secret workings to acquire the sovereignty for himself and his family were represented as endeavours to secure for his former brethren in arms the blessings of civil and religious freedom, the two great objects which originally called them into the field. Thus his whole conduct was made up of artifice and deceit. He laid his plans long beforehand; he studied the views and dispositions of all from whose influence he had anything to hope or to fear; and he employed every expedient to win their affections, and to make them the blind unconscious tools of his policy. For this purpose he asked questions, or threw out insinuations in their hearing; now kept them aloof with an air of reserve and dignity; now put them off their guard by condescension, perhaps by buffoonery; at one time addressed himself to their vanity or avarice, at another exposed to them with tears (for tears he had at will) the calamities of the nation; and then, when he found them moulded to his purpose, instead of assenting to the advice which he had himself suggested, feigned reluctance, urged objections, and pleaded scruples of con-

science. At length he yielded; but it was not till he had acquired by his resistance the praise of moderation, and the right of attributing his acquiescence to their impotency rather than to his own ambition.

"Exposed as he was to the continual machinations of the royalists and levellers, both equally eager to precipitate him from the height to which he had attained, Cromwell made it his great object to secure to himself the attachment of the army. To it he owed the acquisition, through it alone could he insure the permanence, of his power. Now, fortunately for his purpose, that army, composed as never was army before or since, revered in the lord-protector what it valued mostly in itself, the cant and practice of religious enthusiasm." "In minds thus disposed, it was not difficult to create a persuasion that the final triumph of 'their cause' depended on the authority of the general under whom they had conquered; while the full enjoyment of that religious freedom which they so highly prized rendered them less jealous of the arbitrary power which he occasionally assumed. In his public speeches he perpetually reminded them, that if religion was not the original cause of the late civil war, 'yet God soon brought it to that issue;' that amidst the strife of battle, and the difficulties and dangers of war, the reward to which they looked was freedom of conscience; that this freedom to its full extent they enjoyed under his government, though they could never obtain it till they placed the supreme power in his hands. The merit which he thus arrogated to himself was admitted to be his due by the great body of the saints: it became the spell by which he rendered them blind to his ambition and obedient to his will; the engine by which he raised, and afterwards secured, the fabric of his power.

"On the subject of civil freedom the protector could not assume so bold a tone. He acknowledged, indeed, its importance; it was second only to religious freedom: but if second, then, in the event of competition, it ought to yield to the first. He contended that under his government every provision had been made for the preservation of the rights of individuals, as far as was consistent with the safety of the whole nation. He had reformed the chancery, he had laboured to abolish the abuses of the law, he had placed learned and upright judges on the bench, and he had been careful in all ordinary cases that impartial justice should be administered between the parties. This was indeed true; but it was also true that by his orders men were arrested and committed without lawful cause; that juries were packed; that prisoners, acquitted at their trial, were sent into confinement beyond the jurisdiction of the courts; that taxes had been raised without the authority of parliament; that a most unconstitutional tribunal, the high court of justice, had been established; and that the major-generals had been invested with powers the most arbitrary and oppressive.

"Some writers have maintained that Cromwell dissembled in religion as well as in politics; and that when he condescended to act the part of the saint, he assumed for interested purposes a character which he otherwise despised. But this supposition is contradicted by the uniform tenor of his life. Long before he turned his attention to the disputes between the king and the parliament, religious enthusiasm had made a deep impression on his mind; it continually manifested itself during his long career both

¹ The night on which Cromwell died was stormy. "The violence of the wind increased till it blew a hurricane. Trees were torn from their roots in the park, and houses unroofed in the city. So strange a coincidence could not fail of exciting remarks in a superstitious age; and though the storm reached to the coasts of the Mediterranean, in England it was universally referred to the death of the protector. His friends asserted that God would not remove so great a man from the world without previously warning the nation of its approaching loss; the cavaliers more maliciously maintained that the devils, 'the princes of the air, were congregating over Whitehall, that they might pounce on the protector's soul.'" (Lingard, *History of England*, vol. vii. p. 273. London, 1829, 4to.)

Common-wealth.

in the senate and the field; and it was strikingly displayed in his speeches and prayers on the last evening of his life. It should, however, be observed, that he made religion harmonize with ambition.¹

Oliver Cromwell was succeeded in his office of protector by his son Richard, who immediately called a parliament. To this assembly the army presented a remonstrance, desiring to have some person appointed for their general in whom they could confide. But the house voted such meetings and remonstrances unlawful; upon which the officers, surrounding Richard's house, forced him to dissolve the parliament; and he soon afterwards signed an abdication of the government. His younger brother Henry, who had been appointed to the command in Ireland, followed Richard's example, and resigned his commission without striking a blow.

The officers, thus left at liberty, resolved to restore the Rump Parliament, as it was called, consisting of that remnant of a parliament which had condemned Charles. But no sooner were they reinstated in authority, than they began to humble the army by cashiering some of the officers, and appointing in their room others on whom they could place more reliance. The officers, accordingly, resolved to dissolve the assembly. For this purpose Lambert, one of the general officers, drew together a chosen body of troops, and, placing them in the streets which led to Westminster Hall, when the Speaker, Lenthall, proceeded in his carriage to the house, he ordered the horses to be turned, and very civilly conducted him home. The other members were likewise intercepted; and the army returned to their quarters to observe a solemn fast, which generally either preceded or attended all their remarkable proceedings. A committee was then elected, of twenty-three persons, of whom seven were officers. These they invested with sovereign authority; and a military government was established, which gave the nation a prospect of endless servitude and tyranny without redress.

Upon learning that the officers had by their own authority dissolved the parliament, General Monk, who was then in Scotland with eight thousand veteran troops, protested against the measure, and resolved to defend the national privileges. As soon as he had put his army in motion, he found himself eagerly courted by all parties; but so cautious was he of declaring his mind, that, till the very last, no one knew which side he would take. As a remarkable instance of this politic or hesitating behaviour, when his own brother came to him with a message from Lord Granville in the name of the king, he refused all conversation with him upon hearing that he had told his errand to Mr Price, the general's own chaplain, and a man of known probity and honour.

Informed that the officers were preparing an army to oppose him, Monk amused them with negotiations; and the people, finding themselves not entirely defenceless, began to declare for a free parliament. The Rump, being invited by the navy and part of the army, again ventured to resume their seats, and to thunder votes in their turn against the officers and that party of the army by which they had been ejected. Without taking any notice of Lambert, they sent orders to the troops to repair immediately to the garrisons appointed for them. The soldiers obeyed; and Lambert at last found himself deserted by his whole army. Monk in the mean time proceeded with his army to London. The gentry, on his march, flocked round him with addresses, expressing their desire of a new parliament; but that general, still continuing his inflexible taciturnity, at last reached to St Alban's, within a few miles

of the capital, leaving all the world in doubt as to his motives and designs. Here he sent the parliament a message, desiring them to remove such forces as remained in London to country quarters. Some of the regiments willingly obeyed this order; and such as did not, Monk turned out by force; after which he took up his quarters in Westminster. The house voted him thanks for his services. He desired them to call a free parliament; and this soon inspired the citizens with courage to refuse submission to the present government. They resolved to pay no taxes until the members formerly excluded by Colonel Pride should be replaced. But for this they were punished by Monk, at the desire of the parliament. He arrested eleven of the most obnoxious of the common council; broke the gates and portcullises, and, having exposed London to the scorn and contempt of all who hated it, he returned in triumph to his quarters at Westminster. The next day, however, he made an apology for this conduct, and promised for the future to co-operate with the mayor and common-council in such schemes as they should approve.

The Commons were now greatly alarmed. They tried every method to detach the general from his new alliance; some of them even promised to invest him with the dignity of supreme magistrate, and to support his usurpation. But Monk was too cunning or too-wise to hearken to such proposals; he resolved to restore the secluded members, and by their means to bring about a new election. The restoration of the expelled members was easily effected; and their number was so much superior to that of the Rump, that the chiefs of this last party now withdrew in their turn. The restored members began with repealing all the orders by which they had been expelled. They renewed and enlarged the general's commission; fixed a proper stipend for the support of the fleet and army; and, having passed these votes, dissolved themselves, giving orders for the immediate assembling of a new parliament. Meanwhile Monk new-modelled his army to the purposes he had in view; and some officers, by his direction, presented him with an address, in which they promised to obey implicitly the orders of the ensuing parliament. He approved of this engagement, which he ordered to be signed by all the different regiments; and this furnished him with a pretence for dismissing all the officers by whom it was rejected.

In the midst of these transactions, Lambert, who had been confined in the Tower, escaped from prison, and began to raise forces; and as his activity and principles were sufficiently known, Monk took prompt measures to oppose his proceedings. He dispatched Colonel Ingoldsby, with his own regiment, against Lambert, before the latter had time to assemble his dependents. With four troops of horse Lambert had taken possession of Daventry; but the greater part of them having joined Ingoldsby, Lambert also surrendered, not without exhibiting strong marks of pusillanimity.

All this time Monk still persisted in his reserve; nor had he intrusted his secret intentions to any person except one Morris, a gentleman of Devonshire. The latter was of a sedentary and studious disposition; and with him alone had the general deliberated on the great and dangerous enterprise of the restoration. Sir John Granville, who had a commission from the king, applied for access to the general; but he was desired to communicate his business to Morris. Granville refused, though twice urged, to deliver his message to any but the general himself; upon which Monk, finding he could depend on this mi-

Common-wealth.

Corbon- nister's secrecy, opened to him his whole intentions, but, with his usual caution, refused to commit any thing to paper. In consequence of these overtures the king left the Spanish territories, but very narrowly escaped being detained at Breda by the governor, under pretence of treating him with proper respect and formality. From this he retired to Holland, where he resolved to wait the course of events.

The new parliament being assembled, Sir Harbottle Grimstone was chosen Speaker, a man known to be a royalist in his heart. The eyes of all were now turned towards the king; yet such were their fears, and such the dangers which attended freedom of speech, that for some days no one ventured to make any mention of his name. At length Monk gave directions to Annesley, president of the council, to inform them that one Sir John Granville, a servant of the king's, had been sent over by his majesty, and was now at the door with a letter to the House of Commons. After some manœuvring, this message was received, Granville was called in, the letter read, and the king's proposals accepted of. He offered a general amnesty to all persons whatsoever, and that without any other exceptions than should be made by parliament. He promised to indulge scrupulous consciences with liberty in matters of religion; to leave to the examination of parliament the claims of all such as possessed lands with contested titles; to confirm all these concessions by act of parliament; to satisfy the army under General Monk with respect to their arrears; and to give the same rank to his officers when they were enlisted in the king's army.

In consequence of this agreement between the king and the parliament, Montague, the English admiral, waited on Charles, to inform him that the fleet expected his orders at Scheveling. The Duke of York immediately went on board, and took the command as lord high admiral. The king embarked without delay, and landing at Dover, was received by Monk, whom he honoured with particular marks of attention. He entered London on the 29th of May 1660, which was his birth-day; and was attended by a great number of people, who testified their joy, as the multitude commonly do on such occasions, by loud acclamations.

"That the re-establishment of royalty was a blessing to the country," says Dr Lingard, "will hardly be denied. It presented the best, perhaps the only, means of restoring public tranquillity, amidst the confusion and distrust, the animosities and hatreds, the parties and interests, which had been generated by the civil war, and by a rapid succession of opposite and ephemeral governments. To Monk belongs the merit of having, by his foresight and caution, effected this desirable object without bloodshed or violence: but to his dispraise it must also be recorded, that he effected it without any previous stipulation on the part of the exiled monarch. Never had so fair an opportunity been offered of establishing a compact between the sovereign and the people, of determining by mutual consent the legal rights of the crown, and securing from future encroachment the freedom of the people. That Charles would have consented to such conditions, we have sufficient evidence; but when the measure was proposed, the lord-general declared himself its most determined opponent. It may have been that his cautious mind figured to itself danger in delay; it is more probable that he sought to give additional value to his services in the eyes of the new sovereign. But, whatever were the motives of his conduct, the result was, that the king ascended the throne unfettered with conditions, and thence inferred

that he was entitled to all the powers claimed by his father at the commencement of the civil war. In a few years the consequence became manifest. It was found that by the negligence or perfidy of Monk a door had been left open to the recurrence of dissension between the crown and the people; and that very circumstance which Charles had hailed as the consummation of his good fortune, served only to prepare the way for a second revolution, which ended in the permanent exclusion of his family from the government of these kingdoms."¹

REIGN OF CHARLES II.

Charles II.—His first measures popular.—The regicides punished.—Indignities offered to the remains of Cromwell, Ireton, and Bradshaw.—Death of the Duke of Gloucester.—Parliament dissolved.—State of the nation.—Profligacy and ingratitude of the King.—Slavish disposition of Parliament.—King's extravagance.—Marriage with the Infanta of Portugal.—War with the Dutch.—Naval engagements.—Action off Lowestoffe.—Battle of the Four Days.—Negociations.—The Dutch fleet appears in the Medway and the Thames.—Plague in London.—Great Fire.—Peace with Holland.—Clarendon disgraced.—The triple alliance.—Arbitrary proceedings of the King.—The Cabal.—Renewal of the war with Holland.—Desperate naval battle in Southwold Bay.—Successes of the French king against the Dutch.—Meeting of Parliament.—Test Act.—Bold procedure of the Commons.—National Discontents.—Popish Plot.—Impeachment of Danby.—Exclusion Bill brought in.—Duke of York returns to England.—Petitioners and Abhorers.—Whig and Tory.—Attempt to establish Episcopacy in Scotland.—Persecution of the Presbyterians.—Rising at Pentland.—Insurgents defeated.—Cruelties exercised by Archbishop Sharpe.—Act against Conventicles.—Scheme of Comprehension and Indulgence.—The King takes out lawburrows against his subjects.—Letters of Intercommuning.—Trial and execution of James Mitchell.—Infamous conduct of the Privy Council.—Murder of Archbishop Sharpe.—Second Insurrection.—Insurgents defeated at Botliwell Bridge.—Parliamentary proceedings.—Parliament dissolved, and a new one summoned to meet at Oxford.—Case of Fitzharris.—Parliament dissolved.—Arbitrary proceedings of the King.—Fitzharris condemned and executed.—Spies, informers, suborners, and plotters.—Bill of indictment against Shaftesbury ignored by the Grand Jury.—Affairs in Scotland.—Cameron and Cargill declare war on the government.—Skirmish at Airmoss.—Cargill excommunicates the King and the Ministers at Torwood.—Subsequent atrocities.—Insidious and diabolical proceeding of the Council.—Trial of the Earl of Argyll.—London deprived of its Charters.—Compositions entered into by other Corporations.—Designs against the King.—The Rye-house Plot.—Consequent proceedings.—Death of Charles II.—His character.

Charles II. was thirty years of age at the time of his restoration. Being naturally of an engaging countenance, and possessed of an open, affable disposition, he became a favourite with all classes of his subjects. They had now experienced all the miseries of anarchy, and in proportion to these was the satisfaction they felt on the accession of the young monarch. His first measures were also calculated to give general satisfaction. He seemed desirous of obliterating the memory of past animosities, and of uniting every party in affection for their prince and country. He admitted into his council the most eminent men of the nation, without regard to former distinctions. The Presbyterians shared this honour equally with the royalists. Calamy and Baxter, presbyterian clergymen, were even made chaplains to the king. Admiral Montague was created Earl of Sandwich, and General Monk Duke of Albemarle. Morris, the general's friend, was appointed secretary of state. The choice which the king at first made of his principal ministers and favourites, was, in like man-

¹ *History of England*, vol. vii. pp. 342, 343.

Reign of Charles II. ner, popular. Sir Edward Hyde, created Earl of Clarendon, was made prime minister and chancellor; the Marquis, created Duke of Ormond, was named steward of the household; the Earl of Southampton became high-treasurer; and Sir Edward Nicholas secretary of state. These men, united in the strictest bonds of friendship, supported each other's credit, and for a time steadily pursued the interests of the public.

The parliament having been summoned without the king's consent, received at first only the title of a Convention; and it was not until after an act had passed for that purpose that they were acknowledged by the name of a Parliament. Both houses acknowledged the guilt of the former rebellion, and gratefully received in their own name, and in that of all the subjects, his majesty's gracious pardon and indemnity. The king having before promised an indemnity to all criminals, excepting such as should be excluded by parliament, he now issued a proclamation, declaring, that such of the late king's judges as did not surrender themselves within fourteen days should receive no pardon. Nineteen surrendered themselves; some were taken in their flight; and others escaped beyond sea. The Peers seemed inclined to great severity on this occasion, but were restrained by the king, who, in terms apparently the most earnest, pressed the act of general indemnity.

After repeated solicitations, the act of indemnity passed both houses, with the exception of those who had an immediate hand in the king's death. Even Cromwell, Ireton, and Bradshaw, though dead, were considered as proper objects of resentment. Their bodies were dug from their graves, dragged to the place of execution, and, after hanging some time, buried under the gallows. Of the rest who had sat in judgment on the late monarch's trial, some were dead, and others thought worthy of pardon. Ten only out of eighty were doomed to immediate destruction. These were enthusiasts who had all along acted from principle, and who, in the general spirit of rage excited against them, showed a fortitude which would have done honour to any cause.

This was all the blood that was shed at the restoration. The rest of the king's judges were reprieved, and afterwards dispersed in several prisons. The army which had for so many years governed the nation was now disbanded, and prelacy, with all the ceremonies of the church of England, was at the same time restored; yet the king pretended to preserve the air of moderation and neutrality. In regard to religion, Charles, in his gayer hours, was a professed deist; but in the latter part of his life he showed an inclination to the Catholic persuasion, which he had strongly imbibed in his infancy and exile.

On the 13th of September this year died the young Duke of Gloucester, a prince of some promise. The king was never so deeply affected by any incident in his life. The Princess of Orange, also, having come to England, in order to share the joy attending the restoration of her family, with whom she lived in great friendship, soon afterwards sickened and died. The queen-mother paid a visit to her son, and obtained his consent to the marriage of the Princess Henrietta with the Duke of Orleans, brother to the French king. The parliament having met on the 6th of November, and carried on business with the greatest unanimity and dispatch, was dissolved by the king on the 29th of December 1660.

During the reign of Charles II. the spirit of the people seemed to take a turn quite opposite to that which it had exhibited in the time of his father. The latter found his subjects animated with a fierce though often ill-regulated zeal for liberty. They knew not what it was to be free, and therefore imagined that liberty consisted in throwing off entirely the royal authority. After a bloody and pro-

tracted struggle they carried their point; the unhappy Reign of monarch was dethroned and put to death; but instead of liberty they found themselves involved in the meshes of a more formidable tyranny than that which they had overthrown. From this, however, they were freed by the restoration; but they now ran into the contrary extreme; and instead of an unbounded spirit of opposition, there was nothing but an unbounded spirit of submission, through which Charles at length found means to render himself almost quite absolute, and to govern without requiring, or indeed without having any occasion for, parliaments. A similar revolution, or rather revulsion, took place in matters connected with religion. During the former reigns a spirit of the most gloomy enthusiasm had overspread the whole island, and men imagined that the Deity was only to be appeased by their denying themselves all social pleasure, and resisting every thing which tended to make life agreeable. The proceedings of Cromwell and his associates, to say nothing of the conduct of others, showed that this was not genuine religion; but, in avoiding one error, they ran into another equally dangerous. Every thing religious or serious was now discountenanced; riot and dissipation everywhere prevailed. The court set the example. Nothing but scenes of gallantry and festivity were to be seen; the horrors of the late war became the subject of ridicule; the formality of the sectaries was displayed on the stage, and even laughed at from the pulpit; in a word, the best mode in religion now was to have as little as possible, and, in deriding the hypocrisy of the sectaries, to transgress even the common duties of morality. In the midst of this riot and dissipation, the old and faithful followers of the royal family were left unrewarded. Numbers who had fought both for the king and his father, and had lost their whole fortunes in his service, were suffered to pine in want and oblivion; whilst their persecutors, who had acquired fortunes during the civil war, were permitted to enjoy them without molestation. The wretched royalists petitioned and murmured in vain. The monarch fled from their expostulations to scenes of mirth and festivity: and the act of indemnity was with some reason described as an act of forgiveness to the king's enemies, and of oblivion to his friends.

In 1661 the Scottish and English parliaments vied with each other in protestations of loyalty and attachment to the king. In England, monarchy and episcopacy were raised to the greatest splendour. The bishops were permitted to resume their seats in the House of Peers, and all military authority was acknowledged to be vested in the king. He was empowered to appoint commissioners for regulating corporations, and expelling such members as had intruded themselves by violence, or professed principles dangerous to the constitution. An act of uniformity was passed, by which it was required that every clergyman should be re-ordained, if he had not before received episcopal ordination; that he should declare his consent to every thing contained in the Book of Common Prayer, and should take the oath of canonical obedience. In consequence of this law, above two thousand of the presbyterian clergy resigned their cures at once. In Scotland the right of the king was asserted in the fullest and most positive terms to be hereditary, divine, and indefeasible. His power was extended to the lives and possessions of his subjects, and his original grant was held to be the source whence all that they enjoyed was derived. They voted him an additional revenue of £40,000; and all the former violences were spoken of in terms of the utmost detestation.

But this intoxication of loyalty soon began to wear off. The king's profusion and extravagance in his pleasures, together with his indolence in administration, furnished

of opportunities of making very disadvantageous comparisons between him and Oliver Cromwell. And these dispositions were increased by the ejection of so many ministers, and also by observing Dunkirk, which had been acquired during Cromwell's vigorous administration, sold to the French for L.40,000, and that merely to supply the king's extravagance. From this time, August 1662, Charles found himself perpetually opposed; and his parliaments granted supplies much more reluctantly than before.

A few months previously, the continual exigencies of the king had forced him to conclude a marriage with the Infanta of Portugal, for the sake of her portion, which was to be L.500,000 in money, together with the fortress of Tangier in Africa, and that of Bombay in the East Indies. The Lord Chancellor Clarendon, and the Dukes of Ormond and Southampton, urged many reasons against this match, particularly the likelihood of her never having any children; but all their objections were fruitless, and therefore Clarendon, like a true courtier, set himself to promote it as far as lay in his power. But the king's necessities being still greater than his supplies could meet, he resolved to sacrifice his minister, Clarendon, to the resentment of the parliament, to whom he had become obnoxious, in order to procure more money. In 1663 an extraordinary supply was demanded. On the 12th of June the king sent for the Commons to Whitehall; and having complained of their inattention, he informed them of a conspiracy which had been formed to seize the castle of Dublin, hoping by this means to furnish a reason for demanding a present supply. The artifice succeeded. Four subsidies were immediately granted, and the clergy in convocation followed the example of the Commons. On this occasion the Earl of Bristol ventured to impeach the Chancellor in the House of Peers; but as he did not support his charge, the affair was dropped for the present.

In 1664 Charles was induced to declare war against the Dutch, with the view, probably, of getting the money to be employed for that purpose into his own hands. In this war the English, under the command of Sir Robert Holmes, expelled the Dutch from Cape Coast Castle in Africa, and likewise seized on their settlements of Cape Verd and the Isle of Goree. Sailing thence to America, the admiral took possession of Nova Belgia, since called New York, and long afterwards a dependency of Britain. On the other hand, De Ruyter, the Dutch admiral, dispossessed the English of all their settlements in Guinea except Cape Coast. He afterwards sailed to America, where he attacked Barbadoes and Long Island, but was at last repulsed.

At length a battle between the grand fleets of each nation was fought near Lowestoffe on the 3d of June 1665, the one under the Duke of York, to the number of a hundred and fourteen sail; the other commanded by Opdam, admiral of the Dutch navy, of nearly equal force. The English fleet was divided into three squadrons; the red, under the command of the duke; the white, under that of Prince Rupert; and the blue, under the Earl of Sandwich. James hoisted his flag on board the Royal Charles. The Dutch fleet sailed in seven divisions, comprising one hundred and thirteen ships. The bravest and noblest of the Dutch youths had repaired on board to share the dangers of the expedition; and as the admiral had received positive orders to fight, every heart beat high with the hope of victory. But Opdam did not share this confidence. In the inexperience of many of his captains, and the insufficiency of their crews, this able seaman discovered enough to make him doubt the result of the coming battle; and to those near him he observed, "I know what prudence would suggest; but I must obey my orders, and by this time to-morrow you shall see me crown-

ed with laurel or with cypress." Early in the morning of the 3d the hostile fleets descried each other near Lowestoffe, and seven hours were spent in attempts on each side to gain the weather-gage. At length the English, tacking in the same direction as the enemy, soon pushed alongside of them, in a parallel line, upon which the signal was made for each ship to bear down and engage her opposite in the enemy's fleet. The sea was calm and the sky cloudless, but a slight breeze which blew from the south-west facilitated the execution of the duke's order. The two nations fought with their characteristic obstinacy, and during four hours the issue hung in suspense. On one occasion the duke was in imminent peril. All the ships of the red squadron except two had dropped out of the line to refit and prepare again for action, and the weight of the enemy's fire was poured into the flag-ship. The Earl of Falmouth, Lord Muskerry, and Boyle, son to the Earl of Burlington, were killed by the same shot, and James was bespattered with their blood. But the disabled ships gradually resumed their stations in the line; and as the fire of the English began to increase, that of the enemy was observed to slacken. At length the Eendracht, bearing Opdam's flag, blew up, and the admiral with five hundred men perished in the explosion. Dismayed at the loss of their commander, the Dutch fled in confusion. Four of their sternmost ships running foul of each other, were destroyed by a fire-ship, and three others shortly afterwards experienced the same fate. Van Tromp endeavoured to keep the fugitive ships together; and as the darkness of the night retarded pursuit, the Dutch fleet in the morning was moored in safety within the shallows. In this battle the enemy lost four admirals, seven thousand men slain or made prisoners, and eighteen sail either burnt or taken. The loss of the victors was small in proportion, not exceeding six hundred men.

This success excited the jealousy of the neighbouring states, particularly France and Denmark, who immediately resolved to protect the republic against such a formidable enemy. De Ruyter, the great Dutch admiral, on his return from Guinea, was appointed, at the head of seventy-six sail, to join the Duke of Beaufort, the admiral, who it was supposed was then entering the British channel from Toulon. The Duke of Albemarle (Monk) and Prince Rupert now commanded the British fleet, which did not exceed seventy-four sail. Albemarle detached Prince Rupert with twenty ships to oppose the Duke of Beaufort; a piece of rashness against which Sir George Ayscue protested in vain. The fleets thus engaged on most unequal terms, and the memorable battle of the Four Days ensued. The first day the Dutch admiral Evertzen was killed by a cannon-ball, one of their ships was blown up, and three of the English ships were taken; darkness parted the combatants. The second day the battle was renewed with incredible fury. Sixteen fresh ships joined the Dutch; and the English were so shattered that their fighting ships were reduced to twenty-eight. They retreated towards their own coast, followed by the Dutch; and another fierce conflict commenced, but was put a stop to by the darkness of the night. In the morning of the third day the English continued their retreat, and the Dutch their pursuit. Albemarle came to the desperate resolution of blowing up his own ship rather than submit to the enemy, when he found himself happily reinforced by Prince Rupert with his squadron of twenty sail. By this time, however, it was night; but the next day, being the fourth, the fleets came again to close action, which was continued with great fury till they were parted by a mist. Sir George Ayscue had the misfortune to strike on the Galoper Sand, where he was taken, with a ship, the Prince Royal, of a hundred guns. Both sides claim-

Reign of Charles II.

Reign of Charles II. ed the victory, but the Dutch certainly had the advantage in this engagement. A second, however, equally bloody, happened soon after, with larger fleets on both sides, but commanded by the same admirals. In this the Dutch were vanquished; but few prizes were made, and De Ruyter conducted his retreat in such a gallant and masterly manner, that he kept the pursuers at bay, and soon moored his fleet in safety within the Wierings.

This success brought on negotiations, which were protracted on various pretexts. The English exchequer was completely drained, and to prepare the fleet for sea again required an immediate supply of money. Parliament had indeed made a grant for the public service; but, though liberal in amount, it offered only a distant resource. In these circumstances it was, in an evil hour, proposed to lay up the larger ships in ordinary, and to equip two squadrons of light frigates for harassing the enemy's trade in the Channel and the German Ocean; and although the Duke of York stated that such a proceeding was in truth tantamount to an abandonment of the sovereignty of the sea, the difficulty of procuring money, and the expectation of a speedy peace, weighed so much with the king and council, as to obtain their consent to a measure which brought lasting disgrace on the government and the country. It was in fact disarming, and inviting attack. Nor did the enemies of England forego the opportunity which was thus offered. A secret treaty was on the eve of being concluded between that country and France; and four out of the seven United Provinces, desirous of peace, resolved to withdraw their contributions towards the expenses of the war. But the pensionary, De Witt, still thirsted for revenge. The Dutch fleet being ready for sea, whilst that of England was dismantled and in the docks, he determined not to throw away the opportunity which fortune had placed in his hands. The English argued, and the French remonstrated, but the pensionary continued inexorable. He left the Texel in company with De Ruyter, and ordered the fleet, to the amount of seventy, to join him in separate squadrons off the Nore. The English government was not taken altogether by surprise. The warnings of the Duke of York had awakened them to a sense of their danger; and three months before orders had been issued to strengthen the fortifications at Sheerness, to throw a boom across the Medway at the stakes, to mount guns on the batteries, and to prepare a number of fire-ships. But these orders were very ill executed. The commissioners of the navy were already a million in debt; their credit was gone; to procure ready money, either by application to the treasury, or by loan from the bankers, was impossible; and, without immediate payment, the sailors refused to serve, the labourers to work, and the merchants to sell. Little had therefore been done, and that little imperfectly. Meanwhile De Witt, in order to distract the attention of the government, ordered one division of his fleet to sail up the Thames as far as Gravesend, and the other to destroy the shipping in the Medway. The works at Sheerness opposed but a feeble resistance, and were levelled with the ground by a few broadsides. At the first alarm, Monk hastened to the mouth of the Medway, where he erected batteries, moored guard-ships for the protection of the boom, and sunk five ships before it in the narrowest part of the channel. He had scarcely completed these preparations, when the Dutch advanced with the wind and tide in their favour; but the obstructions in the main passage proved insurmountable; and they were forced to drop away with the ebb. In the night, however, they discovered another channel deep enough for large ships at high water, and in the morning worked their way through without impediment. The foremost ships then opened their

fire on the batteries, while a heavy fire-ship running against the boom, hung upon it, and a second following in her wake, it broke under their united pressure. The guard-ships were soon in a blaze, and the Royal Charles, a first-rate, became the prize of the assailants. Finding all his efforts here fruitless, Monk hastened back to Upnor Castle, and employed the night in mounting guns, collecting ammunition, and manning the batteries. Morning revealed a most humiliating spectacle, the Dutch fleet advancing triumphantly up the river. Two line-of-battle ships led the line; then came six enormous fire-ships; which, at a short distance, were followed by the rest of the squadron. The men of war anchored to receive and return the fire of the batteries on either bank; the fire-ships passed between them, and speedily set fire to the Royal James, the Oak, and the London, three first-rates. Indescribable consternation reigned in the capital. It was fully expected that the Dutch would sail up next tide to London Bridge, destroy the whole shipping, and reduce the metropolis to a heap of ruins. At the ebb, however, their commander, Van Ghent, made the signal to the fleet to fall down the river, and having burnt two of his vessels which had grounded, he rejoined the other division at the Nore. The disgrace which had thus been inflicted on England, so lately mistress of the seas, sunk deep in the hearts of the people. Unable to conceive how the Dutch, whom they had so often defeated, should ride triumphant in their rivers, burn their ships, and fill with dismay the capital and the country, their grief and indignation knew no bounds; and whilst many attributed the calamity to the imaginary machinations of the Catholics, others believed that the king had secretly leagued with the enemy to depress the nation, that he might the more easily establish a despotic government.

During these transactions London was desolated by one of the most calamitous visitations ever experienced by this or any other nation. In the winter of 1664, two or three isolated cases of plague had occurred in the outskirts of the metropolis, and excited general alarm; but it was not till about the end of May 1665, that, under the malignant influence of excessive heat, and a close, stagnant atmosphere, the evil burst forth in all its terrors. From the centre of St Giles the infection spread with rapidity over the adjacent parishes, threatened the court at Whitehall, and, in spite of every precaution, crept into the city. A general panic ensued. The nobility and gentry fled; the royal family followed; and all who had the power or the means prepared to imitate their example. By every outlet the tide of emigration flowed towards the country, till it was checked by the lord mayor refusing to grant certificates of health, and by the opposition of the neighbouring townships, which rose in their own defence, and drove back the fugitives into the devoted city. The absence of the wealthier class of citizens, and the consequent breaking up of establishments, with the cessation of trade, served to aggravate the calamity; and although the charity of the opulent seemed to keep pace with the progress of the pestilence, forty thousand servants were left without a home, and the number of artisans and labourers thrown out of employment was still more considerable. The mortality was at first confined to the lower classes, carrying off a larger proportion of children than of adults, and of females than males; but, by the end of June, its diffusion became so rapid, its virulence so great, and its ravages so destructive, that the civil authorities, in virtue of the powers with which they had been invested by an act of James I. "for the charitable relief and ordering of persons infected with the plague," divided the parishes into districts, allotting to each a competent number of officers; and ordered a red cross, one foot in length, to be

sign of painted on the door of every infected house, with the words "Lord have mercy on us" placed above it, that the healthy might be warned of the existence of the disease. Provision was also made for the interment of the dead. In the day-time persons were always on the watch to withdraw from public view the bodies of those who expired in the street; during the night the tinkling of a bell, accompanied with the lurid glare of torches, announced the approach of the pest-cart making its melancholy round to receive the victims of the previous twenty-four hours. "No coffins were prepared; no funeral service was read; no mourners were permitted to follow the remains of their relatives and friends. The cart proceeded to the nearest cemetery, and shot its burden into the common grave, a deep and spacious pit, capable of holding some scores of bodies, and dug in the church-yard, or, when the church-yard was full, in the outskirts of the parish."

The distemper generally manifested itself by the febrile symptoms of shivering, nausea, headach, and delirium; but in some these affections were so mild as to be mistaken for a slight and transient indisposition. The insidious approaches of the mortal foe were not discovered, and the patient applied to his usual avocations, till suddenly faintness seized him, the fatal "tokens" or plague-spots appeared on his breast, and then his hour was come. In most cases, however, the pain and delirium left no room for doubt. The sufferings of the patients were dreadful, and often threw them into paroxysms of frenzy, during which they burst the bands that confined them to their beds, precipitated themselves from the windows, ran naked into the street, and plunged into the river. If the patient survived till the third or fourth day, buboes appeared, and when these could be made to suppurate recovery might be anticipated; but if the efforts of nature and the physician proved unavailing, death became inevitable. Men of the strongest minds were lost in amazement when they contemplated the woe and desolation wrought by the pestilence; the timid and credulous became the dupes of their own imaginations and the victims of their own terrors; whilst fanaticism scattered abroad its wild predictions and fierce denunciations to add to the inexpressible horror of the scene. During the months of July and August, when the weather was sultry and the heat oppressive, the eastern parishes, which had at first been spared, became the chief seat of the pestilence, and the substantial citizens suffered in common with their poorer neighbours. The regulations of the magistrates could now no longer be enforced. The nights were insufficient for the burial of the dead; coffins were borne along the street at all hours of the day; and the poor burst from their infected dwellings to seek relief for their families, who were perishing of famine as well as of the pestilence. "London," says Dr Lingard, in a passage worthy of Thucydides, "presented a wide and heart-rending scene of misery and desolation. Rows of houses stood tenantless and open to the winds; others, in almost equal numbers, exhibited the red cross flaming on the doors. The chief thoroughfares, so lately trodden by the feet of thousands, were overgrown with grass. The few individuals who ventured abroad walked in the middle, and, when they met, declined on opposite sides, to avoid the contact of each other. But if the solitude and stillness of the streets impressed the mind with awe, there was something yet more appalling in the sounds which occasionally burst upon the ear. At one moment were heard the ravings of delirium or the wail of woe from the infected dwelling; at another the merry song or the loud and careless laugh from the was-sailers at the tavern or the inmates of the brothel. Men became so familiarised with the form, that they steeled their feelings against the terrors, of death. They waited

each for his turn with the resignation of the Christian or the indifference of the Stoic. Some devoted themselves to the exercises of piety; others sought relief in the riot of dissipation or the recklessness of despair."

In September the heat of the atmosphere abated; but, contrary to expectation, the mortality increased. From this time infection became the certain harbinger of death, which followed often within the space of twenty-four hours, generally in the course of three days. An experiment, grounded on the practice of former times, was now ordered to be tried. Fires of sea-coal, in the proportion of one to every twelve houses, were kindled in the streets, courts, and alleys of London and Westminster, and were kept burning three days and nights, till a heavy, continuous rain extinguished them. By the supposed disinfecting power of heat, it was hoped to dissipate the pestilential miasm, or at least to abate its virulence; and, in fact, the next report exhibited a considerable diminution in the number of deaths. But whilst the survivors were congratulating themselves on the prospect of deliverance, the destroying angel was scattering a fiercer pestilence from his wings. In the following week, ten thousand victims sank under the accumulated virulence of the disease, and despair reigned in every heart. Yet even now, in this lowest depth of human misery, deliverance was at hand. The high winds which usually accompany the autumnal equinox cooled and purified the air; the fever assumed a less malignant form; the weekly number of deaths successively decreased; in the beginning of December seventy-three parishes were pronounced clear of the disease; and in February the court, attended by the nobility and gentry, returned to Whitehall. Upwards of a hundred thousand individuals are said to have perished in London alone; and as the pestilence extended its destructive sway over the greater part of the kingdom, the fugitives from the metropolis carrying the infection with them wherever they found an asylum, the total amount of its ravages must have been truly dreadful.

This calamity was followed by another, if possible, still more dreadful. On the night of Sunday the 2d of September 1666, a fire broke out in Pudding Lane, near Fish Street, one of the most crowded quarters of the metropolis. It originated in a bakehouse; the buildings in the neighbourhood being constructed of wood, with pitched roofs, quickly caught the flames; and the stores with which they were filled consisting of the highly combustible articles used in the equipment of shipping, nourished the conflagration. The pipes from the new river were found empty, and the engine which raised water from the Thames was consumed. No decisive measures were adopted to check the progress of the devouring element, and several hours elapsed before the aid of the military was called for. Meanwhile the wind, which during the day blew from the east, augmented hourly in violence, and became a perfect hurricane. The fire spread with astonishing velocity, leaping as it were from roof to roof, and frequently igniting houses at a distance; "the night was as light as day for ten miles round;" a vast column or pillar of fire, about a mile in diameter, ascended to the clouds; the flames, as they rose, were bent, broken, and shivered, by the fury of the tempest; and every blast scattered through the air flakes of fire, which, falling on inflammable materials, kindled new conflagrations. The lurid red glare of the sky, the scorching heat of the atmosphere, the roaring of the flames, and the frequent crash of falling buildings, combined to fill every breast with astonishment and terror. While the storm raged, the conflagration bade defiance to every effort of human ingenuity or power. Houses had been blown up or demolished, and gaps thus made, in hopes of arresting the progress of the flames; but ignited flakes

Reign of
Charles II.

were carried over the empty space, or the ruins again took fire, or the flames unexpectedly turned in a new direction. On the evening of Wednesday the violence of the wind began to abate; and the church of the Temple, as well as Westminster Abbey and Whitehall, were saved by the destruction of the neighbouring buildings. Towards the evening of Thursday the weather became calm, and hopes were entertained that this dreadful calamity was approaching its close. But in the night new alarms were excited. The fire burst out again in the Temple, while it still raged with unabated fury near Cripplegate, and a large body of flame seemed to be making rapid advances towards the Tower. With the aid of gunpowder, however, large openings were made; and as the weather continued calm, the conflagration was thus prevented from extending its ravages, and, in consequence, gradually died out, although months elapsed before the combustion was altogether extinguished in the immense accumulation of ruins. By this deplorable calamity two thirds of London, including the whole space from the Tower to the Temple, were reduced to ashes. The number of houses consumed amounted to thirteen thousand two hundred, and that of churches, including St Paul's, to eighty-nine, covering three hundred and seventy-three acres within, and sixty-three without the walls.

The history of this fire accounts sufficiently for its origin, as well as for the destructive ravages it committed. But at this time political and religious prejudices had perverted the understandings by inflaming the passions of men, and every occurrence was viewed through a false and distorting medium. By some it was considered as an evident visitation of Providence in punishment of sin: but the precise nature of the sin was not agreed upon; the more rigid religionists declaring it to consist in the immorality of the king and the courtiers, whilst the cavaliers were equally positive that nothing but the guilt of the late rebellion could have entailed such a chastisement on the nation. Others, again, attributed it to the disloyalty and revenge, either of the republicans, who sought to destroy the seat of the monarchy, or of the Catholics, who wished to punish the stronghold of Protestant heresy. Of these charges, however, no vestige of proof could ever be discovered; and in the report of the House of Commons, which is still extant, will be found a complete refutation of the calumny. But the men of that time were not to be reasoned out of what they had determined at all hazards to believe; and accordingly, on the monument erected to perpetuate this calamitous event, stands recorded the calumnious falsehood, that "the burning of this Protestant city was begun and carried on by the treachery and malice of the Popish faction." Next to the guilt of him who perpetrates an atrocious crime, says Dr Lingard, is the guilt of those who charge it upon the innocent. One good, however, resulted from this great evil. The plague was fairly burnt out, and the city rose like a phoenix from its ashes; the streets being widened, the narrow and unwholesome alleys totally banished, and the houses built of brick instead of wood. In so frightful a devastation, it is remarkable that not a single life was lost.

These complicated misfortunes did not fail to excite many murmurs among the people. Whilst the blame of the fire was laid on the Papists, the Dutch war was exclaimed against as unsuccessful and unnecessary, and as an attempt to humble that nation, who were equally enemies to Popery with themselves. Charles himself also began to be sensible, that all the ends for which he had undertaken this war were likely to be entirely frustrated. Instead of being able to lay up money for his own purposes, the supplies of parliament had hitherto been so scanty, that he found himself considerably in debt. A treaty was

therefore set on foot, and concluded at Breda on the 21st of July 1667. By this treaty the only advantage gained by Britain was, the cession of the colony of New York. It was therefore accounted disgraceful by the nation, and the blame of it thrown upon the Earl of Clarendon, who, besides, was charged with the sale of Dunkirk, the bad payment of the seamen, the disgrace inflicted by the Dutch fleet, and his own ambition. His daughter, whilst yet in Paris, had countenanced the addresses of the Duke of York, and, under a solemn promise of marriage, had admitted him to the privileges of a husband. James, however, either of his own accord, or through the persuasions of his brother Charles, afterwards married her; and this was imputed as a crime to Clarendon. On these grounds the king, who had never much loved this nobleman, ordered the seals to be taken from him and given to Sir Orlando Bridgeman. Clarendon was again impeached; and though the charges were manifestly frivolous, yet so strong was the popular torrent against him, that he thought proper to withdraw into France. Soon after, Charles formed an alliance with Holland and Sweden, in order to prevent the French king from completing his conquest of the Netherlands, the greatest part of which he had already subdued; and he was unexpectedly stopped in his career by this league, in which it was agreed by the contracting powers to constitute themselves arbiters of the differences between France and Spain, and to check the exorbitant pretensions of both.

The king now began to govern in a very arbitrary manner. He had long wished to extend his prerogative, and to be able to furnish himself with whatever sums he wanted for his pleasures, and he therefore sought ministers who would make no scruple of gratifying him in both particulars. In Clifford, Ashley (afterwards Shaftesbury), Buckingham, Arlington, and Lauderdale, who were distinguished by the term *Cabal*, a word formed from the initials of their names; he found a junta in all respects suited to his wishes. These men, it is probable, were as ready to betray their king as they speedily showed themselves to betray their country; yet it seems pretty evident that they were deceived by their master, who concealed from them the real state of his degrading connection with France, and also the secret of what he was pleased jocosely to denominate his religion. The first effects of the advice given by the Cabal were a secret alliance with France, and a rupture with Holland. The undivided disgrace of both transactions belongs to them, notwithstanding the king had taken a bribe from France, which, however, he kept from the knowledge of his ministers, lest they should claim their share in the wages of infamy. Soon after this the Duke of York declared himself a Catholic; and liberty of conscience was proclaimed to all sectaries, Dissenters as well as Catholics. A proclamation was also issued containing very rigorous clauses in favour of impressment; and at the heels of this came another full of menaces against those who should speak undutifully of his majesty's measures; nay, even against those who heard such discourses, unless they informed in due time against the offenders. These things gave great and just offence to the people; but they were especially alarmed at the alliance with France, and afraid of the perfidy by which the policy of that nation was characterized.

In the meanwhile the Dutch, attacked by Louis on land, and by the combined navies of England and France on sea, and at the same time deserted by their ally Sweden, seemed on the very verge of destruction. But the republic of the United Provinces was not wanting to itself in this crisis. War was declared with Holland on the 17th of March 1672; and by the beginning of May the

Reign of
Charles II.

Reign of Charles II. of Dutch fleet put to sea. It consisted of seventy-five men of war, and a considerable number of fire-ships, with which De Ruyter stationed himself between Dover and Calais, to prevent the intended junction of the French and English fleets. The Duke of York lay at the Nore with forty sail, being all he was able to muster; but with this force he contrived, under cover of a fog, to pass the enemy unnoticed, and to reach St Helens, where he awaited the arrival of the French squadron under D'Estrées. When the latter had joined, the combined fleet immediately sailed in quest of the enemy. He was discovered lying off Ostend, but prudently declined to engage even upon equal terms; and baffling all the manœuvres employed to bring him to action, at last reached Goree. The duke then returned to Southwold Bay, in order that his ships might take in their full complement of men and provisions, in both of which they had previously been deficient. Meanwhile De Ruyter, learning the situation and employment of the English, suddenly resolved to become the aggressor; and sailing from Goree with his whole force on the evening of the 27th May, he would probably have surprised his enemies at anchor, had it not been for Cogolin, the captain of a French frigate, who, ignorant of the coast, had anchored during the night at a distance of several miles from Southwold Bay, and having descried two of the Dutch ships in the morning, fired off his guns in succession as a signal of the approach of the enemy. Still the bold and decided advance of De Ruyter had all the effect of a surprise. James, it is true, immediately ordered every ship to get under weigh, and take her station in the line; but the wind being easterly, and the tide running to leeward, not more than twenty sail could form to meet the enemy. The duke, with part of the red squadron, encountered De Ruyter and the fleet from the Maas; the Earl of Sandwich led the blue against Van Ghent and the fleet from Amsterdam; whilst D'Estrées opposed Banker with the ships from Zealand, though, probably from respect for conservative principles, the French commander cautiously avoided coming to close action with his opponent. The battle raged long and fiercely. The English had to contend with a bold, skilful, and experienced enemy, and, owing to the inexplicable inactivity of their French allies, no less than to the suddenness of the attack, they had to make head against a fearful disparity of force. Their ships, becoming intermingled with those of the enemy, could afford each other little support, whilst they were in imminent danger of being overwhelmed by the number of their adversaries. Still they fought with desperate courage, in order to protract their resistance till they could be joined by the remainder of the fleet from the bay. About eleven o'clock the flag-ship, the *Prince*, of one hundred guns, lay a complete wreck on the water, having lost all her rigging and above one third of her crew. Finding her no longer manageable, the duke ordered her to be towed out of the fire, and immediately shifted his flag to the *St Michael* of ninety guns. The gallant Earl of Sandwich was less fortunate. In his ship the *Royal James*, a first-rate, he had repeatedly beat off the enemies by whom he was surrounded; carried by boarding a seventy-gun ship which lay athwart his hawse; and sunk a fire-ship which was drifting towards him. But after a contest of eight hours' duration, the *Royal James* became unmanageable; a second fire-ship now grappled her on the larboard side; and in a few minutes that magnificent vessel was in flames. The duke ordered the *Dartmouth* and a number of boats to hasten to her assistance, and between two and three hundred of the crew were saved; the rest, with their gallant commander, perished in the waves. Meanwhile the other ships joined the fleet, and the combat became more equal. About five the duke shifted his flag from the *St*

Michael, which could with difficulty be kept afloat, to the London, which had sustained less damage, and the battle continued with unabated fury. But, about seven o'clock, De Ruyter shrunk from the conflict, and sailed to overtake the Zealand squadron. The honour of the victory belonged to the English. With all the disadvantages of a surprise, and with wind and tide against them, they encountered a force greatly superior, and, notwithstanding the skill of the Dutch admiral and the bravery of his men, they maintained the combat with that cool determined courage which, when properly directed, nothing under heaven can overcome, and ultimately compelled the enemy to retreat. The English lost one, and the Dutch three ships of the line; but the French suffered very little, not having entered into the heat of the engagement. It was even supposed by some that they had orders to observe this conduct, and to spare their own ships, whilst the Dutch and English weakened each other by their mutual fury in the combat.

The combined powers were more successful against the Dutch by land. Louis carried all before him, crossed the Rhine, took the frontier towns of the enemy, and threatened the new republic with dissolution. Terms were proposed to them by the conquerors. Louis offered them such as would have deprived them of all power of resisting an invasion from France by land; those of Charles would have exposed them equally to invasion by sea. At last the murmurs of the English at seeing this brave and industrious people, the supporters of the Protestant cause, totally sunk and on the brink of destruction, were too loud not to reach the king. He was obliged to call together the Parliament in order to take the sense of the nation respecting his conduct; and he soon found how his subjects stood affected towards him.

The parliament met on the 24th of February 1673. They began with resisting some of the king's extraordinary stretches of prerogative, and taking means for promoting uniformity in religious matters. A law was passed entitled the Test Act, imposing an oath on all who should enjoy any public benefice. Besides taking the oaths of allegiance and supremacy, such persons were obliged to receive the sacrament once a year in the established church, and to abjure all belief in the doctrine of transubstantiation. As the Dissenters also had seconded the efforts of the Commons against the king's declaration of indulgence to Roman Catholics, a bill was passed for their ease and relief, which, however, met with some difficulty in passing through the Peers. The Dutch, in the mean time, continued to defend themselves with such valour, that the Commons began to despair of success. They therefore resolved that the standing army was a grievance; and declared that they would grant no more supplies to carry on the Dutch war, unless it appeared that the enemy were so obstinate as to refuse all reasonable conditions. To cut short these disagreeable altercations, the king resolved to prorogue the parliament; and with that intention he went unexpectedly to the House of Peers, and sent the usher of the black rod to summon the House of Commons to attend. The usher and the Speaker happened to meet nearly at the door of the house; but the Speaker being within, some of the members suddenly shut the door, and cried, "To the chair." It was then moved, and voted by acclamation, that the alliance with France was a grievance, that the evil counsellors of the king were a grievance, and that the Earl of Lauderdale was a grievance; upon which the house rose in great confusion. The king finding that he could expect no supply from the Commons for carrying on a war so unpopular, resolved to make a separate peace with the Dutch, on the terms which they had proposed through the Spanish ambassador; and

Reign of Charles II.

Reign of Charles II. having asked the advice of his parliament, a peace was concluded accordingly.

The prepossession which Charles had all along shown in favour of France, and his manifest inclination upon all occasions to attach himself to that kingdom, had given great offence to his people; and other circumstances also conspired to raise a general discontent. The toleration of Catholics, so much wished for by the king, and the bigotry of the Duke of York, the heir-apparent to the crown, who was zealous for the propagation of the Catholic religion, excited an alarm, not altogether without foundation, that the Protestant religion was in danger. But these fears and discontents were carefully fomented by wicked and designing men, who, to promote their own interests, scrupled not to advance the greatest falsehoods. In 1678 an account of a plot, supposed to have been formed by the Papists, for burning London, putting the Protestants to death, and destroying the king and the Protestant religion, was circulated by one Kirby, a chemist; Tong, a weak, credulous parson; and Titus Oates, who had likewise been a clergyman, and was in reality one of the most abandoned miscreants that ever disgraced humanity. The circumstances attending this pretended discovery were so perfectly incredible and monstrous, that it seems amazing how any person of common sense could give ear to them; yet so violently were the minds of the nation at this time inflamed against the Catholics, that it not only produced the destruction of many individuals of the Romish persuasion, but a general massacre of that unfortunate sect was apprehended. The parliament, who ought to have repressed these delusions, and brought back the people to calm deliberate inquiry, showed themselves even more credulous than the vulgar themselves. The cry of the plot was immediately echoed from one house to the other; the country party could not let slip so favourable an opportunity of managing the passions of the people; and the courtiers were afraid of being thought disloyal if they ventured to doubt the guilt of those who were accused of designs against the king's person. The whole nation was seized by a sort of epidemic madness. Danby, the prime minister, himself entered into it very furiously, and persisted in his inquiries notwithstanding all the king's advices to the contrary; and Charles himself, who was the only person that ought to have been most concerned, was the only one who treated it with contempt. Nothing, however, could check the popular phrenzy; and for a time the king was obliged to give way to it. Meanwhile accident after accident, occurring in a manner unparalleled in history, contributed to maintain the delusion, and to give temporary credibility to the infernal perjuries of Oates, Bedloe, and their associates in infamy. Letters were seized which discovered the Duke of York's correspondence with France, in opposition to the religion and interests of his country; Danby's correspondence, which involved the king in the disgrace of similar machinations, was also detected; and, to crown the whole, Godfrey, the magistrate who had first given publicity to the plot, was either murdered, or, which seems at least equally probable, committed suicide. This last occurrence made every good Protestant imagine that he felt a Catholic poniard at his throat; and, whilst it aggravated the terrors, confirmed the credulity, of the people. The verdict of wilful murder returned by the coroner's inquest on the body of Godfrey imparted the stamp of authority to all the reports previously in circulation. The ignorant believed and trembled, the artful secretly fomented the panic with which the nation was now seized. It was no longer safe to deny that Godfrey had been murdered by the Papists, or that the latter had conspired the destruction of the king, the constitution, and the church of England, with the extermination of every Protestant in the

kingdom. The plot having thus attained a sudden and bloated maturity, it was greedily adopted by the popular party as an engine against the court; and whilst the extraordinary hallucination lasted, every species of injustice and iniquity was perpetrated without compunction or remorse. Coleman, Ireland, Grove, Pickering, and others suffered death for an imaginary conspiracy, on the contradictory testimony of incredible witnesses; and after trials in which the judges and the juries seemed to vie with each other in abetting perjury. Nor was the reign of delusion and blood short-lived. For two years, Protestant credulity and vengeance were satiated, from time to time, with the invention of new horrors and the immolation of fresh victims; nor were these legal murders stayed till the execution of the venerable Lord Viscount Stafford excited pity and remorse in the public mind. This event seems to have contributed to awaken the nation from its trance; the still small voice of reason and humanity began again to be heard; men gradually shook off both the delusion and the panic by which they had been hurried into such excesses; and when they recovered the use of their faculties sufficiently to enable them to take a deliberate survey of the late proceedings, they were horrified alike at the iniquity which had been committed, and at the character of the diabolical miscreants by whose instrumentality it had been effected.

In the midst of this general uproar and persecution, the lord treasurer Danby was impeached in the House of Commons by Seymour the Speaker. The principal charge against him was, his having written a letter to Montague, the king's ambassador at Paris, directing him to sell the king's good offices at the treaty of Nimeguen, to the king of France, for a certain sum of money; contrary to the general interests of the confederates, and also to those of his own kingdom. But although the charge was just, Danby had the good fortune to find the king resolved to defend him. Charles assured the parliament that, as he had acted in every thing by his orders, he held him entirely blameless; and although he would deprive him of all his employments, yet he positively insisted on his personal safety. The Lords, however, still went on to impeach him, and Danby was sent to the Tower; but no worse consequences followed.

These proceedings were carried on by a House of Commons which had continued in existence above seventeen years. They were now dissolved, however, and another parliament was called; but this one proved as unmanageable as the preceding. The members resolved to check the growth of Popery by striking at the root of the evil; and therefore brought in a bill for the total exclusion of the Duke of York from the crown of England and Ireland, which passed the Lower House by a majority of seventy-nine. They next voted the king's standing army and guards to be illegal; and proceeding to fix limits to the king's power of imprisoning delinquents, the celebrated statute of *Habeas Corpus* was passed, which confirms to the subject an absolute security against oppressive power.

During these troubles the Duke of York had retired to Brussels; but an indisposition of the king induced him to return to England, to be ready, in case of accident, to assert his right to the throne. After prevailing with his brother to disgrace his natural son the Duke of Monmouth, who had now become very popular, he set out for Scotland, under pretence of quieting the apprehensions of the English nation, but in reality to strengthen his interests in that part of the kingdom. This proceeding, however, served still more to inflame the country party, who were strongly attached to the Duke of Monmouth, and resolved to support him against the Duke of York. Mobs, petitions, and burnings of the pope in effigy, were the artifices employed to keep up the terrors of the people, and to

Reign of
Charles II. alarm the court. The parliament had shown favour to the various tribes of informers, and that of course served to increase the number of these miscreants. Plots also became more numerous. Conspiracy was set up against conspiracy; and the people, uncertain what to believe or whom to trust, were kept in a state of the most dreadful apprehension.

But it was not by plots alone that the adverse parties endeavoured to supplant each other. Tumultuous petitions on the one hand, and adulatory addresses on the other, were sent up from all quarters. Wherever the country party prevailed, petitions were sent to the king, filled with grievances and apprehensions. Wherever the church or court party had the ascendancy, addresses were framed, containing expressions of the highest regard for his majesty, and the deepest abhorrence of those who endeavoured to disturb the public tranquillity. Thus the nation came to be distinguished into Petitioners and Abhorrrers. The names of *Whig* and *Tory*, also, were now first used as terms of reproach. The whigs were so denominated from a cant name given to the Presbyterian conventicles, "whig" being milk turned sour; and the tories received that honourable appellation from the Irish banditti so called, whose usual phrase, in ordering people to stand and deliver, was the Irish word *toree*, "give me."

During all this time the king had tyrannized over the Scots in a very cruel manner. Being apprized of the tendency of Presbyterian principles to a republican form of government, Charles, like his predecessors, had endeavoured to introduce Episcopacy there, but in a much more violent manner than had formerly been attempted. The rights of patrons had for some years been abolished, and the power of electing ministers had been vested in the kirk-sessions and lay elders; but it was now enacted, that all incumbents who had been admitted upon this title should receive a presentation, and be instituted anew by the bishop, under the penalty of deprivation. In consequence of this, three hundred and fifty parishes were at once declared vacant. New ministers were sought for all over the kingdom, and none was too vicious or ignorant to be rejected. The people, as might have been expected, were displeased to the highest degree, but gave no sign of mutiny or sedition, notwithstanding their discontent. This submission made their case still worse; it being rather hastily imagined, that, as they did not complain for a little ill usage, they would submit with equal patience to worse.

Affairs remained tolerably tranquil, till, in 1661, a severe act was passed in England against conventicles, which severity was imitated by the Scottish parliament, who passed an act of the same kind. Military force was next let loose on the people. Wherever they had forsaken their churches, the guards were quartered throughout the country. These legalized banditti were commanded by Sir James Turner, a man of a furious temper and dissolute life, who went about and received lists from the clergy, of those who absented themselves from the churches, or were supposed to frequent conventicles. Without proof or legal conviction, he exacted fines, and quartered soldiers on the supposed criminals till he received payment. An insurrection being dreaded during the Dutch war, new forces were levied, and intrusted to the command of Dalziel and Drummond, two men of savage dispositions, and the Scottish parliament gave full scope to whatever enormities they chose to commit.

Representations were now made to the king, who promised some redress. But his lenity came too late. In 1668 the people rose in arms, and having surprised Turner in Dumfries, resolved to put him to death; but finding his orders much more violent than his execution of them,

they spared his life. At Lanark they renewed the covenant, and published a manifesto, in which they professed submission to the king, and only desired the re-establishment of Presbytery, and the re-instatement of their former ministers. Their force never exceeded two thousand men; and although the country in general bore them great favour, men's spirits were so subdued, that the insurgents could expect no further increase of numbers. Dalziel took the field to oppose them. The number of the Covenanters had now been reduced to little more than a thousand, and these were no way capable of contending with regular forces. Having advanced towards Edinburgh, and met with no support, they attempted to make their way back to the west by the Pentland Hills. But at a spot called Rullion Green, they were attacked by the king's troops, and received the first charge with great firmness. This, however, was the whole action. They immediately fell into confusion and fled. About forty were killed on the spot, and a hundred and thirty taken prisoners.

As long ago as the year 1661 the Presbyterians had deputed Sharpe, then one of their number, to lay their grievances before the king. Instead of doing so, however, their deputy abandoned the cause altogether, became their violent enemy, and, as a reward of his treachery, was created Archbishop of St Andrews. After the affair of Pentland this man was the foremost to take vengeance on the unhappy insurgents, whose oppressed state and inoffensive behaviour made them objects of universal compassion. Ten were hanged on one gibbet in Edinburgh, and thirty-five before their own doors in different parts of the country. Some of them were previously tortured, and, after death, their mutilated limbs were stuck up in different parts of the kingdom. All of them might have saved their lives upon condition of renouncing the covenant; but this they absolutely refused. The executions were proceeding without mercy, when the king wrote a letter to the privy council, in which he ordered that such of the prisoners as simply promised to obey the laws for the future should be set at liberty, and that the incorrigible should be sent to the plantations. This letter was brought to the council by Burnet, but was not immediately delivered by Sharpe, whose renegade vengeance was not yet satiated. It had been customary to put these unfortunate men to the torture, in order if possible to make them confess that to be false which they believed to be true. By Sharpe's criminal delay had been tortured Hugh Maceail, a young preacher, who would otherwise have escaped; and so violent were the torments inflicted on him by the iron boot, that he expired under them. He seemed to die in an ecstasy of joy. His last words, uttered with an accent which struck all the bystanders with astonishment, were in the highest degree impressive and sublime. "Farewell sun, moon, and stars," exclaimed this lofty-minded enthusiast; "farewell world and time; farewell weak, frail body. Welcome eternity; welcome angels and saints; welcome Saviour of the world; and welcome God, the judge of all!"

In 1670 an act was passed against conventicles, with a professed design of mitigating the former persecuting laws, though even the mitigation was oppressive and tyrannical. By this act, the hearer in a conventicle, that is, in a dissenting assembly where more than five persons besides the family were present, was liable to a fine of five shillings for the first offence, and ten shillings for the second; while the preacher was fined twenty pounds for the first offence, and forty for the second. The person in whose house the conventicle assembled was declared subject to the same amount of fine as the preacher. In a remarkable clause it was provided, that if a doubt should arise as to the interpretation of any part of the act, the judges should always explain such doubt in the sense least favourable to

Reign of
Charles II.

Reign of Charles II. conventicles, inasmuch as it was the intention of parliament entirely to suppress them.

No religion was ever extirpated by subjecting its professors to imprisonment, confiscation, and death; and the government, which had plunged headlong into all the excesses of persecution, soon perceived that they had produced a very different effect from that which had been intended; that Presbytery had burst forth with fresh vigour in the midst of blood and oppression; and that the people, by being driven desperate, had become formidable. In this situation recourse was had to a notable expedient, which at once betrayed the jealousy of the government, and rendered it ridiculous. From some supposed analogy between the case of one subject dreading bodily harm from another, and a king jealous of his people, Sir George Mackenzie, afterwards king's advocate, conceived the brilliant idea of causing his majesty to take out a general writ of *lauchburrows* against his whole Scottish subjects. Accordingly, a bond of the peace was framed, by which the subscribers became bound, under heavy penalties, neither to frequent conventicles themselves, nor to allow their families and tenants to be present at such unlawful assemblies, and, in general, not in any way to infringe the public peace. By this extraordinary proceeding, the government, while it betrayed its fears, prostituted the dignity of the king, and incurred the ridicule of attempting to give additional sanction to public law by private contract.

But the violent methods used by the king having been found ineffectual to accomplish this purpose in Scotland, a Scheme of Comprehension was tried in 1678, by which it was proposed to diminish greatly the authority of the bishops, to abolish their negative voice in the ecclesiastical courts, and to leave them little more than the right of precedence among the presbyters. But this, too, was rejected by the people, who well knew its character and tendency. The next project was that of an Indulgence, by which the most popular of the expelled preachers, without being required to accede any terms of submission to the established religion, were settled in vacant churches; and small salaries of about twenty pounds a year were offered to the rest till they should be otherwise established. These tardy and suspicious boons were at first accepted by some of the less firm and decided preachers; but the trick,—for it was nothing more,—was soon discovered; and every man's motto became *Timeo Danaos et dona ferentes*. The replaced ministers soon repented their compliance; the bounty was rejected as the wages of criminal silence; conventicles multiplied; and the Covenanters, now at open hostility with the law, met in arms at their places of worship, though, after divine service, they dispersed quietly.

The expedients tried by the government having thus failed, the persecution of the Covenanters was renewed under the administration of Lauderdale, and strenuously abetted by Archbishop Sharpe. By an old law, but seldom put in execution, a man who was accused of any crime, and did not appear to take his trial, might be *intercommuned*, that is, he might be publicly outlawed; and whoever afterwards, either on account of business, relationship, or even charity, had the least intercourse with him,

was subjected to the same penalties which the law inflicted on the criminal himself. A great many *Letters of Intercommuning*¹ were now issued against the Covenanters. By this severe and absurd proceeding, crimes and punishments went on multiplying in a geometrical progression; and, lest the cry of an oppressed people should reach the throne, the council prohibited, under severe penalties, all noblemen and gentlemen of landed property from leaving the kingdom.

The course of these violent proceedings was distinguished by an event which, in all its circumstances, is eminently characteristic of the men who bore rule at this period. We allude to the trial and execution of James Mitchell for an attempt to assassinate the Archbishop of St Andrews ten years before. One evening in July 1668, as Sharpe was sitting in his coach at the head of Blackfriar's Wynd, waiting for the Bishop of Orkney, and while the latter was in the act of stepping into it, Mitchell, then a Presbyterian preacher, discharged a pistol at the dignified apostate; but the Bishop of Orkney, happening at the instant to extend his arm, intercepted the shot, and was severely wounded in consequence. This occurred in the principal street of the city; yet so generally was the archbishop hated, that the assassin was allowed to walk off without interruption; and, having turned down a street or two, he threw aside a partial disguise he had worn, re-appeared in public, and remained altogether unsuspected. Six years after this, Sharpe happening one day to notice a man who seemed to observe him narrowly, and dreading lest another attempt at assassination should be made, caused him to be arrested and examined. Two loaded pistols were found upon his person; and, as he was now concluded to have been the author of the former attempt, Sharpe promised, that if he would confess his guilt, he should be dismissed without any punishment. Mitchell (for it was he), was credulous enough to believe the archbishop, and was immediately produced before the council by the faithless primate. But this righteous conclave having no proof against him, and hoping to implicate in his crime the whole body of the Covenanters, solemnly renewed the promise of pardon, upon condition that he would make a full disclosure. Mitchell accepted the terms offered him; but when the council found, by this man's confession, that only one person, then dead, had been privy to his design, their rage and disappointment knew no bounds. He was immediately carried before the Court of Justiciary, and required to adhere to his confession, with certification that if he did not comply, he would forfeit the benefit of the assurance which had been given him. Mitchell now saw with whom he had to deal. On being judicially interrogated, he refused to confess, and was, in consequence, put to the torture, which he endured with singular fortitude; obstinately persisting in his refusal to criminate himself, till he fainted through excessive agony. As the boots (the instrument of torture) had failed to extort a confession, he was sent to the Bass, then used as a state prison for the persecuted Covenanters, and remained there loaded with irons, in the greatest misery, till the end of the year 1678, the period at which we have arrived. Infuriated at the failure of all their coercive measures, and resolved, by some new examples, to strike terror into the breasts of the

¹ Letters of Intercommuning, which bore an analogy to the *Aqua et Ignis Interdictio* of the Roman law, concluded thus: "We command and charge all our lieges and subjects, that none presume to reset, supply, or intercommune with any of the foresaid our rebels, nor furnish them with meat, drink, house, harbour, or victuals, nor any other thing useful or conformable to them; nor have any intelligence with them by word, writing, message, or otherwise, under pain of being repute and esteemed art and part with them in the crime foresaid, and to be pursued therefore with all rigour." (Laing, iv. 77, 78, 2d ed.; Wodrow, i. 392, 416-418; Burnet, ii. 156-183.)

Rem of Covenanters, the council once more produced him; and he was now indicted at the instance of Sir George Mackenzie, his majesty's advocate, upon 4 act of 16 Parl. of James VI., by which the invading of privy counsellors is made death. No proof of his guilt could be adduced except his former confession, which he judicially denied. But it was proved against him by the testimony of Lauderdale the commissioner, Rothes the chancellor, Maitland the lord-treasurer depute, and the archbishop of St Andrews, all of whom,—when it was alleged in behalf of the accused, that any confession he had emitted was upon promise of life *et spe venia*,—expressly swore, that no assurance of life had been given him, *although the records of the privy council remain to this hour the incontestible monument of their perjury!* The prisoner then produced a copy of the act of council which contained the assurance of his life, and moved that the original might be exhibited. This, however, was refused, on the pretence that the fact was already sufficiently established by the parole testimony of privy counsellors; and the unhappy man was accordingly condemned and executed.¹

When Lauderdale, who probably felt some remorse on account of the iniquitous means which had been used to obtain his conviction, wished to commute Mitchell's sentence, the unrelenting primate interposed, and insisted upon its execution, as the only way of securing his own life against a repetition of similar attempts in future. But he calculates ill who seeks protection by means of perjury, injustice, and cruelty. Some acts of local oppression, added to the hatred which was so generally entertained for him, brought down upon the primate the very fate which he thus sought to avoid. On the 3d of May 1679, he was waylaid and murdered in Magus Muir, near St Andrews, by a troop of fanatics, who had been driven to madness by his tyranny, and who, in perpetrating this unholy deed, were actuated solely by their own enthusiasm or revenge. But the act committed by these men was nevertheless imputed to the party to which they ostensibly belonged; and the consequence was, that all who attended field conventicles were ordered to be indiscriminately massacred. This brought matters to a crisis.

The Covenanters, finding themselves obliged to meet in large bodies, and bring arms for their own security, drew up a declaration against prelacy, which they published at Rutherglen, a small burgh near Glasgow; and in the market-place they burned the several acts of parliament which had established that mode of ecclesiastical government, and had prohibited all conventicles. For this purpose they chose the 20th of May, the anniversary of the Restoration, having previously extinguished the bonfires which had been kindled on that occasion. Graham of Claver-

house, afterwards Viscount Dundee, an active and merciless agent of the council, attacked a great conventicle upon Loudon Hill, but was repulsed with the loss of thirty men. The Covenanters, finding themselves thus unwarily engaged in rebellion, were obliged to persevere, and therefore pushed on to Glasgow, which, though repulsed at first, they afterwards made themselves masters of. Here they dispossessed the established clergy, and issued proclamations, in which they declared that they fought against the king's supremacy, against popery and prelacy, and against a popish successor to the crown.

Alarmed at this rising, Charles dispatched against the Covenanters a small body of English cavalry under the Duke of Monmouth, who, having joined the Scottish guards, and some regiments of militia levied from the well-affected counties, marched with great celerity in quest of the insurgents. They had taken post at Bothwell Bridge, between Hamilton and Glasgow; a good position, to which there was no access but by the bridge, which a small body might have defended against the king's army. The whole force of the Covenanters never exceeded 8000 men, and they had in reality no other generals than their clergymen. Monmouth attacked the bridge, and a party of the Covenanters stoutly maintained their post as long as their ammunition lasted. When they sent for a fresh supply, they received orders to quit their post and retire; and this imprudent measure occasioned an immediate defeat. Monmouth passed the bridge without opposition, and, drawing up his forces opposite to the enemy, soon put them to the rout, which, indeed, was effected by his cannon alone. About seven hundred were killed in the pursuit, for, properly speaking, there was no action. Twelve hundred were taken prisoners, and treated with humanity by Monmouth. Such as promised to live peaceably under the present government were dismissed; and about three hundred who refused this condition were shipped for Barbadoes, but unfortunately perished during the voyage. Two of their clergymen, however, were hanged. Soon afterwards an act of indemnity was passed; but Lauderdale took care that it should afford little protection to the unhappy Covenanters; for, although orders were given thenceforward to connive at all conventicles, he found means, under a variety of pretences, to elude the execution of them.

That Charles had formed a scheme for overturning the established religion, and substituting popery in its place, as well as for rendering himself absolute, is now certainly known. But in this he met with strenuous opposition from his parliaments; and as the present one seemed to surpass its predecessors in resisting the schemes of the court, the king was induced to dissolve them and to call another in 1680. By this step, however, he gained no-

¹ Sir George Mackenzie, at whose instance Mitchell, as we have seen, was prosecuted and capitally convicted, asserts, in his *History*, page 327, that when this unfortunate man was brought before the council, "he fell upon his knees and confessed the whole matter, without asking either life or promise of any favour;" which confession he also signed. This is abominable equivocation. Even supposing that Mitchell did not "ask either life or promise of any favour," if the council ultroneously gave him an assurance of pardon, was the obligation less binding on that account? But it appears from the face of the record, which still remains to impeach the Lord Advocate's veracity, that Sir George Mackenzie assisted at the council when Mitchell confessed and obtained assurance of his life; and, as if this had not been sufficient to overturn the statements of the public prosecutor, he himself, two sentences farther on, says that Mitchell, "being persuaded that extrajudicial confession was not binding, resiled; whereupon the council declared, that he had forfeited any promise that was made to him!" The same learned person affirms, that the act of council was "justly refused," because, "being posterior to the confession, it could not prove that the confession was upon promise of life; and that act designed to annul the confession, and so could not be made use of for astructing it." The act of council however states, in the most explicit terms, that "the confession was emitted upon promise of life," which implies that the "promise" was anterior to the "confession;" and as to the legal sophism, that the "act designed to annul the confession, and so could not be made use of for astructing it," to the extent of proving the "promise of life," it is sufficient to observe, that the act of council was legally probative of what had occurred there, and that if it was held competent to prove the "confession," it must have been equally so to establish the "promise" on which it was emitted. No one can doubt, therefore, that the production of the act was "refused," because it would have clearly instructed the "promise that was made" to Mitchell, and because four privy counsellors had, in order to effect this man's destruction, resolved to perjure themselves by swearing, in the face of the record of their own proceedings, that no assurance of life had been given him. Mackenzie adds, that the pannel's counsel, Sir George Lockhart, "refused to speak for him, being unwilling to offend Lauderdale." (*History, ubi supra.*)

Reign of
Charles II.

thing; for they voted the legality of petitioning the king, and fell with extreme severity on the Abhorers, who, in their addresses to the crown, had expressed their disapprobation of such petitions. Great numbers of this class were seized by their order in all parts of England, and committed to close custody; and the liberty of the subject, which had been so carefully guarded by their own recent law, was violated by such arbitrary and capricious imprisonments. But one Stowel of Exeter put a stop to these proceedings. He refused to obey the serjeant at arms who had been sent to apprehend him; and, standing upon his defence, declared that he knew of no law by which the House of Commons could pretend to commit him. The house, finding it equally dangerous to proceed or recede, got off by an evasion. They voted that Stowel was indisposed; and a month was allowed him for his recovery, about which, as may well be supposed, they gave themselves no further concern.

But the chief point laboured by the present parliament was the exclusion bill, which, though voted by a former house, had never yet made any further progress. In the present House of Commons it passed by a great majority, but was thrown out by the House of Peers. All the bishops except three voted against it; being of opinion that the church of England was in greater danger from the prevalence of Presbyterianism than from the introduction of popery. The Commons were extremely mortified at the rejection of their favourite bill, and in retaliation they passed several other disagreeable acts. Amongst these was one which set forth, that, till the exclusion bill was passed, they could not, consistently with the trust reposed in them, grant the king any manner of supply; and that whoever should hereafter lend, by way of advance, any money upon the branches of the king's revenue, should be responsible to parliament for his conduct. Finding that there were no hopes of extorting either money or compliance from the Commons, Charles came to a resolution of once more dissolving the parliament; and this accordingly took place while they were voting that the dissenters ought to be encouraged, and that the city of London had been burned by the papists.

It was for some time doubtful whether the king would ever call another parliament. But his necessities surmounted all his fears, and in 1681 he summoned a parliament to meet at Oxford, that he might thus have an opportunity of punishing the city of London, by showing his suspicions of their loyalty. In this, however, as in all former parliaments, the country party predominated; and they trode exactly in the footsteps of their predecessors. The same Speaker was chosen, and the exclusion bill urged more fiercely than before. Ernely, one of the king's ministers, went so far as to propose that the duke should be banished five hundred miles from England, and that on the king's decease the next heir should be appointed regent. Yet even this expedient, which left the duke only the barren title of king, failed to obtain the approbation of the house; nothing but a total exclusion could satisfy them.

The opposite factions had for some time indulged their animosities by reviling and ridiculing each other in pamphlets and libels; but this practice, too common in party warfare to deserve particular mention, was at length attended with an incident which deserves notice. One Fitzharris, an Irish adventurer, employed a Scotsman named Everard, who, like himself, hung loose on society, to write a libel against the king and the Duke of York. The Scot, who was actually a spy for the opposite party, supposing this a trick to entrap him, discovered the whole to Sir William Waller, a justice of the peace; and, to convince the magistrate of the truth of his information, secreted him and two other persons in a place where they overheard the whole con-

ference between Fitzharris and himself. The libel concocted betwixt them was replete with the utmost rancour and scurrility. Waller carried the intelligence to the king, and obtained a warrant for committing Fitzharris, who at the time happened to have a copy of the libel in his pocket. Finding himself in the hands of a party from which he could expect no mercy, Fitzharris resolved to change his game, and to throw the odium of the libel upon the court, who, he said, had employed him to draw it up with the view of imputing it to the exclusionists, and thus rendering them hateful to the people. And, in order to enhance his services in the estimation of the country party, he revealed to them a new popish plot, still more tremendous than any of those previously hatched, and accused the Duke of York as a principal accomplice in the conspiracy. The king, however, imprisoned Fitzharris in Newgate. But the Commons immediately espoused his cause, and voted that he should be impeached by themselves, in order to screen him from the ordinary forms of justice. The Lords rejected the impeachment; the Commons asserted their right; and a commotion was likely to ensue, when the king, in order to break off the contest, went to the house and dissolved the parliament, with a fixed resolution never to call another.

From this moment the king ruled with despotic sway. His temper, which had generally been easy and merciful, now became arbitrary and cruel; he entertained spies and informers round the throne, and imprisoned all those whom he thought most daring in their designs. In particular, he resolved to humble the Presbyterians. They were divested of all their employments, and their offices given to such as were favourable to the court, and approved the doctrine of non-resistance. The clergy began to testify their zeal and their principles by their writings and sermons; but although the partizans of the king were the most numerous, those of the opposite faction were the most enterprising. The king openly espoused the cause of the former; and thus placing himself at the head of a faction, he deprived the city of London, which had long headed the popular party, of their charter. Terror was also employed to confirm this new species of monarchy. Fitzharris was brought to trial, condemned, and executed. The whole gang of spies, witnesses, informers, and suborners, who had long been encouraged and supported by the leading patriots, finding now that the king was entirely master, turned short upon their ancient employers, and tendered evidence against those who had first put them in motion. The king's ministers gave encouragement to these miscreants; and in a short time the same injustice and the same cruelties were practised under pretence of Presbyterian, as had formerly been committed under the delusive apprehension of Catholic treasons. But the king's chief resentment was levelled against the Earl of Shaftesbury; and not without reason, as he had been very active in the late disturbances. No sums were spared to seek for evidence, nor even to suborn witnesses, against this intriguing and formidable man. A bill of indictment was presented to the grand jury, and witnesses were examined, who swore to such incredible circumstances as must have invalidated their testimony, even if they had not been branded as perjured villains. Amongst his papers, indeed, was found a draught of an association, which might have been construed into treason; but it was not in the earl's handwriting, nor could it be proved that he had ever communicated this scheme to any body, or signified his approbation of any such project. But the sheriffs had taken care to summon a jury whose principles coincided with those of the earl; and in that, more than in any insufficiency of proof, consisted his safety. The bill was ignored by the grand jury; the hall resounded with ap-

Reign of
Charles I.

Reign of Charles II.
 Reli of plause; and the day was closed with the ringing of bells, the burning of bonfires, and other demonstrations of popular joy.

But it was in Scotland that the character of the restored government appeared in its most hideous features. The duke, after a temporary exile from Britain, had been sent to that country; and there, during his administration, he exercised a tyranny, if possible still more frightful than that of Lauderdale. The battle of Bothwell Bridge had tamed the spirit of the Covenanters, and many of them, by frequenting the churches of the indulged ministers, succeeded in screening themselves from the vengeance of the government. But there was still left a remnant of faithful adherents of the covenant, inconsiderable in number, and despicable in point of influence, but men of stern character, exalted enthusiasm, and indomitable zeal, who followed their spiritual guides, Cargill and Cameron, into the wilderness, and, amidst the glens and morasses, were fed by them with the manna of the divine word. Hunted like partridges on the mountains, and subjected to military execution wherever they were caught, these men, naturally led to inquire into the authority of those by whom their sufferings were inflicted, came as naturally to the conclusion, that the king having broken the condition upon which he received the crown of Scotland, by rejecting the covenant, had therefore forfeited all right to the exercise of the regal authority. Deeply convinced of the truth of this doctrine, Cameron, accompanied by twenty persons of his sect, proceeded to Sanquhar, and there published "A Declaration and Testimonie of the true Presbyterian, Anti-Prelatic, Anti-Erastian, and persecuted Party in Scotland," setting forth their grievances, disowning the king by reason of his tyranny, proclaiming war against him as a tyrant and usurper, and testifying against the reception of the Duke of York, a professed Papist, in Scotland, as repugnant to their principles, and their vows to the most high God. This persecuted remnant, who mustered in all twenty-six horse and forty foot, now prepared to support their bold defiance by force of arms; but they were surprised, defeated, and dispersed, by three troops of dragoons, at Airmoss, in the district of Kyle. Cameron fell in the skirmish, fighting with heroic courage; his brother, with seven of his companions, shared his fate; Hackston of Rathillet, who had been a passive spectator merely of the murder of Sharpe, and a few others, were wounded and made prisoners. Cargill escaped from the field, and prepared to avenge the death of his friends. Having repaired to Torwood in Stirlingshire, and assembled a number of his disciples, henceforward known by the name of Cameronians, he proceeded, after a lecture and sermon, to excommunicate the king, "for his mocking of God, his perjury, his uncleanness of adultery, his drunkenness, and his dissembling with God and man;" the Duke of York, for idolatry; the Duke of Monmouth, for invading God's people at Bothwell Bridge; the Duke of Lauderdale, for blasphemy, apostacy, and adultery; and the Duke of Rothes, Sir George Mackenzie, and Dalziel of Binns, for different offences. He concluded by declaring that "no power on earth, of kings, princes, magistrates, or ministers, of the gospel, could, without the repentance of the persons openly and legally appearing, reverse this excommunication;" and there can be no doubt whatever that his affirmation was most devoutly believed.

These proceedings exasperated the council beyond all measure, and hurried them into the commission of unparalleled atrocities. The prisoners brought from Airmoss were executed with every circumstance of barbarity; a strict search was made, not only after their associates, but also for the professors of their doctrines; and of the latter, many, including females, testified with the loss of their

Reign of Charles II.
 lives the sincerity of their belief. Even those innocent of all offence towards the government were insidiously involved in the same fate with those who had openly defied it. Taking advantage of the spirit which the cruelties of the government had alone excited and inflamed, the privy council sought to entrap fresh victims by means of ensnaring questions, thus imitating the great master they served, in tempting men to sin, that they might have the pleasure of punishing them for it. Was Archbishop Sharpe's death murder? Was the rising at Bothwell Bridge rebellion? Is Charles a rightful king or a tyrant? Such were the interrogatories put to the victims of rage and suspicion, who being for the most part too sincere to dissemble their opinions, and too fearless to be intimidated even by the most cruel tortures, were commonly dismissed from the iron boot to the court of justiciary, and thence, by a rapid transition, to the scaffold.

But the mass of the people were not the only objects of this fierce and frantic tyranny. Anon it took a higher flight, and struck at the Earl of Argyll, a man whose only fault appears to have consisted in his submission to the frightful misrule under which his country had so long groaned; a submission dictated by a love of peace, not by an approval of its enormities. When required, as a privy counsellor, to take a self-contradictory test, which the Scottish parliament had prescribed, Argyll accepted it with an explanation, that he took it in as far as it was consistent with itself and the Protestant religion, adding, that he would "not debar himself from endeavouring in a lawful way, and in his station, to make such changes in the church and state as he might judge beneficial." For this explanation he was imprisoned in the castle of Edinburgh, brought to trial, and, by an infamous perversion of his words, a charge of treason made out against him. Nairne, a superannuated judge, carried into court at midnight to make a majority on the relevancy of the indictment, fell asleep during the proceedings, and was only awakened to give his vote. A jury of Argyll's personal enemies, with the Marquis of Montrose at their head, found him guilty of treason, leasing-making, and leasing-telling, though not of the perjury libelled; and he received sentence of death, although the execution of it was suspended during the king's pleasure. But Argyll did not choose to trust to the tender mercies of his enemies. He escaped from the castle in disguise, and thus saved his life; but sentence of attainder was passed against him. After the defeat of the exclusionists, and the dissolution of parliament, the duke was recalled to England; but the consequent change of administration was productive of little or no relief to this oppressed country.

In 1683 the city of London was deprived of its charter, which was only restored upon terms of abject submission, and its giving up the nomination of its own magistrates. This was so arbitrary a proceeding, that all the other corporations in England began to dread the same treatment, and, in fact, were successively induced to surrender their charters into the hands of the king. Considerable sums were exacted for the restoration of these charters, and all the offices of power and profit were left at the disposal of the crown. Resistance now, however justifiable, was no longer safe; and prudent men saw no other expedient but submitting with patience to the present grievances.

There was a party in England, however, which still cherished their former ideas of freedom, and resolved to restore liberty to their country by dethroning the monarch who acted in a manner so despotic and arbitrary. The principal members of this confederacy were Monmouth, Shaftesbury, Russell, Essex, Howard, Algernon Sidney, and John Hampden, grandson to the great man

Reign of Charles II. of that name. Monmouth engaged the Earl of Macclesfield, Lord Brandon, Sir Gilbert Gerard, and other gentlemen in Cheshire; Lord Russell entered into a correspondence with Sir William Courtney, Sir Francis Knowles, and Sir Francis Drake, who promised to raise the west; and Shaftesbury, with one Ferguson, a restless plotter, undertook to manage the city, upon the aid of which the confederates chiefly relied. These schemes had been laid in 1681. But the caution of Lord Russell, who induced the Duke of Monmouth to postpone the enterprise, saved the kingdom from the horrors of a civil war; whilst Shaftesbury was so struck with a sense of his impending danger, that he left his house, and lurking about the city, attempted in vain to force the Londoners into open insurrection. Enraged at the numberless cautions and delays which clogged and defeated his projects, he at last threatened to begin with his own friends singly; but after a long struggle between fear and exasperation, he abandoned all hopes of success, and fled to Amsterdam, where he soon afterwards died. But the loss of Shaftesbury, though it retarded, did not put an end to the designs of the patriots. The remaining six formed a council, corresponded with Argyll and the malcontents in Scotland, and, though they widely differed in principles from one another, resolved to prosecute the scheme of the insurrection. Monmouth aspired to the crown; Russell and Hampden proposed to exclude the Duke of York from the succession, and to redress the grievances of the nation; Sidney was for restoring the republic; and Essex shared the same wishes and opinions. Lord Howard was an abandoned man, who, having no fixed principles of any kind, sought to embroil the nation, in hopes of advancing his own private interest during the confusion.

Besides these there was a subordinate set of conspirators, who frequently met together, and carried on projects quite unknown to Monmouth and his council. Among them was Colonel Rumsey, a military adventurer; Lieutenant-Colonel Walcot, a man of the same stamp; Good-enough, under-sheriff of London, a zealous and noted party-man; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London. But Rumsey and Ferguson were the only persons who had access to the great leaders of the conspiracy. These men took the resolution of assassinating the king in his way to Newmarket; and as Rumboldt, one of the party, possessed a farm upon the road called the *Rye-house*, the conspiracy was thence called the *Rye-house Plot*. The scheme they had fixed on was to stop the king's coach by overturning a cart on the highway at this place, and to shoot him through the hedges. But the house in which the king lived at Newmarket having accidentally taken fire, he was obliged to leave that place eight days sooner than was expected, and to this circumstance he owed his safety. Soon afterwards the conspiracy was discovered; Russell, Sidney, and Walcot, were executed; Essex cut his own throat; Hampden was fined forty thousand pounds; and scarcely one escaped who had been in any manner concerned, except the Duke of Monmouth, who was the most culpable of all.

This was the last blood shed on account of plots or conspiracies, which had abounded during the greater part of this reign. Severe punishments, however, were inflicted on many who had treated the Duke of York unworthily. The infamous Titus Oates was fined a hundred thousand pounds for calling him a popish traitor, and was imprisoned till he paid the mulct, which he was absolutely incapable of doing. A similar sentence was passed upon Dutton Colt; and Sir Samuel Barnadiston was fined ten thousand pounds for having in some private letters reflected on the government. The government of Charles

was now as absolute as that of any prince in Europe; but Reigned to please his subjects by a popular act, he judged it proper to marry the Lady Anne, his niece, to Prince George, brother to the king of Denmark; which was the last transaction of this extraordinary reign.

On the second of February 1685, about eight in the morning, the king was seized with a fit of apoplexy, as he came dressed out of his closet, where he had been for some time after he rose from bed. Being immediately bled, he was restored to his senses, and hopes were entertained of his recovery. But on the fourth day the physicians despaired of his life, and therefore sent for the queen. He was in his perfect senses, when she arrived. She threw herself on her knees, and asked his pardon for all her offences. He replied that she had offended in nothing, but that he had been guilty of offences against her, and asked her pardon. He spoke with great affection to the Duke of York, and gave him excellent counsel for his future conduct, advising him to adhere to the laws with strictness, and invariably to support the church of England. But the duke seemed anxious to convince his brother before he died how little he intended to follow his advice. Having removed the bishops, and several of the lords who attended at the bedside of the king, he sent for Huddleston, a Catholic priest, who, in the presence of the duke, the Earl of Bath, and Trevannion, a captain in the guards, gave extreme unction to the king, and administered to him the sacrament according to the rites of the church of Rome. All this was done in about the space of half an hour. The doors were then thrown open; and six prelates, who had before attended the king, were sent for to give him the sacrament. Kenn, bishop of Bath and Wells, read the visitation of the sick, and, after the dying man had said that he repented of his sins, the absolution. The king assisted with seeming devotion at the service; but his mouth being distorted with fits, and his throat contracted, he could not swallow the elements. He professed, however, his satisfaction with the church of England, and expired on the 6th of February, after a reign of twenty-four years, and in the fifty-fifth year of his age.

In person Charles was tall and well-proportioned, with a swarthy complexion and features austere and forbidding. His constitution, originally sound and robust, he had in his youth impaired by indulgence, and afterwards laboured to restore by attention to diet and exercise. In disposition he was kind, familiar, communicative; delighting in social converse; averse to parade and ceremony; and eager, on all occasions, to escape from the trammels of official dignity to the ease and comfort of colloquial familiarity. He had good talents; but these were joined to an insuperable antipathy to application, which disqualified him for business, and kept him in a state of ignorance disgraceful to one in his station. He sought amusement alone, and seems to have cared little for any thing beyond the gratification of this propensity. He looked upon the practice of dissimulation as the grand secret in the art of reigning. Surrounded by men who made it their object, as it was their interest, to deceive him, his only protection, he argued, consisted in the employment of the same weapon, and it was necessary for him to deceive, that he might not be deceived. During his whole reign he was the slave of women; and his court became a school of vice, in which all the restraints of morality and even decency were laughed to scorn; whilst the distinctions he lavished on his mistresses enabled them to put a bold front on their infamy, and, holding out an encouragement to crime, tended to sap in youthful breasts those principles of modesty which are the best guardians of female virtue. "There may have been other periods of our history in which immorality prevailed,"

Reign of James II. says Dr Lingard; "but none in which it was practised with more ostentation, or brought with it less disgrace." Of Charles's pecuniary transactions with France it is impossible to think without feelings of shame, or to speak except in the language of reprobation. They were equally disgraceful in themselves, and humiliating to the nation, which had at its head a king who thus sold himself to its natural rival and enemy. That he cherished designs subversive of the liberties of the subject, is evinced by the whole tenor of his conduct, especially during the latter part of his reign; and had he been as active in his habits as he was unprincipled in his character and despotical in his disposition, the constitution might have been overthrown, and a monarchy as absolute as any in Europe erected on its ruins. With respect to what he was pleased to call his religion, he appears to have been a deist; and although he had embraced the Catholic worship before the restoration, yet he was not formally reconciled to the church of Rome until the eve of his death. By this means he was enabled to play the hypocrite, and, for five-and-twenty years, to hold himself out as an orthodox protestant, whilst he satisfied his conscience by secretly professing Catholicism, and in reality believed no religion at all. Finally, in all the relations of life, whether public or private, he was equally unprincipled, profligate, false, immoral, vicious, and corrupt; whilst, from the example of his debauched and licentious court, public morals contracted a taint, which it required little less than a century to obliterate, and which for a time wholly paralysed the character of the nation.

CHAP. VII.

REIGN OF JAMES II.

Accession of James II.—Slavish Addresses.—Remarkable one by the Quakers.—Imprudent Measures of the King.—Measure in favour of the Catholics.—Monmouth's Conspiracy.—Defeat and Execution of Argyll.—Landing of Monmouth.—Battle of Sedgemoor.—Defeat, Capture, and Execution of Monmouth.—James endeavours to establish Popery.—Parliament dissolved.—Catholics promoted.—Opposition of the English Clergy.—An ambassador sent to Rome.—Declarations in favour of liberty of conscience.—The seven Bishops imprisoned.—Popular commotions.—Trial and acquittal of the Bishops.—Attachment of the army to the Protestant Cause.—Birth of the Prince of Wales.—Treachery of Sunderland.—Proceedings of the Prince of Orange.—Invited to England by the malcontents.—James warned of his danger by the French king.—Rejects all offers of assistance.—Paralysed by the news of the intended invasion.—Perfidy of Sunderland.—Vain attempts at conciliation.—Landing of William Prince of Orange.—Defection of James's army.—Distressing situation of the King, who is deserted even by his own children.—Conduct of William.—James attempts to quit the kingdom, but is seized and detained.—His distress.—Return to London.—Ordered to leave the palace.—Urged to remain by some of his adherents.—His refusal.—Lands in France.—The throne declared vacant.—William raised to the Sovereignty in conjunction with the Princess Mary his wife.

The first act of James II.'s reign was to assemble the privy council, in which, after bestowing some praise on the memory of his predecessor, he made professions of his resolution to maintain the established government both in church and state; and as he had heretofore ventured his life in defence of the nation, he declared that he would still go as far as any man in maintaining all its just rights and privileges.

This discourse was received with great applause, not only by the council, but by the whole nation. Addresses came from all quarters, full of duty, nay, of the most servile adulation. From this charge, however, must be excepted that of the Quakers, which is remarkable for its

good sense and simplicity. "We are come," said they, "to testify our sorrow for the death of our good friend Charles, and our joy for thy being made our governor. We are told that thou art not of the persuasion of the church of England, no more than we; wherefore we hope that thou wilt grant us the same liberty which thou allowest thyself, which doing, we wish thee all manner of happiness."

The king, however, soon showed, either that he was not sincere in his promises, or that he entertained so lofty an idea of his own regal power, that even his utmost sincerity could tend but little to the security of the liberties of the people. All the customs, and the greater part of the excise, which had been voted to the late king for his life only, were levied by James without any new act for that purpose. He went openly to mass with all the ensigns of his dignity, and even sent one Caryl as his agent to Rome to make submissions to the pope, and to pave the way for the re-admission of England into the bosom of the Catholic church. By the suggestions of these men all his measures were undertaken. One day when the Spanish ambassador ventured to advise his majesty against putting too much confidence in such kind of people, "Is it not the custom in Spain," said James, "for the king to consult with his confessor?" "Yes," answered the ambassador, "and that is the reason why our affairs succeed so very ill."

James's first parliament, which was composed mostly of zealous Tories, was strongly inclined to comply with the measures of the crown, and passed a unanimous vote, settling on James during life all the revenue enjoyed by the late king till the time of his decease. For this favour James assured them that he would secure them in the full enjoyment of their laws: but with regard to religion no answer could be extorted from him, for that he was resolved at all hazards to change. In every thing except religion, however, James merited commendation. He applied himself to business with unremitting attention; he managed his revenue with the strictest economy; he retrenched superfluous expenses, and showed himself zealous for the glory of the nation; he endeavoured to expel from court the vice which had prevailed so much during the former reign, and to restore decency and morality; he presided daily at the council, and at the boards of admiralty and treasury; he even entered into the whole detail of the concerns of the great departments of the state. But his bigoted attachment to the Roman Catholic religion sullied all his good qualities, and rendered him feared for his violence, where he was not despised for his weakness.

But whilst every thing remained in tranquillity at home, a storm was gathering abroad. For a long time the Prince of Orange had entertained hopes of ascending the British throne, and had even used endeavours to exclude James. Monmouth, who, since his last conspiracy, had been pardoned, but ordered to depart the kingdom, had retired to Holland, where he was received by the Prince of Orange with the highest marks of distinction, and became his chief favourite. When the news of Charles's death arrived, indeed, the prince made a show of changing his tone, and dismissed Monmouth, but still kept up a close correspondence with him. The duke retired to Brussels; and, having resolved to invade England, he was seconded by the Earl of Argyll, who formed the scheme of exciting an insurrection in Scotland. But the generosity of the Prince of Orange did not correspond with the warmth of his professions. The unfortunate duke derived from his own plate and jewels his whole supply for the war; whilst the enthusiasm of a rich widow supplied Argyll with ten thousand pounds, with which he purchased three vessels, and loaded them with arms and ammunition.

Reign of James II.

Reign of
James II.

Having landed in Scotland, Argyll published his manifestoes, put himself at the head of two thousand five hundred men, and strove to influence the people in his favour. But a formidable body of the king's forces having marched against him, his army fell away; and he himself, after being wounded in attempting to escape, was taken prisoner by a peasant, carried to Edinburgh, and, after suffering many indignities, publicly executed.

By this time Monmouth had landed in Dorsetshire with scarcely a hundred followers. His name, however, was so popular, and so great was the hatred of the people to James on account of his religion, that in four days he had assembled a body of above two thousand men, and continuing to make a rapid progress, in a short time found himself at the head of six thousand men; but he was daily obliged to dismiss great numbers for want of arms. Alarmed at his invasion, the king recalled six regiments of British troops from Holland; and a body of regulars, to the number of three thousand, was sent, under the command of the Earl of Feversham, and of Lord Churchill, to check the progress of the rebels. They took post at Sedgemoor, a village in the neighbourhood of Bridgewater, and were joined by considerable numbers of the country militia. Here Monmouth resolved to make a stand; and having drawn up his followers in the best order he could, he drove the royal infantry from their ground, and was on the point of gaining a complete victory, when the cowardice of Gray, who commanded the horse, ruined all. This nobleman fled at the first onset; and the insurgents being charged in flank, gave way after a contest of three hours. About three hundred were killed in the engagement, and a thousand in the pursuit. Monmouth fled above twenty miles from the field of battle, till his horse sunk under him. He then alighted, and, exchanging clothes with a shepherd, fled on foot, attended by a German count who had accompanied him from Holland. Being at length quite exhausted with hunger and fatigue, they both lay down in a field, and covered themselves with fern. Meanwhile the shepherd being found in Monmouth's dress, increased the diligence of the search; and by means of bloodhounds he was detected in his miserable situation, with raw peas in his pocket, on which he had subsisted for some days. He burst into tears when seized by his enemies, and petitioned, with abject importunity, for his life.

He also wrote to the queen dowager; he sent a letter to the reigning queen, as well as to the king himself; and he begged his life, when admitted into the presence of James, with a meanness unsuitable to his pretensions and high rank. But all his entreaties and submissions were of no avail. James told him that he was much affected at his misfortunes, but that his crime was too dangerous in its example to be left unpunished. In his last moments Monmouth behaved with a magnanimity worthy of his former courage. When he came to the scaffold, he conducted himself with decency and even with dignity. He spoke little, he made no confession, nor did he accuse any of his friends. The circumstances attending his death excited horror among the spectators. The executioner missed his aim, and struck him slightly on the shoulder. Monmouth raised his head from the block, and looked him full in the face, as if reproaching him for his mistake. The man struck twice again, but feebly, and then threw away the axe. The sheriff forced him to renew his attempt; and the head of the duke, who seemed already dead, was at last severed from his body.

Those concerned in the Duke of Monmouth's conspiracy were punished with the utmost severity. Immediately after the battle of Sedgemoor, Feversham hanged up above twenty prisoners, and was proceeding with his executions

when the Bishop of Bath and Wells informed him that these unhappy men were now by law entitled to a trial, James II. and that their execution would be deemed murder. Nineteen were put to death in the same manner at Bridgewater by Colonel Kirke, a man of a thoroughly savage and bloody disposition. This miscreant, practised in the arts of slaughter at Tangiers, where he had served in garrison, took pleasure in committing acts of wanton barbarity, and ravaged the whole country without making any distinction between friend and foe; his own regiment being designated, by way of eminence, "Kirke's Lambs." The natural brutality of this man's temper was inflamed by continual intoxication. No fewer than eighty were executed by his orders at Dorchester; and on the whole, at Exeter, Taunton, and Wells, two hundred and fifty are computed to have fallen by the hand of justice, as it was called, under the auspices of Judge Jefferies, who had been sent down to try the delinquents. This man, not satisfied with the sacrifice of the principals, charged the juries to search out the aiders and abettors of the rebellion; and those persons who, in compassion for the wretched fugitives, had afforded them an asylum, were denounced and punished as such. Even women did not escape, and two, Lady Lisle and Mrs Gaunt, were sentenced to be burned alive for similar acts of humanity. Jefferies, on his return from his campaign in the west, was immediately created a peer, and soon after invested with the dignity of chancellor. In his Memoirs James complains, with apparent indignation, of "the strange havoc made by Jefferies and Kirke in the west," and attributes the unpopularity which afterwards deprived him of the crown to the violence and barbarity of those pretended friends of his authority.

James now began to throw off the mask, and to endeavour openly to establish popery and arbitrary power. He told the House of Commons that the militia were found by experience to be of no use; that it was necessary to augment the standing army; and that he had employed a great many Catholic officers, in whose favour he had thought proper to dispense with the test required to be taken by all who were employed by the crown. These stretches of power naturally led the Lords and Commons into some degree of opposition; but they soon acquiesced in the king's measures, and then the parliament was dismissed for their tardy compliance.

The parliament being dissolved, James's next step was to secure a Catholic interest in the privy council. Accordingly four Catholic lords, Powis, Arundel, Bellasis, and Dover, were admitted as members. Sunderland, who saw that the only way to gain preferment was by popery, became a convert. Rochester, the treasurer, was turned out of his office because he refused to conform. Even in Ireland, where the Duke of Ormond had long supported the royal cause, this nobleman was displaced as being a Protestant, and the Lord Tyrconnel, a furious Catholic, was placed in his stead. In his zeal for popery, it is said that James stooped so low as even to attempt the conversion of Colonel Kirke; but the daring soldier told him that he was pre-engaged, for he had promised the king of Morocco, when he was quartered at Tangiers, that if ever he changed his religion he would turn Mahomedan. At last the clergy of the church of England began to take the alarm, and commenced an opposition to court measures. The pulpits now thundered out against popery; and it was in vain that James attempted to impose silence on this topic. Instead of avoiding the controversy, the Protestant preachers pursued it with greater warmth.

To effect his designs, the king determined to revive the High Commission Court, which had formerly given the nation so much disgust, and which had been abolished for ever by act of parliament. An ecclesiastical commission was

Reign of
James II.

Reign of James II. accordingly issued; by which seven commissioners were invested with full and unlimited authority over the whole church of England. The next step was to allow liberty of conscience to all sectaries. This was done in the belief that the truth of the Catholic religion would, upon a fair trial, gain the victory. Besides, the same power that granted liberty of conscience might restrain it; and the Catholic religion alone would thus predominate. He therefore issued a general indulgence, declaring that non-conformity to the established religion was no longer penal; but in Scotland he ordered his parliament to grant a toleration only to the Catholics, without interceding in the least for the other dissenters. In Ireland the Protestants were totally expelled from all offices of trust and profit, and Catholics put in their places. These measures sufficiently disgusted every part of the British empire; but to complete the work, James publicly sent the Earl of Castlemaine as ambassador extraordinary to Rome, in order to express his obedience to the pope, and reconcile his kingdoms to the Catholic communion. This proceeding was too precipitate to be relished even by the pope himself; and therefore the only return he made to this embassy was the sending a nuncio into England. Soon after this the Jesuits were permitted to erect colleges in different parts of the kingdom, and to exercise the Catholic worship in the most public manner.

In 1686 a second declaration in favour of liberty of conscience was published almost in the same terms with the former, but with this particular injunction, that all divines should read it after service in their churches. The clergy resolved to disobey this order. Loyd, bishop of St Asaph, Kenn of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawney of Bristol, together with Sancroft the primate, concerted an address in the form of a petition to the king, which, with the warmest expressions of zeal and submission, signified that they could not read the declaration consistently with their consciences or the respect they owed the Protestant religion. The king received their petition with marks of surprise and displeasure. He said he did not expect such an address from the church of England, particularly from some amongst them; and persisted in his orders for their obeying his mandate. As the petition had been delivered in private, the king summoned the bishops before the council, and there questioned them whether they would acknowledge it. They for some time declined giving an answer; but being urged by the chancellor, they at last owned the petition. On their refusal to give bail, an order was immediately issued for their commitment to the Tower, and the crown lawyers received directions to prosecute them for a seditious libel. The king gave orders that they should be conveyed to the Tower by water, as the whole city was in commotion in their favour. But the people, when informed of their danger, ran to the river side in great multitudes, craving their blessing, and calling upon Heaven to protect them; whilst the very soldiers by whom they were guarded kneeled down before them and implored their forgiveness. The 29th of June 1686 was fixed for the trial of the bishops. Twenty-nine peers, a great number of gentlemen, and an immense crowd of persons, waited upon them to Westminster Hall. The discussion was learnedly managed by the lawyers on both sides. The jury withdrew into a chamber, where they passed the whole night; but next morning they returned into court, and pronounced the bishops not guilty. Westminster Hall instantly rang with loud acclamations, which were communicated to the whole extent of the city, and even reached the camp at Hounslow, where the king was at dinner in Lord Feversham's tent. His majesty demanded the cause of those rejoicings, and being informed that it was nothing

Reign of James II. but the soldiers shouting for the delivery of the bishops, "Call you that nothing?" said he; "but so much the worse for them."

As the king found the clergymen everywhere averse to his measures, he was willing next to try what he could do with the army, thinking that if one regiment could be brought to promise implicit obedience, their example would soon induce others to comply. He therefore ordered one of the regiments to be drawn up in his presence, and desired that such as were against the late declaration of liberty of conscience should lay down their arms. He was surprised to see the whole battalion ground their arms, except two officers and a few Roman Catholic soldiers. A few days before the acquittal of the bishops the queen was delivered of a son. This, if any thing could at that time, might have served to establish James on the throne; but so violent was the animosity against him, that a story was propagated that the child was supposititious; and the monarch's pride scorned to take any precautions to refute the calumny.

Though the enthusiasm of James himself was sufficiently extravagant, the wildest of his religious projects seem to have been suggested by his enemies in order to accomplish his ruin. The Earl of Sunderland, whom he chiefly trusted, was a man of abandoned principles, insatiable avarice, and fitted by nature for stratagem, deception, and intrigue. The love of money was his ruling passion, and he accordingly sold his influence to the highest bidder. To such a degree was he mercenary, that he became at once the pensioner of the Prince of Orange and of the king of France. The former, who had long fixed his eye on the English throne, watched James's motions, and took every advantage of his errors. He had laid his schemes so extensively, that nothing but the birth of a male heir to the crown of England seemed likely to prevent him from obtaining an almost immediate possession of the kingdom; and he had the address to render two thirds of the powers of Europe interested in his success. The treaty of Augsburg, formed to break the power of France, could not accomplish its object without the accession of England. The house of Austria, in both its branches, preferred their political views to their zeal for the Roman Catholic faith, and promoted the dethronement of James as the only means of humbling Louis XIV. Odeschalchi, who under the name of Innocent XI. then filled the papal chair, was also gained to the measures of the Prince of Orange by other considerations, as well as through his fixed aversion to France.

Seeing the national discontent now raised to the highest pitch, the Prince of Orange resolved to take advantage of it. He began by giving one Dykevelt, his envoy, instructions to apply in his name to every religious sect in the kingdom. To the church party he sent assurances of favour and regard; protesting that his education in Holland had no way prejudiced him against Episcopacy. To the non-conformists he sent exhortations not to be deceived by the insidious caresses of their known enemy, but to wait for a real and sincere protector. In consequence of these insinuations, the prince soon received invitations from the most considerable persons in the kingdom. Admirals Herbert and Russell assured him in person of their own and the national attachment. Henry Sidney, brother to Algernon, and uncle to the Earl of Sunderland, came over to him with assurances of a universal combination against the king. Lord Dumblane, son to the Earl of Danby, being master of a frigate, made several voyages to Holland, and carried from many of the nobility tenders of duty, and even considerable sums of money, to the Prince of Orange. Soon after, the Bishop of London, the Earls of Danby, Nottingham, Devonshire, Dorset, and several other lords, gentlemen, and principal citizens, united in their

Reign of
James II.

addresses to him, and entreated his speedy descent. The people, though long divided between whig and tory, now joined against their misguided sovereign as against a common enemy. William therefore determined to accept their invitation; and this the more readily, as he perceived that the malcontents had conducted themselves with prudence and secrecy. Having the principal servants of James in pay, he was minutely informed of the most secret actions and designs of that prince. His intelligence came through Sidney from Sunderland, who betrayed the very measures which he himself had advised. The prince had a fleet ready to sail, and troops provided for action, before the beginning of June 1688.

The king of France was the first who gave James warning of his danger, and offered to assist him in repelling it. But he declined this friendly offer, lest it should be said that he had entered into a private treaty with that monarch to the prejudice of the Protestant religion. Being also deceived and betrayed by Sunderland, he had the weakness to believe, that the reports of an invasion were invented in order to frighten him into a strict connection with France. He gave credit to the repeated assurances of the States, that the armament preparing in their ports was not designed against England; nay, he even believed the assertions of the prince himself, whose interest it was to deceive. Sunderland descanted against the possibility of an invasion, and turned into ridicule all who believed the report. Having, with the consent of James, taken possession of all the foreign correspondence, he suppressed every kind of intelligence that might alarm; and all others whom James trusted, except Dartmouth, affected long to place no faith in the reports of an invasion. Louis finding his first offers rejected, next proposed to march down his army to the frontiers of the Dutch provinces, and thus detain their forces at home for their own defence. But this proposal met with no better reception than the former one. Still Louis, unwilling to abandon a friend and ally whose interest he regarded as closely connected with his own, ventured to remonstrate with the Dutch against the preparations they were making to invade England. But the Dutch treated his remonstrances as an officious impertinence, and James himself declined his mediation.

The king of England, having thus rejected the assistance of his friends, and being left to face the danger alone, was astonished with an advice from his minister in Holland, that an invasion was not only projected, but avowed. When he first read the letter containing this information, he grew pale, and the letter dropt from his hand. He saw himself on the brink of destruction, and knew not to whom to apply for protection. In this emergency, Louis wrote to James in his own hand, that to divert the Dutch from their intended invasion of England, he would lay siege to Maestricht with thirty thousand men. James communicated this intelligence to Sunderland, and the latter to the Prince of Orange, by whom six thousand men were thrown into Maestricht; and the design of Louis being thus rendered impracticable, it was laid aside.

James had now no resource but in retreating from those precipitate measures which had plunged him into inextricable distress. He paid court to the Dutch, and offered to enter into any alliance with them for their common security. He replaced, in all the counties of England, the deputy lieutenants and justices who had been deprived of their commissions for their adherence to the test and penal law. He restored the charters of such corporations as he had possessed himself of, annulled the High Commission Court, reinstated the expelled president and fellows of Magdalen College, and even caressed the bishops whom he had so lately persecuted and insulted. But all these

concessions were now too late, and were regarded as the effects of fear, not of repentance.

In the mean time, William set sail from Helvoetsluys with a fleet of near five hundred sail, and an army of above fourteen thousand men. Fortune, however, seemed at first very unfavourable to his enterprise. He was driven back by a dreadful storm; but he soon refitted his fleet, and again set sail for England. It was given out that this invasion was designed for the coast of France; and many of the English, who saw the fleet pass along their coast, little suspected the place of its destination. It happened that the same wind which sent the Dutch to their place of destination, detained the English fleet in the river; so that the Dutch passed the Straits of Dover without molestation, and, after a voyage of two days, landed at Broxholme in Torbay, on the 5th of November 1688, the anniversary of the gunpowder treason.

But although the invitation from the English was general, the prince for some time had the mortification to find himself joined by very few. He continued for ten days in expectation of being joined by the malcontents, and at last was beginning to despair of success, and to deliberate about re-embarking his forces, when he was joined by several persons of consequence; and the whole country soon afterwards flocked to his standard. The first person who went over to the prince was Major Burrington, and he was quickly followed by the gentry of the counties of Devon and Somerset. Sir Edward Seymour made proposals for an association, which was signed by great numbers; and every day there appeared some new proof of that universal combination into which the nation had entered against the measures of the king. This was followed by the defection of the army. Lord Colchester, son to the Earl of Rivers, first deserted to the prince; Lord Cornbury, son to the Earl of Clarendon, carried off the greatest part of three regiments of cavalry at once; and several officers of distinction informed Feversham their general, that they could not in honour fight against the Prince of Orange. Soon after this the unhappy monarch found himself deserted by his own servants and creatures. Lord Churchill had been raised from the rank of page, and had been invested with a high command in the army; he had been created a peer, and owed his whole fortune to the king's bounty; yet even he deserted among the rest, and carried with him the Duke of Grafton, natural son to the late king, besides Colonel Berkeley and others.

In this universal defection, James, not knowing where to turn, began to think of requesting assistance from France, when it was now too late. He also wrote to Leopold, emperor of Germany; but that monarch only returned for answer, that what he had foreseen had happened. James had some dependence on his fleet; but in reality they were entirely disaffected. In a word, his interests were deserted by all, for he had long deserted them himself. His army, however, still amounted to twenty thousand men; and had he led them immediately to battle, it is possible they might then have fought in his favour. But his misfortunes had deprived him of his natural firmness and resolution; and seeing himself deserted by those in whom he thought he could place most confidence, he became suspicious of all, and was in a manner deprived even of the power of deliberation. In this extremity of distress, the Prince of Denmark, and Anne, James's favourite daughter, perceiving the desperation of his circumstances, resolved to take part with the Prince of Orange. Informed of this event, the king was stung with the most bitter anguish. "God help me," said he; "my own children have forsaken me." To add to his distress as a parent, he was accused of being accessory to the death of his own child.

On the 30th of November 1688, James dispatched three

Reign of
James II.

Reign of James II. noblemen to treat with the Prince of Orange. But though the latter knew very well that the king's commissioners were in his interests, his behaviour showed plainly that he now thought the period for treating was past. For some time he would not admit them to an audience; and when he did, he gave no satisfactory answer. James now began to be alarmed for his personal safety; but what most affected him was the terror of the queen for herself and her infant son. He therefore resolved to send them abroad. They crossed the river in a boat, at Whitehall, on a stormy day, and were carried to Gravesend in a coach, under the conduct of the Count de Lauzun; a yacht, commanded by Captain Gray, which lay there ready for the purpose, soon transported them in safety to Calais.

The king was now so dispirited and distracted, that he resolved to leave the kingdom at once, and thus plunge every thing in confusion. He threw the great seal into the Thames; he left none with any authority to conduct the government in his absence; and he vainly hoped to derive advantage to his affairs from anarchy and disorder. About twelve at night, on the 10th of December, he disguised himself, took a boat at Whitehall, and crossed the river. Sir Edward Hales, with another friend, met him at Vauxhall with horses. He mounted; and being conducted through by-ways by a guide, he passed in the night-time to the Medway, which he crossed by Aylesford-bridge. At Woolpeck he took fresh horses, sent thither before by Shelden, one of his equerries, who was in the secret of his flight. Having arrived at Embsferry near Feversham, he found a custom-house hoy, hired by Sir Edward Hales, lying ready to receive him on board. But the wind blew fresh, and the vessel had no ballast. The master, therefore, easily persuaded the king to permit him to take in some ballast at Shilness. It being half ebb when they ran ashore, they intended to sail as soon as the vessel should be afloat; but when the vessel was almost afloat, she was boarded by three fishing boats belonging to Feversham, containing fifty men, who seized the king and his two companions, under pretence of their being Papists who wanted to escape from the kingdom. They turned up Feversham water with the tide; but still the king remained unknown. Sir Edward Hales placed privately fifty guineas in the hands of the captain, as an earnest of more should he permit them to escape. He promised, but so far from keeping his word, he took what money they had, under pretence of securing it from the seamen; and having possessed himself of their all, left them to their fate. The unfortunate fugitives were at length carried in a coach to Feversham, amidst the insults, clamours, and shouts of the sailors. When the king was brought to the inn, a seaman who had served under him knew him, and melted into tears; and James himself was so much moved at this instance of his affection, that he wept. The other fishermen, who had previously treated him with indignity, when they saw his tears, fell upon their knees. The lower class of inhabitants gathered round him; but the better sort fled from his presence. The seamen, however, formed themselves into a guard, and declared, that "a hair of his head should not be touched." In the mean time, Sir James Oxendon, under pretence of guarding him from the rabble, came with the militia to prevent his escape. The king found a change in his condition when he was taken out of the hands of the sailors. The commanders of the militia showed him no respect; and he was even insulted by the common soldiers. A letter which he intended to send to London for clothes, a change of linen, and some money, were stopped by those who pretended to protect his person.

In the mean time the Prince of Orange exercised in his own person all the functions of royalty. He issued a de-

claration to the disbanded army to re-assemble themselves. He ordered the secretary at war to bring him a list of the king's troops. He commanded the Lord Churchill to collect his troop of horse guards. He sent the Duke of Grafton to take possession in his name of Tilbury Fort. The assembly of peers adjourned to the council-chamber at Whitehall, and, to give the appearance of legality to their meeting, chose the Marquis of Halifax as their president. Whilst this assembly was sitting, on the 13th of December, a poor countryman, who had been engaged by James, brought an open letter from that unfortunate prince to London. It had no subscription; and it was addressed to none. It described in one sentence only, his deplorable condition when in the hands of a desperate rabble. This poor messenger of a fallen sovereign waited long at the council door, without being able to attract the notice of any who passed; but when the Earl of Mulgrave became apprised of his business, his lordship had the courage to introduce him to the council. He delivered his open letter, and told the unhappy state of the king. The assembly were much moved, and sent the Earl of Feversham with two hundred of the guards towards Feversham. His instructions were first to rescue James from danger, and afterwards to attend him to the sea coast, should he wish to retire. He chose, however, to return to London; but the Prince of Orange sent a message to him, desiring him to approach no nearer the capital than Rochester. The messenger missed James by the way; and the king sent Feversham with a letter to the Prince of Orange, requesting his presence in London to settle the nation, while he himself proceeded thither, and arrived on the 16th of December.

The Prince of Orange received the news of his return with little satisfaction. His aim from the beginning was to force him by various means to relinquish the throne. The Dutch guards were ordered to take possession of Whitehall, and to displace the English; and the king was soon after commanded by a message, which he received in bed at midnight, to leave his palace next morning, and to depart for Ham, a seat of the Duchess of Lauderdale's. But he desired permission to retire to Rochester, which was readily granted. The harsh measures of the prince had now taken effect, and the king meditated an escape to France. Surrounded by the Dutch guards, he arrived at Rochester on the 19th of December. The restraint put upon his person, and the manner in which he had been forced from London, raised the indignation of many, and excited the compassion of all. The English army, both officers and soldiers, began to murmur; and had it not been for the timidity and precipitation of James himself, the nation would probably have returned to their allegiance. He remained three nights at Rochester, in the midst of a few faithful friends, the Earls of Arran, Dumbarton, Ailesbury, Litchfield, and Middleton, and, amongst other officers of merit, Lord Viscount Dundee. They all argued against his intended flight; and several bishops, some peers, and many officers, entreated his stay in some part of England. They represented that the opinions of men began to change, and that events would daily rise in favour of his authority. Dundee added his native ardour to his advice. "The question, Sir," said he, "is, Whether you shall stay in England or fly to France? Whether you shall trust the returning zeal of your native subjects, or rely on a foreign power? Here you ought to stand. Keep possession of a part, and the whole will submit by degrees. Resume the spirit of a king. Summon your subjects to their allegiance. Your army, though disbanded, is not dispersed. Give me your commission. I will gather ten thousand of your troops. I will carry your standard at their head through England, and drive before you the Dutch

Reign of James II.

Reign of James II. and their prince." The king replied, that he believed it might be done, but that it would raise a civil war, and he would not do so much mischief to a nation that would soon come to their senses again. Middleton urged his stay, though in the remotest part of the kingdom. "Your majesty," said he, "may throw things into confusion by your departure; but it will be but the anarchy of a month. A new government will soon be settled, and you and your family will be ruined."

These spirited remonstrances had no effect upon James. He resolved to quit the kingdom; and having communicated his design to a few of his friends, he left the house where he had lodged at midnight, accompanied by his son the Duke of Berwick, and went in a boat to a smack which lay waiting for him without the fort at Sheerness. In the morning of Tuesday the 25th December, the king landed at Ambletuse in France, and taking post, soon joined his consort at St Germain's.

James having thus abandoned his dominions, the Prince of Orange remained master of all. By the advice of the House of Lords, the only member of the legislature remaining, he was desired to summon a parliament by circular letters; but the prince, unwilling to act upon so imperfect an authority, convened all the members who had sat in the House of Commons during any parliament of Charles II., to whom were added the mayor, aldermen, and fifty of the common council of London; and being thus supported by an assembly deriving its authority from himself, he wrote circular letters to the counties and corporations of England, directing them to return members to this parliament or convention. When the house met, thanks were voted to the Prince of Orange for the deliverance he had wrought; after which they proceeded to settle the kingdom. A vote soon passed both houses, that King James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between the king and the people, and having by the advice of Jesuits and other wicked persons violated the fundamental laws, and withdrawn himself out of the kingdom, had abdicated the government; and that the throne was thereby vacant.

The king being thus deposed, it was easy for William to get himself appointed as his successor. Proposals were indeed made by some for electing a regent; and others were for investing the Princess of Orange with regal power, and declaring the young prince supposititious. But to these proposals William opposed the decisive argument, that he had been called over to defend the liberties of the British nation, and that he had happily effected his purpose; that he had heard of several schemes proposed for the establishing of the government; that, if they chose a regent, he thought it incumbent upon him to inform them that he would not be that regent; that he would not accept of the crown under the princess his wife, though he was convinced of her merits; that therefore, if either of these schemes was adopted, he could give them no assistance in the settlement of the nation, but would return home to his own country, satisfied with his aims to secure the freedom of theirs. Upon this, after a long debate in both houses, a new sovereign was preferred to a regent by a very small majority. It was agreed that the Prince and Princess of Orange should reign jointly as king and queen of England; whilst the administration of government should be placed in the hands of the prince only. The Marquis of Halifax, as Speaker of the House of Lords, made a solemn tender of the crown to their highnesses, in the name of the Peers and Commons of England. The prince accepted the offer; and that very day, the 13th of February 1689, William and Mary were proclaimed king and queen of England.

First measures of William.—National discontents.—Scheme in favour of the Dissenters rejected.—Precarious condition of William's government.—Proceedings in Scotland.—William acknowledged as King.—Attempts of Viscount Dundee in favour of James.—Battle of Killierankie, and death of Dundee.—State of Ireland.—Insurrection in favour of James.—The Protestants take arms in their own defence, and are defeated at Drumore.—Landing of James in Ireland.—Subsequent operations.—Gallant defence of Londonderry.—Odious measures resorted to by James.—Disembarkation of King William's army.—Its composition.—Arrival of William.—Battle of the Boyne, and defeat of James.—Battle of Aughrim, and defeat of St Ruth, James's General.—Siege of Limerick.—Pacification of Ireland.—Affairs of Scotland.—Massacre of Glenco.—Conduct of William respecting this atrocious barbarity.—The Dover expedition.—Violent discontents in Scotland, in consequence of the supposed perfidy of the King.—Plots in favour of James.—France declares in his favour.—Battle of La Hogue, and total defeat of the French fleet under Tourville.—James offered the crown of Poland, which he declined.—Offer by William to secure the succession to the Prince of Wales, James's son, also declined by him.—Death of James.—Conduct of Louis on this occasion.—The Pretender acknowledged by France as king of Great Britain and Ireland.—Death of Queen Mary.—National discontent.—William forced to disband his troops.—Altercations between the King and the Parliament.—Confederacy against France.—Death and Character of William.

William began his reign with issuing a proclamation for continuing in office all Protestants who had been in place on the first of the preceding December. On the 17th of the month he formed his privy council, which consisted chiefly of those persons who had been most active in raising him to the throne. To gratify as many as possible of his friends, the several boards, and even the chancery, were put into commission. The benches of the Exchequer and Common Pleas were filled with persons who had distinguished themselves against the measures of the late king. But the Earl of Nottingham, who had violently opposed the elevation of William, and the Earl of Shrewsbury, who had adhered to his views, were made secretaries of state. The Marquis of Halifax, and the Earl of Danby, though rivals in policy, were admitted into the cabinet; the first as lord privy seal, the second as president of the council. William's Dutch friends in the mean time were not forgotten by the king. Bentinck, his favourite, was made a privy counsellor, groom of the stole, and privy purse; Auverquerque was appointed master of the horse; Zuylstein received the office of master of the robes; and Schomberg was placed at the head of the ordnance.

Though these instances of gratitude were no doubt necessary to William, the generality of the nation were displeased. The Tories were offended at being excluded from favour, especially as they had departed from their usual principles in order to serve him. The nation in general were much prejudiced against foreigners, and universal discontent ensued upon seeing them preferred. The king, who had been bred a Calvinist, was also strongly inclined to favour that sect; and finding the clergy of the church of England but little inclined to take the oaths to the new government, he began openly to indulge his own prejudices in favour of dissenters. Having come to the House of Lords to pass some bills, on the 16th March, he made a speech, urging the necessity of admitting all Protestants indiscriminately into the public service. He informed them, that he was employed in filling up the vacancies in offices of trust; he expressed his hopes that they had become sensible of the necessity of a law to settle the oaths to be taken by such persons as should be admitted into place; and he doubted not, that whilst they

Reign of William and Mary. provided against Papists, they would at the same time leave room for the admission of all Protestants who were able and willing to serve their country. But this proposition was rejected with vehemence. The adherents of the church complained that the ruin which they feared from the Papists in the preceding reign was now to be dreaded from the Protestant dissenters; and they affirmed, that if the established religion was to be destroyed, it mattered little by whose hands it might fall. A bill brought in by the ministry for abrogating the former oaths of supremacy and allegiance was rejected; and an attempt to dispense with the sacramental test was made without success in another form. The court party proposed that any man, by producing a certificate of his having received the sacrament in any Protestant congregation, should be held sufficiently qualified for office. But this motion was also rejected in the House of Lords by a great majority. William repeated his attempts at a comprehension; but he was ultimately unsuccessful, and in the coronation-oath the church party inserted a clause, that the king should maintain the Protestant religion "as established by law."

For these and other reasons the government of William was for some time in a very tottering condition. The king, either through want of health or inclination, interfered but little in the affairs of the nation; Ireland was strangely neglected; whilst Halifax and Danby, who had in a manner raised the king to the throne, caballed with his enemies. They perceived that the people, with the same levity which had induced them to desert their former sovereign, were beginning to be discontented with their new prince. Every thing seemed to tend to a change. Halifax himself declared, that were James to conform with the Protestants, he could not be kept four months from re-ascending his throne; and Danby averred, that, were the late king to give satisfaction for the security of religion, it would be difficult to oppose his restoration. From these apparent discontents of the nation, the friends and emissaries of James assumed more boldness in tampering with the servants of the crown and inflaming the army. The former they alarmed with the prospect of a sudden change; the latter they roused into indignation by the alleged preference shown by William for his countrymen the Dutch.

Though the kingdom of Scotland did not at first recognise the authority of William, yet the party of James never attained sufficient strength to be of any effectual service to him in that kingdom. Thirty Scottish Peers, and near eighty gentlemen, then in London, had waited on the Prince of Orange in the beginning of January, and, without any authority from the regency still subsisting in Edinburgh, formed themselves into a kind of convention. The Prince of Orange in a formal manner asked their advice; and when he withdrew, they adjourned to the council chamber at Whitehall. The Duke of Hamilton being chosen president, explained the distracted state of Scotland, representing, that disorders, anarchy, and confusion prevailed, and urging the necessity of placing the power somewhere till a convention of estates should be called to form a lasting and solid settlement. When the heads of an address to the Prince of Orange had been settled, and ordered to be engrossed, the Earl of Arran unexpectedly arose, and proposed to invite back the king. The meeting, however, adhered to the Prince of Orange, and waited on him in a body, requesting him to take the administration into his own hands. He thanked them for the trust they had reposed in him; and a convention was ordered to meet at Edinburgh on the 14th of March, it being provided that no exception or limitation whatever should be made, except that the members should be Protestants.

This convention, however, was opposed by some of the

partisans of James; and the archbishop of Glasgow, the Earl of Balcarras, and the Viscount Dundee, were authorized by an instrument signed by him, at that time in Ireland, to call a convention of the estates at Stirling. But this measure was disappointed, first by the wavering disposition of the Marquis of Atholl, and afterwards by the procrastination and folly of the party. At last Viscount Dundee, pretending alarm on account of a design alleged to have been formed by the Covenanters to assassinate him, left Edinburgh at the head of fifty horse. As he passed under the walls of the castle, the Duke of Gordon, who then held the command of the fortress, and favoured the cause of James, called him to a conference. Dundee scrambled up the precipice, and informed the duke of his designs in favour of James, at the same time conjuring him to hold out the castle, under a certainty of being relieved. The novelty of the sight collected a multitude of spectators. The convention took the alarm. The president ordered the doors to be locked, and the keys to be laid upon the table. The drums beat to arms in the town; and a parcel of ill-armed retainers were gathered together in the street by the Earl of Leven. Dundee in the mean time rode off with his party. But as soon as they found themselves secure, the Duke of Hamilton adjourned the convention, which relieved the adherents of James from dreadful apprehensions for their own safety. Fifty members retired from Edinburgh; and that circumstance produced unanimity in all the succeeding resolutions of the convention. Soon after this it was determined in a committee that James had "forefaulted" his right to the crown, by which was meant that he had perpetually excluded himself and his whole race from the throne, which was thereby become vacant. This resolution being approved by the convention, another was drawn up raising William and Mary to the vacant throne; and in consequence they were publicly proclaimed at Edinburgh on the 11th of April 1689.

The castle of Edinburgh was still kept in the name of James by the Duke of Gordon; but despairing of any relief, and pressed by a siege, his Grace surrendered it on the 13th of June, upon honourable terms. The adherents of James, terrified at this unexpected misfortune, now turned their eyes to the Viscount Dundee, who having been in vain urged by the convention to return, was at length declared a fugitive, an outlaw, and a rebel. General Mackay had been sent to Scotland by William, with four regiments of foot and one of dragoons. But Dundee, apprised of the general's design to surprise him, retired to the Grampian Mountains with a few horse, and thence marched to Gordon Castle, where he was joined by the Earl of Dunfermline with fifty gentlemen. He next passed through the county of Moray to Inverness, which Macdonald of Keppoch had invested with seven hundred men, after having ravaged the lands of the clan of Mackintosh in his way from his own country. Dundee promised to the magistrates of Inverness to repay, at the king's return, the money extorted from them by Macdonald, and thus induced the latter to join him with all his men. But as he could not prevent the Highlanders from first returning home with their spoil, he accompanied them to Lochaber, and on the 8th of May arrived in Badenoch, whence he wrote letters to the chiefs of the different clans, appointing them to meet at a general rendezvous in Lochaber on the 18th of the same month. In the mean time, passing suddenly through Athole, he surprised the town of Perth, and hoping to gain over two troops of Scottish dragoons who lay at Dundee, he marched suddenly to that place; but the fidelity of Captain Balfour, their commander, disappointed his views. Dundee then returned through Athole and Rannoch to hold the diet of rendezvous at Lochaber; and

Reign of
William
and Mary.

there he was reinforced by several Highland chieftains, so that his little army was increased to about fifteen hundred men. He now turned against Mackay, who had advanced to Inverness, but on the approach of Dundee retreated to Strathbogie, leaving the whole Highlands exposed to the enemy.

But notwithstanding this partial success, Dundee found himself surrounded with many difficulties. The officers of the Scottish dragoons, who maintained a secret correspondence with him, sent him false intelligence, as an excuse for their own fears, informing him that a party of Irish, who had endeavoured to land in Scotland under the Duke of Berwick, were driven back, and the duke himself taken prisoner; and that Mackay had been reinforced with a regiment of English horse, and another of foot. Crediting this information, Dundee retreated to Badenoch; the natives of the low country who served in his little army quitted him without leave; the Highlanders plundered the country wherever they went; and he himself at last fell sick, while Mackay hovered on his rear. A slight skirmish occurred, in which the Highlanders had the advantage; but they nevertheless lost their baggage during the action. Dundee at length arrived at Ruthven; but Mackay, reinforced with a body of twelve hundred men, advanced against him, and other regiments had arrived at Perth and Dumblane, on their way to join. The Highlanders now deserted every night by hundreds, and their leader was forced to retire to Lochaber, where only two hundred of his whole force remained with him; whilst, to complete his misfortunes, he at the same time received intelligence of the surrender of the castle of Edinburgh.

Meanwhile, letters having arrived from King James promising immediate succours from Ireland, Dundee ordered the neighbouring clans to assemble round his standard. But still he wanted the necessary means for prosecuting the war. The Highlanders were armed only with their own proper weapons, and he had no more than forty pounds weight of powder in his whole army. All difficulties, however, were surmounted by the activity of the general, for whom his army entertained an enthusiastic zeal. Having collected a force of about two thousand five hundred men, including three hundred Irish recruits, he resolved to give battle to Mackay, who, with a force considerably superior in numbers, was advancing against him. The encounter took place on the 17th of July 1689, near the head of the Pass of Killikrankie. The Highlanders took post on the face of a hill, a little above the house of Urrard, and to the westward of the great Pass; whilst the king's forces were drawn up on a level piece of ground, in the form of an amphitheatre, bounded on two sides by the heights, and on the third by the river Garry. Dundee delayed his attack until about sunset, when suddenly the Highlanders rushed down like furies, covering themselves from the fire of the king's troops with their targets. "At last," says an eye-witness, "they cast away their muskets, drew their broadswords, and advancing furiously on the king's troops, broke them, and obliged them to retreat; some flying to the water, some another way." The charge was like a torrent, fierce, rapid, irresistible; and the rout complete. The 21st or Scotch fusiliers was on the left of General Mackay's front line, Hastings' and Leslie's, now the 13th and 15th regiments, in the centre, and Lord Leven's, now the 25th, on the right; the whole consisting of two regiments of cavalry and nine battalions of infantry. After the right of the line had given way, the regiments on the centre and the left, which were covered by the river Garry and the woody precipice below the house of Urrard, kept their ground, and for a short time withstood the shock of the Highland charge with the broadsword; but at length they gave way on all sides, Hast-

ings' flying through the Pass on the north side, and the fusiliers dashing across the river, followed by the Highlanders. But Dundee having fallen early in the attack, the consternation occasioned by his death prevented an immediate pursuit through the great Pass. Had they been closely followed, and had a few men been placed at the southern entrance, not a man of the king's troops would have escaped to tell the story of their defeat. As it was, they lost nearly two thousand men, and the remainder were completely broken and dispersed. But the victory, though gallantly achieved, was productive of nothing but barren glory; and with the fall of Dundee ended all the hopes of James in Scotland. Colonel Cannon, who succeeded him in the command, possessed neither his popularity nor his abilities. After some insignificant actions, in which the valour of the soldiers was more conspicuous than the conduct of their leader, the Highlanders dispersed in disgust; and the war soon afterwards ended favourably for William, without the trouble of repulsing his enemies.

During the troubles in England, which had terminated in placing William on the throne, the two parties in Ireland were kept in a kind of tranquillity by their mutual fears. The Protestants were terrified at the prospect of another massacre; and the Catholics expected every day to be invaded by the united force of the English and Dutch. Their terrors, however, were ill founded; for although Tyrconnel sent several messages to the prince, stating his readiness to deliver up the kingdom to any force that might make a surrender decent, his offers were always rejected. This is said to have been owing to Halifax, who is alleged to have represented to the king, that if Ireland yielded, no pretence would remain for keeping an army in pay; that without an army to protect his authority, he might be as easily turned out as he had been brought in; that the English nation could never remain long in a state of contentment; and that they had already begun to show symptoms of strong disaffection with the new government.

Tyrconnel, disappointed in his views of surrendering Ireland to the Prince of Orange, affected to adhere to King James. The whole military force of the kingdom at that time amounted only to four thousand men, and of these six hundred were in Dublin; whilst all of them were so much disposed to quit the service, that the lord-deputy was obliged to issue commissions for levying new forces. The effect of this was, that there suddenly appeared in various parts of the kingdom a half-armed rabble, who, having no pay from the king, subsisted by depredation, and disregarded all discipline. The Protestants in the north armed themselves in their own defence; and the city of Londonderry, relying on its situation, and a slight wall, shut its gates against the newly-raised army. Protestant parties also appeared everywhere, declaring their resolution to unite in self-defence, to preserve the Protestant religion, to continue their dependence on England, and to promote the meeting of a free parliament.

In these circumstances William sent General Hamilton, an Irishman and a Roman Catholic, to treat with Tyrconnel; but instead of persuading that lord to yield to William, Hamilton advised him to adhere to James. In the mean time James himself assured the lord-deputy that he was ready to sail from Brest with a powerful armament; upon which Hamilton marched against the northern insurgents, who were routed with considerable slaughter at Drumore, whilst Hillsborough, where they had fixed their head-quarters, was taken without resistance. The city of Londonderry, however, resolved to hold out to the last extremity.

On the 7th of March 1689, James embarked at Brest.

Reign of
William
and Mary. The whole force of his expedition consisted of fourteen ships of war; six frigates, and three fire-ships; whilst twelve hundred of his native subjects in the pay of France, and a hundred French officers, composed his army. He landed at Kinsale without opposition on the 12th of the month; and his first care was to secure, in the fort, the money, arms, and ammunition which he had brought from France, and to put the town in some posture of defence. This done, he advanced to Cork, where Tyrconnel arrived soon after, and brought intelligence of the rout at Drumore. The king was so much pleased with his attachment and services, that he created him a duke, and then began his advance towards Dublin. But the condition of the rabble who flocked to his standard was not calculated to raise his hopes of success. Their very numbers distressed their sovereign, and ruined the country; insomuch that James resolved to disband the greatest part of them. More than one hundred thousand were already on foot in the different parts of the island. Of these he reserved fourteen regiments of horse and dragoons, and thirty-five regiments of foot; the rest he ordered to their respective homes, and armed those who were retained in the best manner he could.

On reaching Dublin, James immediately proceeded to business. He ordered all Protestants who had abandoned the kingdom to return; he commanded all Papists, except those in his army, to lay aside their arms, and put an end to the depredations which they had committed in the excess of their zeal; he raised the value of the currency by proclamation; and he summoned a parliament to meet on the 7th of May, in order to settle the affairs of the kingdom. The Protestant clergy represented their grievances in an address; and the university of Dublin appeared with complaints and congratulations. He assured the first of his absolute protection, and a full redress; and he promised the latter not only to defend, but even to enlarge, their privileges.

On the 8th of April he left Dublin, resolving to lead his army against the insurgents in person; but as they retired before him, he resolved to lay siege to Londonderry. The place, however, made a vigorous resistance; but being reduced to the last extremity, it would have been obliged to surrender had it not been relieved on the 28th of July by seven ships laden with provisions, upon which the siege was immediately raised. In the mean time, the distressed situation of James, and his absolute dependence upon France, drove him to the adoption of measures equally odious and impolitic. His soldiers had for some time been supported by their officers, or subsisted by depredation. But the funds of the officers were at length exhausted, and the country itself could no longer endure the riot and injustice of the soldiers. Pressed by these difficulties, he resolved, by the advice of his council, to coin copper pieces, which should be received in lieu of silver. The inconveniences and iniquity of this measure were obvious; but all Ireland possessed not the means of paying the army in current coin till the middle of June. Of the French remittances only 200,000 livres remained; and the king found it absolutely necessary to reserve that sum, in order to forward his measures regarding Britain, and to procure intelligence of the motions of his enemies. The army was satisfied even with this mock semblance of money, and the people received the fictitious coin in hopes of being repaid in a more favourable state of affairs. A tax of £20,000 a month, granted for thirteen months by the parliament, furnished government with an appearance of resources; and in the mean time the king endeavoured to support the former revenue by opening a trade with France to supply the want of commerce with England.

To add to the distress of James, Ireland was now invaded by ten thousand men under the command of the Duke of Schomberg. On the 12th of August 1689, they appeared in ninety transports, on the coast of Donaghadee, in the county of Down; and next day Schomberg landed his army, horses, and train of artillery, without opposition. On the 15th he marched to Belfast, and continued in that place four days to refresh his troops. He then invested Carrickfergus, and threw into it a thousand bombs, which laid the houses in ashes. When the garrison had expended their powder to the last barrel, they marched out with all the honours of war; but Schomberg's soldiers broke the capitulation, disarmed and stripped the inhabitants, without regard to sex or quality, and perpetrated many disgraceful cruelties by way of retaliation on the Papists. Schomberg was an experienced general, who had passed a life of eighty years almost continually in the field; yet he found himself at a loss how to carry on the war with Ireland. Not considering the dangers which threatened the health of his troops by confining them too long in one place, he kept them encamped in a low damp situation near Dundalk, almost without fuel; the consequence of which was, that the men were seized with fevers and fluxes, and died in great numbers. Nor were the enemy less afflicted with similar disorders. In both camps sickness prevailed; and as the rainy season was now approaching, the hostile armies, after remaining for some time in sight of each other, quitted their camps at the same time, and retired into winter quarters.

The ill success of this campaign, and the miserable situation of the Protestants in Ireland, at length induced William to attempt their relief in person. Accordingly, he left London on the 4th of June 1690, and arrived on the 14th at Carrickfergus; whence he passed to Lisburn, the head-quarters of the Duke of Schomberg. At Lough-Britland he reviewed his army, which amounted to thirty-six thousand men, consisting of English, Dutch, Germans, Danes, and French; and being supplied with every necessary, as well as in high health and spirits, they seemed certain of victory. The Irish army abandoned Ardee at their approach, and fell back to the south of the Boyne, where they were joined by James, who had marched from Dublin at the head of his French auxiliaries. The banks of the Boyne were precipitous, and on the south side the ground was hilly, and intersected with ditches. The river itself was deep, and it rose to a considerable height in consequence of the tide. These advantages induced James, contrary to the opinion of his officers, to maintain possession of this post. His army was inferior in numbers, in discipline, and in every other quality, to that of his adversary; but convinced that a retreat would dispirit his troops, and tarnish his own reputation, he resolved to put the fate of Ireland on the issue of a battle. William had no sooner arrived on the ground than he rode along the river in sight of both armies, to examine the position of the hostile force, and make proper dispositions for battle; but being observed by the enemy, a cannon was privately brought out and pointed against the spot where for the moment he stood. The shot killed several of his followers, and he himself was slightly wounded in the shoulder. The report of his being slain was instantly propagated throughout the Irish camp, and even transmitted to Paris; but as soon as his wound was dressed, William rode through the camp, and quickly undeceived his army. The next day, being the 30th of June, the battle began at six o'clock in the morning. William directed the river to be forded in three different places, and the attack to be simultaneously commenced from as many points. Schomberg, with the right wing, consisting of ten thousand men, passed the fords up the river, traversed a bog on the opposite side, and attacked

Reign of
William
and Mary.

with great impetuosity the left of James, which, after a short resistance, gave way, and retired precipitately to secure the Pass of Dunleck, which formed the only line of retreat. The centre next crossed the river, but were gallantly opposed by the French and Irish, with whom they maintained a doubtful contest, till William, passing the river farther down at the head of his cavalry, threatened the enemy's flank, and forced them to fall back on the rest of the army of James, which was retiring in a body around their king. The left met with little or no resistance from the force opposed to them; and, indeed, the whole of James's dispositions seem to have been made for retreat rather than for battle. Hence, with a comparatively small loss, William succeeded in forcing his position at all points, and in establishing his whole army on the opposite bank of this deep and difficult river. Whilst the armies were yet engaged, James, who had so often shown the most heroic courage in battle, rode ingloriously off the field. This dispirited his troops, who fell into irretrievable disorder, and fled in all directions, neglecting his injunction to defend the Pass of Dunleck, and leaving nearly two thousand men killed and wounded on the field. The loss sustained by William's army was, owing to the difficult nature of the ground, considerably greater, though much inferior to what it would have been if James had skilfully availed himself of the strength of his position, and headed the columns of attack as they debouched from the fords. Among the slain was the brave Duke of Schomberg. He was killed by a discharge from his own troops, who, not knowing that he had been accidentally hurried into the midst of the enemy, fired upon the body of men who surrounded him. When James first deserted his troops, O'Regan, an old Irish captain, was heard to observe, that if the English would exchange generals, the conquered army would fight them over again. James withdrew precipitately to Waterford, where he immediately embarked for France.

But the victory at the Boyne was by no means decisive, and the adherents of James resolved to continue their opposition. Sarsfield, a popular and experienced general, put himself at the head of the army which had been routed at the Boyne, and took measures for defending the banks of the Shannon. But James superseded him in the command, which he conferred on St Ruth, a proceeding which gave great dissatisfaction to the Irish. On the other hand, General Ginckel, who had been appointed to command the English army in the absence of William, who had gone over to England, advanced towards the Shannon to meet the enemy. The only place where the river was fordable was at Athlone, a strong walled town, situated on both banks of the river, and in the possession of King James's party. The English soon made themselves masters of that part which was on the one side of the river; but the part on the opposite bank being defended with great vigour, it was resolved in a council of war that a forlorn hope should ford the stream in the face of the enemy; and this desperate enterprise being performed with great resolution, the enemy were driven from their works, and the town surrendered at discretion. St Ruth marched to its relief, but he came too late, and, as he approached, his own guns were turned against him. Upon this he instantly counter-marched, and took post at Aughrim, ten miles distant, where he determined to wait the English army. Ginckel, though he had only eighteen thousand men, whilst the Irish were above twenty-five thousand strong, did not decline the combat. A fierce contest ensued; but St Ruth having fallen, his troops gave way on all sides, and retreated in disorder to Limerick, where they determined to make a final stand, after having lost near five thousand of their best men.

Ginckel, wishing to put an end to the war at once, suf-

fered as many of the Irish as chose, to retire to Limerick. In this last retreat, however, the Irish forces made a brave defence. The siege commenced on the 25th of August 1691; and six weeks were spent before the place without any decisive effect. The garrison was well supplied with provisions, and provided with all means of defence. On the other hand, the winter was approaching, and Ginckel had orders to finish the war upon any terms. Accordingly, he offered conditions to the Irish, which, even had they been victors, they could scarcely have refused with prudence. He agreed that all persons in arms should be pardoned; that their estates should be restored, their attainders annulled, and their outlawries reversed; that none should be liable for debts incurred through deeds done in the course of hostilities; that all Roman Catholics should enjoy the same toleration in regard to their religion as in the reign of Charles II.; that the gentry should be permitted to retain their arms; that the inferior class should be allowed to exercise their various callings and professions; that no oath but that of allegiance should be required of any one; and that if the troops, or any number of them, should choose to enter into any foreign service, they should be conveyed to the Continent at the expense of the king. Sarsfield, who had obtained the title of Earl of Lucan from James after his abdication, was permitted to retain a dignity which the laws could not recognise. The lords justices having arrived from Dublin on the 1st of October, signed the articles along with Ginckel, and thus the Irish Catholics put a period to a war which threatened their party with absolute ruin. In consequence of this treaty, about fourteen thousand of those who had fought for King James passed over to France in transports provided by government for conveying them thither; and in this manner all James's expectations from Ireland were entirely frustrated, and the kingdom submitted quietly to the English government.

In the beginning of the year 1692 an action of unexampled barbarity disgraced the government of William in Scotland. In the August preceding, a proclamation had been issued, offering an indemnity to such insurgents as should take the oaths to the king and queen on or before the last day of December; and the chiefs of such tribes as had been in arms for James soon after took advantage of the proclamation. But Macdonald of Glenco was prevented by accident rather than design from tendering his submission within the limited time. In the end of December he went to Colonel Hill, who commanded the garrison in Fort William, to take the oaths of allegiance to the government; and the latter having furnished him with a letter to Sir Colin Campbell, sheriff of the county of Argyle, directed him to repair immediately to Inverary to make his submission in a legal manner before that magistrate. But the way to Inverary lay through almost impassable mountains, the season was extremely rigorous, and the whole country was covered with a deep snow. Soeager, however, was Macdonald to take the oaths before the limited time should expire, that, though the road lay within half a mile of his own house, he stopped not to visit his family, and, after various obstructions, arrived at Inverary. The time had elapsed, and the sheriff hesitated to receive his submission; but Macdonald prevailed by his importunities, and even tears, in inducing that functionary to administer to him the oath of allegiance, and to certify the cause of his delay. At this time Sir John Dalrymple, afterwards Earl of Stair, being in attendance upon William as secretary of state for Scotland, took advantage of Macdonald's neglecting to take the oaths within the time prescribed, and procured from the king a warrant of military execution against that chief and his whole clan. This was done at the instigation of the Earl of Breadalbane, whose

and Mary.

lands the Glenco men had plundered, and whose treachery to government in negotiating with the Highland clans Macdonald had himself exposed. The king was accordingly persuaded that Glenco was the main obstacle to the pacification of the Highlands; and the fact of the unfortunate chief's submission having been concealed, the sanguinary orders for proceeding to military execution against his clan were in consequence obtained. The warrant was both signed and countersigned by the king's own hand; and the secretary urged the officers who commanded in the Highlands to execute their orders with the utmost rigour. Campbell of Glenlyon, a captain in Argyll's regiment, and two subalterns, were ordered to repair to Glenco on the first of February with a hundred and twenty men. Campbell, being uncle to young Macdonald's wife, was received by the father with all manner of friendship and hospitality. The men were lodged at free quarters in the houses of his tenants, and received the kindest entertainment. Till the 13th of the month the troops lived in the utmost harmony and familiarity with the people; and on the very night of the massacre the officers passed the evening at cards in Macdonald's house. In the night Lieutenant Lindsay, with a party of soldiers, called in a friendly manner at his door, and was instantly admitted. Macdonald, while in the act of rising to receive his guest, was shot dead through the back with two bullets. His wife had already dressed; but she was stripped naked by the soldiers, who tore the rings off her fingers with their teeth. The slaughter now became general, and neither age nor infirmity was spared. Some women, in defending their children, were killed; boys, imploring mercy, were shot dead by officers on whose knees they hung. In one place nine persons, as they sat enjoying themselves at table, were butchered by the soldiers. In Inverriggon, Campbell's own quarters, nine men were first bound by the soldiers, and then shot at intervals, one by one. Nearly forty persons were massacred by the troops; and several who fled to the mountains perished by famine and the inclemency of the season. Those who escaped owed their lives to a tempestuous night. Lieutenant-colonel Hamilton, who had received the charge of the execution from Dalrymple, was on his march with four hundred men, to guard all the passes from the valley of Glenco; but he was obliged to stop by the severity of the weather, which proved the safety of the unfortunate clan. Next day he entered the valley, laid the houses in ashes, and carried away the cattle and spoil, which were divided among the officers and soldiers.

It can scarcely be imagined that a massacre attended with circumstances of such unparalleled treachery and cruelty could pass without some animadversion at the time, or escape the indignant reprobation of history afterwards. However willing we may be to ascribe to the immediate agents in this horrid business all that is most revolting and hideous in the execution of the sanguinary warrant obtained by Secretary Dalrymple at the instigation of Breadalbane, and to transfer to them a large share of the guilt and odium which will ever attach to it, still, after all allowances are made, it is impossible to exculpate William from knowingly consenting to a proceeding which nothing but dire necessity could ever justify. That he was beset by sanguinary ministers, and kept in ignorance of the fact of Macdonald's submission, may be readily admitted; but it will also be observed that he signed and countersigned an order for exterminating a whole clan without instituting any previous inquiry; and that afterwards, when the truth became known, no punishment was inflicted on the instigators of the massacre. Besides, the extraordinary precaution of Secretary Dalrymple in requiring the king to countersign the order to which he had already affixed

his sign-manual, a thing altogether unusual and unprecedented, might well have excited suspicion in the mind of William; nor, with the knowledge of this fact, coupled with the neglect of all inquiry in the first instance, and the impunity of the instigators of the crime afterwards, is it easy to believe that this otherwise excellent prince was altogether free of guilty participation in the foul and bloody tragedy of Glenco.

To efface the remembrance of this massacre, and to blink the inquiry which had been commenced, the king now caused his commissioner to declare in the Scottish parliament, "That if the members found it would tend to the advancement of trade that an act should be passed for the encouragement of such as should acquire and establish a plantation in Africa, America, or any other part of the world where plantations might be lawfully acquired, that his majesty was willing to declare he would grant to the subjects of this kingdom, in favour of these plantations, such rights and privileges as he granted in like cases to the subjects of his other dominions." Relying on this and other flattering promises, the nobility and gentry of Scotland advanced L.400,000 towards the establishment of a company for carrying on an East and West India trade; and twelve hundred veterans who had served in King William's wars were sent to effect a settlement on the isthmus of Darien or Panama, which, from its situation, was equally adapted for trading with both the Indies. The new colony was well received by the natives, and matters began to wear a promising aspect, when the king, at the earnest solicitations of the English and Dutch East India Companies, resolved to gratify the latter at the expense of his Scottish subjects, and sent orders to the governor of Jamaica and the English settlements in America to issue proclamations, prohibiting, under the severest penalties, all his majesty's subjects from holding any correspondence with the Scottish colony, or assisting it in any way with arms, ammunition, or provisions. Thus the new settlers were abandoned to their fate, although many of them had been covered with wounds in fighting the king's battles; and thus vanished all the hopes of the Scottish nation, which had engaged in the design with incredible alacrity, and with sanguine expectations that the misfortunes of their country would, by this new channel of commerce, be completely healed. The distresses of the people, upon receiving authentic accounts of the fortune of their colony, scarcely admit of any description; and the whole nation joined in reproaching their sovereign with double dealing, inhumanity, and base ingratitude, to a people who had lavished their treasure and best blood in support of his government, and in the gratification of his ambition.

But the total reduction of Ireland, and the dispersion and extermination of the Highland chieftains who favoured his cause, did not entirely put an end to the hopes of James. His chief expectations were founded on a conspiracy among his English adherents, and in the succours promised him by the French king. A plot was first formed in Scotland by Sir James Montgomery, a person who, from being an adherent of William's, now turned against him; but as the project was ill contrived, so it was as lightly discovered by the instigator. To this succeeded another, which seemed to threaten more serious consequences, as it was managed by the Whig party, the most formidable in the state, a number of whom joined themselves to the Tories, and made advances to the late king. They assembled together; and, in order to lose no time, it was resolved to send over to France two trusty persons, Lord Preston and Mr Ashton, to consult with the exiled monarch. Both of them, however, were seized by order of Lord Caermarthen, and condemned. Ashton was executed without making any confession; but Lord Preston

William
and Mary.

wanted equal virtue or resolution, for on an offer of pardon, he discovered a great number of associates, amongst whom were the Duke of Ormond, Lord Dartmouth, and Lord Clarendon.

The French having at last become sensible of their bad policy in not better supporting the cause of James, resolved to attempt a descent upon England in his favour; and, in pursuance of this scheme, James was supplied with an army consisting of a body of French troops, some English and Scottish refugees, and the Irish regiments which had been transported into France from Limerick, and by long discipline and severe duty had become excellent soldiers. This army was assembled between Cherbourg and La Hogue, and commanded by King James in person. More than three hundred transports were provided for landing the expedition on the opposite coast; and Tourville, the French admiral, at the head of sixty-three ships of the line, was appointed to favour the descent; his orders being at all events to attack the enemy in case they should oppose him. Every thing therefore promised a change of fortune to the exiled king, and he might now entertain hopes of recovering his crown. But these preparations on the side of France were soon known at the English court, and measures taken for a vigorous and effective resistance. The secret machinations of the banished king's adherents were discovered to the English ministry by spies; and it was thus found that the Tories were more faithful than even the Whigs, who had placed King William on the throne. The Duke of Marlborough, Lord Godolphin, and even the Princess Anne herself, were violently suspected of disaffection.

Preparations, however, were made with great tranquillity and resolution, to resist the coming storm. Admiral Russell was ordered to put to sea with all possible expedition; and he soon appeared with ninety-nine ships of the line, besides frigates and fire-ships. At the head of this formidable fleet he set sail for the coast of France; and, near La Hogue, he discovered the enemy under Tourville, who prepared to give him battle. The engagement began between the two flag ships with the greatest fury, and the rest of the ships in succession followed their example. The battle lasted ten hours; but at length victory declared in favour of numbers, and the French fled for Conquet road, having lost four ships in the action. The pursuit continued for the two days following. Three French ships of the line were destroyed on the day succeeding the principal conflict; and eighteen more, which had taken refuge in the bay of La Hogue, were burnt by Sir George Rooke. The ships were drawn up in the shallows, and seemed to be secure against attack; but nothing could resist the bravery and enterprise of the British seamen, who, crowding in barges, under cover of such frigates as could be brought sufficiently near, boarded the enemy's ships, overpowered their crews, and then set them on fire. When James beheld his late subjects thus daringly occupied in completing the destruction of the French fleet, he could not restrain his admiration of their gallantry; and, whilst witnessing the wreck of all his hopes, exclaimed, "Ah, none but my brave English could do this." And thus were frustrated the preparations of France, which from this time seemed to relinquish all claims to the empire of the ocean.

The battle of La Hogue, which took place on the 21st of May 1692, put a final period to the hopes of James. No further attempts were made in his favour, except some plots to assassinate King William, which ended only in the destruction of those who had formed them. But it was never thoroughly proved that James countenanced these designs; and it rather appears that he expressed abhorrence of such attempts. In 1697 the Abbé de Polignac,

ambassador of France to Poland, wrote to his master that thoughts were entertained of the late king of Britain in the new election which happened on the death of John Sobieski; and that James had already been named by some of the diet as his successor. Louis was eager to seize an opportunity of ridding himself with honour of a prince whose pretensions he could no longer support; and the friends of James were also sanguine as to the project; but he himself refused it. The same year, at an interview between King William and Louis XIV. it was proposed that the Prince of Wales, James's son, should succeed to the throne of England after the death of William. William with little hesitation agreed to this request, and even engaged to procure the repeal of the act of settlement, and the passing of another declaring the Prince of Wales his successor to the throne. But this proposal was also rejected by James. He told the king of France, that though he could endure with patience the usurpation of his nephew, he would never permit his own son to be guilty of the same injustice; that should his son reign in his father's life-time, that circumstance would amount to a formal renunciation; and that the Prince of Wales, by succeeding to the Prince of Orange, would thereby yield his sole right, which devolved to him through his father alone.

From this time James lost every hope of being restored to the throne, and resigned himself entirely to religious austerities. His constitution, though vigorous and athletic, had for some time begun to yield to the infirmities of age, and to that melancholy which superstition, uniting with misfortune, had impressed on his mind. In the beginning of September 1701, whilst he was at public prayers, according to his daily custom, he fell suddenly into a lethargy; and though he recovered his senses soon after, he languished for some days, and expired on the 6th of September. The French king paid him several visits during his sickness, and exhibited every symptom of compassion, affection, and even respect.

Embarrassed as to how he ought to proceed upon the unexpected death of James, Louis called a council to deliberate whether he should acknowledge the Prince of Wales as king of Great Britain and Ireland. The king himself had hesitated long in this delicate point; but the Dauphin, the Duke of Burgundy, and all the princes of the blood, declared that it would be unbecoming the dignity of the crown of France not to own that the titles of the father had devolved immediately on the son. Louis approved of this view, and determined in person to acquaint the dying king with his resolution. When he arrived at St Germain, James lay almost insensible from his disorder; but rousing himself, he began to thank his most Christian majesty for all his favours. Louis, however, interrupted him: "Sir," said he, "what I have done is but a small matter; but what I have to say is of the utmost importance." The people then began to retire, but Louis ordered them to remain. "I come to acquaint you, Sir," he added, "that when God shall please to call your majesty from this world, I shall take your family under my protection, and acknowledge your son as king of Great Britain and Ireland."

Though the defeat of the French fleet at La Hogue had put an end to all danger of any further attempt from that quarter, William by no means possessed his throne in any degree of tranquillity. The want of a common enemy produced dissensions amongst the people, and the king began to experience as much trouble from his parliament at home as from any enemy in the field. The uneasiness he felt on account of the refractory disposition of his subjects was not a little heightened by the death of his queen, who was carried off by the small-pox on the 28th of December 1694. The grief he felt for her loss

Reign of
William
and Mar

was deep and sincere; but all private concerns were soon merged in the greatness of his apprehensions for the balance of power and the fluctuating interests of Europe. William's chief motive for accepting the crown had been to engage England more deeply in the concerns of Europe; and as his great object had been to humble the French, so his politics mainly consisted in forming alliances against France. But many of the English had no such animosity against that country; and considering the interest of the nation as sacrificed to foreign connections, they complained that the continental war fell most heavily on them, though they had the least interest in its success. These complaints were at first heard by William with indifference; and he continued to bestow all his attention on the balance of power and the interests of Europe. But in attending to foreign affairs he overlooked internal polity; and, as he formed alliances abroad, he increased the influence of party at home. In accepting the crown, William had resolved to preserve as much of the prerogative as could decently be retained; and he sometimes exerted a branch of it, the power of refusing his assent to bills which had passed both houses, with equal firmness and decision. Hence perpetual bickerings took place between him and his parliaments. But William at last became fatigued with opposition, and admitted every restraint which they chose to impose on the prerogative in England, upon condition of being properly supplied with the means necessary for humbling France.

The war with France continued during the greatest part of this king's reign; but at length the treaty of Ryswick, in 1697, put an end to a contest in which England had engaged without policy, and from which she came off without advantage. In the general pacification her interests seemed entirely neglected; and for all the treasures she had transmitted to the Continent, and all the blood which had been shed there, the only equivalent received was an acknowledgment of William's title by the king of France.

The king being now freed from foreign war, set himself to strengthen his authority at home; and as he could not endure the thoughts of a king without an army, he conceived hopes of keeping up, in time of peace, those forces which had been granted him during the time of danger. The Commons, however, to his great mortification, passed a vote that all the forces in the pay of England, exceeding seven thousand men, should be forthwith disbanded, and that those retained should be natural-born subjects of England. At this vote the king's indignation was kindled to such a degree, that he actually conceived a design of abandoning the government. From this, however, his ministers diverted him, and persuaded him to consent to the passing of the bill.

These altercations continued during the remainder of this reign. William considered the Commons as a body of men desirous of power for themselves, and consequently bent upon obstructing all his projects for securing the liberties of Europe; and he seemed but little attached to any particular party in the house, all of whom he found at times deserted or opposed him. He therefore inclined to Whigs and Tories indiscriminately, as interest or the immediate exigency demanded. He considered England as a place of labour, anxiety, and altercation. If he had any time for amusement or relaxation, he retired to Loo in Holland, where, among a few friends, he indulged in such festivities as he was capable of relishing. Here he planned the succession of the different princes of Europe, and laboured to undermine the schemes and the power of Louis, his rival in politics and fame. But however feeble might be William's desire of other amusements, he could scarcely exist without being at variance with France. Peace had hardly been concluded with that nation when

he began to think of resources for carrying on a new war, and enlisting his English subjects in a confederacy against France. Several arts were used for inducing the people to second his aims; and the whole nation seemed at last to join in desiring a French war. He had been in Holland concerting with his allies operations for a new campaign; and he had entered into a negotiation with the Prince of Hesse, who assured him that if he would besiege and take Cadiz, the admiral of Castile and several other grandees of Spain would declare for the house of Austria. The Elector of Hanover had concurred in the same measures; the king of the Romans, and Prince Louis of Baden, undertook to invest Landau; and the emperor promised to send a powerful reinforcement into Italy. But death unexpectedly put a period to the projects and ambition of this prince, who, with all his defects, was, in many particulars, a truly great man.

William was naturally of a very feeble constitution; and by this time it had become almost quite exhausted by a series of continual disquietude and action. He had endeavoured to repair his strength, or at least to conceal its decay, by exercise on horseback. But on the 21st of February 1702, whilst riding to Hampton Court from Kensington, his horse fell under him, and he was thrown with such violence that his collar-bone was fractured. His attendants conveyed him to the palace at Hampton Court, where the fracture was reduced; and in the evening he returned to Kensington in his coach. But the jolting of the carriage disunited the fracture; and although the bones were again replaced by Bidloo his physician, this accident proved ultimately fatal. For some time indeed he appeared to be in a fair way of recovery; but falling asleep in his couch, he was seized with a shivering, which terminated in a fever and diarrhoea, that resisted all remedial means employed to abate them. Perceiving his end approaching, he exhibited another example of the ruling passion strong in death. The objects of his former care lay nearest his heart; and the fate of Europe seemed to render him insensible to his own. The Earl of Albemarle arriving from Holland, he conferred with him in private on the posture of affairs abroad; and having received the sacrament from Archbishop Tennison, he expired on Sunday the 8th of March, having lived fifty-two years, and reigned thirteen. William was in his person of the middle stature; his body was slender and his constitution delicate. He had an aquiline nose, sparkling eyes, a large forehead, and a grave solemn aspect. He left behind him the character of a great politician, though he had never been popular; and of an able general, though he had seldom been victorious. His deportment was grave, phlegmatic, and sullen; nor did he ever show any fire or animation except in the day of battle. On such occasions he was all life, gaiety, energy, and alacrity. At the last moment, when his mind was otherwise oppressed, he retained a just sense of religion, and seemed impressed with anxiety for the welfare of his subjects. He lay quietly and composed, with his eyes fixed upon heaven; and when his speech failed him, he appeared so resigned that no man could die either better prepared or with greater constancy and piety, than this prince, whose memory will ever be respected by the lovers of rational liberty.

William was succeeded by the Princess Anne, who had married George, Prince of Denmark. She ascended the throne in the thirty-eighth year of her age, to the general satisfaction of all parties. William had died on the eve of a war with France; and the present queen, who was generally guided by the advice of her ministry on every important occasion, was now urged by opposite councils, one part of the ministry being inclined for war and another for peace. At the head of those who opposed a war with France was the Earl of Rochester, lord lieutenant of Ireland, first cousin to the queen, and the chief of the Tory faction; whilst the opposite party was led by the Earl, afterwards Duke, of Marlborough, and subsequently so much and justly renowned for his victories over the French. After both parties had given their opinions, that of Marlborough preponderated. The queen resolved to declare war; and having communicated her intentions to the House of Commons, by whom it was approved, war was proclaimed accordingly. In this declaration Louis was taxed with having taken possession of a great part of the Spanish dominions; with a design to invade the liberties of Europe, and to obstruct the freedom of navigation and commerce; with having offered an unpardonable insult to the queen and her throne, by acknowledging the title of the pretender; and with attempting to unite Spain to his own dominions, by placing his grandson upon the throne of that kingdom, and thus endeavouring to destroy the balance of power that subsisted among the states of Europe. This declaration of war on the part of England was seconded by similar manifestoes by the Dutch and Germans.

Louis XIV., whose power had been greatly circumscribed by William, expected, on the death of the latter, to enter on a field open for new conquests and fame. At the news of the English monarch's death, therefore, he could not suppress his satisfaction; whilst the people of Paris, and indeed throughout the whole kingdom, testified their joy in the most public manner. The French monarch was filled with indignation at seeing such a combination against him; but his resentment fell chiefly on the Dutch, and he declared with great emotion, that as for those gentlemen pedlars, they should one day repent their insolence and presumption in declaring war against him, whose power they had formerly felt and dreaded. By these threats, however, the affairs of the allies were no way influenced. Marlborough was appointed general of the British forces, and by the Dutch he was chosen generalissimo of the allied army; and indeed his subsequent conduct showed that no person could possibly have been chosen with greater propriety. He had learned the rudiments of war under Turenne, having served as a volunteer in his army; and that celebrated commander had prognosticated his future greatness.

The first attempt which Marlborough made to deviate from the general practice of the army was to advance the subaltern officers, whose merits had hitherto been neglected. Regardless of seniority, wherever he found ability

he was sure to promote it; and thus all the upper ranks of command were filled with men rather remarkable for their skill and talents than for their age and experience. In his first campaign, in the beginning of July 1702, he repaired to the camp at Nimeguen, where he found himself at the head of sixty thousand men, well provided with all necessaries, and long disciplined by the best officers of the age. He was opposed on the part of France by the Duke of Burgundy, a youth of very little experience in the art of war; but the real acting general was Marshal Boufflers, the second in command, an officer of courage and activity. But wherever Marlborough advanced, the French were obliged to retire before him, leaving all Spanish Guelderland at his discretion. The Duke of Burgundy, finding himself obliged to retreat before the allied army, rather than expose himself longer to such a mortifying indignity, returned to Versailles, leaving Boufflers to command alone. The latter then retired to Brabant; and Marlborough ended the campaign by taking the city of Liege, in which he found an immense sum of money and a great number of prisoners.

This good fortune seemed to console the nation for some unsuccessful expeditions at sea. Sir John Munden having permitted a French squadron of fourteen ships to escape him by taking shelter in the harbour of Corunna, was dismissed the service. An attempt was made upon Cadiz by sea and land, Sir George Rooke commanding the navy, and the Duke of Ormond the land forces; but this also miscarried. At Vigo, however, the British arms were attended with better success; and the French fleet which had taken refuge there were burned in order to prevent their falling into the hands of the English, whilst ten ships of war were taken, together with eleven galleons, and above a million of money in silver. In the West Indies, Admiral Benbow, who had been stationed with ten ships to distress the enemy's trade, having received information that Du Casse the French admiral was in those seas with a force equal to his own, resolved to attack him; and having discovered the enemy's squadron near St Martha steering along the shore, he quickly gave the necessary orders to his captains, and forming the line of battle, began the action. But the rest of the fleet having taken some causeless disgust at his conduct, permitted the admiral to sustain, almost alone, the whole fire of the enemy. Nevertheless, the engagement continued till night, and he determined to renew it next morning; but he had the mortification to perceive that all the rest of his ships had fallen back except one, who joined him in urging the pursuit of the enemy. During four days this intrepid seaman, assisted by only one ship, pursued and fought the enemy, whilst his dastardly officers remained at a secure distance. In the last day's battle, which was more furious than any of the preceding conflicts, the admiral's leg was shattered by a cannon-ball, and he himself died soon after of his wounds. Two of his associates were shot on their arrival in England; one died on his passage home; and the remainder were justly disgraced.

The next parliament, which was convened by the queen, evinced great satisfaction at the success of the British arms on the Continent. The House of Commons, composed chiefly of Tories, voted forty thousand seamen, and the like number of land forces, to act in conjunction with those of the allies. But soon afterwards the queen informed her parliament that she was pressed by the allies to augment her forces; and upon this it was resolved that ten thousand more men should be added to the continental army; on condition, however, that the Dutch should immediately break off all commerce with France and Spain.

In the beginning of April 1703 the Duke of Marlborough crossed the sea, and assembling the allied army,

Reign of
Queen
Anne.

opened the campaign with the siege of Bonn, the residence of the Elector of Cologne, which held out but a short time. He next retook Huy, the garrison of which, after a vigorous defence, surrendered prisoners of war. Limburg was then besieged, and surrendered in two days; and the campaign concluded by securing the country of Liege, the electorate of Cologne, and the Lower Rhine, against the designs of the enemy.

In the campaign of 1704, the Duke of Marlborough, having informed the Dutch of his intention to march to the relief of the empire, which had been for some time oppressed by the French forces, the states gave him full powers to act as he thought proper, with assurances of assistance in all his efforts. The French king, finding Boufflers no longer capable of opposing Marlborough, appointed the Marshal de Villeroi to command in his room. But Marlborough, having no great fears from Villeroi, immediately marched to the assistance of the emperor. Taking with him about thirteen thousand British troops, he advanced by rapid marches to the banks of the Danube, defeated a body of French and Bavarians stationed at Donawerth to oppose him, and, passing the river, laid under contribution the electorate of Bavaria, which had taken part with the enemy. Villeroi, who at first had attempted to follow his motions, soon lost sight of him; nor was the French commander apprised of his route till informed of his successes. But, in the mean time, Marshal Tallard prepared by another line to obstruct Marlborough's retreat, with an army of thirty thousand men; and being soon after joined by the forces of the Elector of Bavaria, the French army in that part of the Continent amounted to sixty thousand veterans, commanded by two generals then reputed the best in France. To oppose this powerful force the Duke of Marlborough formed a junction with a body of thirty thousand men under the celebrated Prince Eugene; so that, with this reinforcement, the allied army amounted to about fifty-two thousand combatants. After various marches and countermarches, the two armies met at Blenheim. The French, under Tallard, were posted upon a hill near the town of Hochstet, having their right covered by the Danube and the village of Blenheim, their left by the village of Lutzingen, and their front by a rivulet, the sides of which were steep and the bottom marshy; and in this strong position they seemed to bid defiance to their adversaries. But Marlborough and Eugene, having carefully examined the ground, resolved to attack them, and accordingly advanced upon the plain in front of their position. The battle began by a cannonade on both sides, which lasted from nine in the morning until half an hour after mid-day. At this moment Marlborough, who had completed all his dispositions, crossed the rivulet at the head of the English, and attacked the cavalry of Tallard on the right, while that officer was engaged in reviewing his troops on the left. An hour elapsed, however, before Prince Eugene could bring up his forces to attack the other wing of the enemy commanded by the Elector of Bavaria; but, during this time, Marlborough's attack had been completely successful; and when Tallard repaired to the scene of action he found that the French cavalry had been thrice repulsed. He then attempted to lead to the charge a large body of troops which he had posted in the village; but these being furiously assailed by a strong detachment of English troops, were scarcely able to maintain their ground, while the French, taken in flank and in reverse, were totally defeated. This success led to a movement which proved completely decisive. Penetrating between the two wings of the French army, through the space left open by the defeat of the cavalry, the English troops effected a total separation between them, whilst the large force imprudently posted in the village of Blenheim had its commu-

nications intercepted by another strong detachment. In this situation Tallard flew to rally some of his squadrons; but, being short-sighted, he mistook a Hessian for a French corps, and was made prisoner. On the left Prince Eugene had encountered a vigorous resistance and been thrice repulsed; but, having received some reinforcements from Marlborough, he at last succeeded in dislodging the enemy opposed to him. The battle was now won. The French fled in the utmost confusion, whilst the corps of thirteen thousand men which occupied Blenheim were surrounded and made prisoners. About twelve thousand French and Bavarians were killed on the field or drowned in the Danube; whilst one hundred colours, two hundred standards, three thousand tents, all the baggage, and the military chest of the French army, formed the trophies of this glorious day. Of the allies not less than thirteen thousand were killed, wounded, or missing; but the conquerors by the victory gained a territory of a hundred leagues in extent, and inflicted a blow on the power of France from which it did not soon recover. Having finished the campaign, the duke repaired to Berlin, where he procured a reinforcement of eight thousand Prussians to serve under Prince Eugene in Italy, and then proceeded to negotiate for succours at the court of Hanover; after which he returned to England, and was received with every possible demonstration of joy. The manor of Woodstock was conferred upon him; and the lord-keeper, in the name of the Peers, honoured him with the praises which his talents and conduct had so well merited.

Nor were the arms of Britain less fortunate by sea than by land. The town of Gibraltar was taken by the Prince of Hesse and Sir George Rooke; but so little was the value of the conquest at that time understood, that it was for some time debated whether the admiral should be thanked for making it, and at last it was considered as unworthy of public gratitude. Soon after, the British fleet, to the number of fifty-three ships of the line, came up with that of France, consisting of fifty-two men of war, commanded by the Count de Toulouse, off the coast of Malaga. The battle began at ten in the forenoon, and continued with great fury for six hours, when the van of the French began to give way. The British admiral for two days attempted to renew the engagement; but this was cautiously declined by the French, who at last disappeared totally. Both sides claimed the victory, although the result showed that it was in favour of the British. Meanwhile the Spaniards, alarmed at the capture of Gibraltar, sent the Marquis of Villadurias with a large army to retake it. France also dispatched a fleet of thirteen ships of the line; but some of them parted company in a gale, and others were taken by the British. Nor was the land force more successful. The siege continued for four months, during which time the Spaniards repeatedly attempted in vain to scale the rock; and at last, losing all hopes of taking the place, they were contented to draw off their men and abandon the enterprise.

Whilst the British were thus victorious by land and sea, a new scene of contention was opened on the side of Spain. Philip V. grandson of Louis XIV. had been raised to the throne of that kingdom, having been nominated as successor to the crown by the late king of Spain's will. But in a former treaty among the powers of Europe, Charles, son of the emperor of Germany, was appointed heir to that crown; and this treaty had been guaranteed by France herself, although she now resolved to recal that consent in favour of a descendant of the house of Bourbon. Charles was still further led to urge his pretensions to the crown of Spain by the invitation of the Catalonians, who declared in his favour, and promised, with the assistance of the British and Portuguese, to arm in his cause.

Anne.

On his way to his new dominions, he landed in England, where, on his arrival, he was received by the Dukes of Somerset and Marlborough; kindly greeted by the queen; and furnished with two hundred transports, thirty ships of war, and nine thousand men, under the command of the Earl of Peterborough, a man of romantic bravery and high military genius. The first attempt of this general was on the city of Barcelona, at that time defended by a garrison of five thousand men. The fort of Monjuic, situated on a hill which commanded the city, was attacked; and the outworks being taken by storm, as well as the powder-magazine blown up, the fort surrendered, and in a short time afterwards the city capitulated. The conquest of all Valencia succeeded the capture of Barcelona; Charles became master of Aragon, Carthagen, Grenada, and Madrid; and the British general having entered the capital in triumph, there proclaimed Charles king of Spain, without opposition.

These successes, however, were soon eclipsed by the victories of the Duke of Marlborough, which alone engrossed public attention. In 1706 he opened the campaign with an army of eighty thousand men. The army of Villeroi, in the vicinity of Tirlémont, was of nearly equal strength, and he had orders to attack the allies before the Danish and Prussian contingents could join. But, whilst it was his intention to become the assailant, Villeroi was himself attacked, in a position which prevented his developing the whole of his force. He had the river Mehaigne on his flank, and his centre occupied the village of Ramillies, while a marsh covered his left. Marlborough skilfully availed himself of the disposition made by his antagonist; and knowing that Villeroi's left was paralysed by reason of the marsh in front, which effectually prevented its acting on the offensive, he directed his principal attack upon the centre, which formed the key of the position. The issue of the conflict was never for a moment doubtful; the village was carried in the most gallant style, and both wings being at once separated and turned, a complete rout ensued. About six thousand French were made prisoners, and upwards of eight thousand killed or wounded. The whole of Brabant became the reward of the victors. The French troops were now dispirited; the city of Paris was in confusion; and Louis, who had long been flattered with conquest, was humbled to such a degree as almost to excite the compassion even of his enemies. He sued for peace, but in vain; the allies carried all before them; and his capital began to dread the approach of the conquerors. But what neither his armies nor his politics could effect, was brought about by the intrigues of a party in England. The dissensions between the Whigs and Tories saved France, which now seemed tottering on the very brink of ruin.

The councils of the queen had hitherto been governed by a Whig ministry; for though the Duke of Marlborough began his career in the interest of the opposite party, he soon joined the Whigs, whom he found most sincere in the design of humbling France. The people, however, were now in fact beginning to change their sentiments, and to imbibe the slavish spirit of Toryism. The queen's personal virtues, her successes, her deference for the clergy, and their great veneration for her, all contributed to give her great influence with the nation. Persons of every rank were not ashamed to defend the most servile tenets, when these tended to flatter or increase the power of the sovereign, and to argue in favour of strict hereditary succession, divine right, and non-resistance to the regal power. The Tories, though joining in vigorous measures against France, were never very ardent enemies of that country; but they secretly hated the Dutch, and longed for an opportunity of breaking with that people. With this view

they began to meditate schemes of opposition to the Duke of Marlborough, whom they represented as an interested man, who sacrificed the real interests of the nation, in protracting a ruinous war, for his own private emolument and glory; and as the country was oppressed with a load of taxes, which a continuance of the war would inevitably increase, discontent began to spread, and the Tories wanted only a few determined leaders to assist them in removing the present ministry.

In the meanwhile, a succession of losses began to dissipate the conquering mania which had seized the nation, and to incline them to wish for peace. The Earl of Galway, who commanded the English army in Spain, was completely defeated at Almanza by the Duke of Berwick; and in consequence of this victory all Spain, except the province of Catalonia, returned to their duty to Philip as their lawful sovereign. An attempt was made upon Toulon by the Duke of Savoy and Prince Eugene by land, and an English fleet by sea; but to no purpose. The fleet under Sir Cloudesley Shovel, having set sail for England, was driven by a violent storm on the rocks of Scilly, where his own ship was lost, and every person on board perished; while three more ships met with the same fate, and four others were saved with the utmost difficulty. In Germany, Marshal Villars carried all before him, and was upon the point of restoring the Elector of Bavaria. The only hopes of the people lay in the activity and conduct of the Duke of Marlborough, who opened the campaign of 1707, about the middle of May; but even here they were disappointed. The duke declined an engagement; and, after a variety of marches and countermarches, both armies retired into winter quarters about the end of October. The French made vigorous preparations for the next campaign; and the duke returned to England to meet with a reception which he did not at all expect, and which he certainly did not deserve.

The most remarkable transaction of this year, and indeed of this whole reign, was the union between the two kingdoms of Scotland and England. Though governed by one sovereign since the time of James I. of England, yet each nation had continued to be ruled by its respective parliament, and often professed to pursue interests opposite to those of its neighbour. The union had often been unsuccessfully attempted before, and had indeed been the cause of the bloody wars in the times of Edward I. and Edward III. of England. In all the former proposals on that head, both nations were supposed to remain free and independent; each kingdom having its own parliament, and being subject only to such taxes and other commercial regulations as those parliaments judged expedient for the benefit of their respective states. But after the destruction of the Darien colony in the manner already related, King William had endeavoured to allay the national ferment by resuming the affair of a union with as much assiduity as his warlike occupations would allow. The terms proposed were the same with those formerly tendered; namely, a federal union, somewhat like that of the states of Holland. With this view the Scots were prevailed on to send twenty commissioners to London, who, with twenty-three on the part of England, assembled at Whitehall in the month of October 1702. Here they were honoured with a visit from the queen, in order to enliven their proceedings and stimulate them to the more speedy dispatch of business; but the treaty was entirely broken off at this time by the Scottish commissioners insisting that the rights and privileges of their countrymen trading to Africa and the Indies should be preserved and maintained. It was, however, resumed in the year 1706, when the commissioners again assembled on the 16th of April, in the council chamber of Whitehall. The Scottish commissioners

Reign of
Queen
Anne.

Reign of
Queen
Anne.

still proposed a federal union; but the English were determined on an incorporation, which should not afterwards be dissolved by a Scottish parliament. Nothing but this, they said, could settle a perfect and lasting friendship betwixt the two nations. The commissioners from Scotland, however, continued to resist the article which subjected their country to the same customs, excises, and regulations of trade as England; but the queen being persuaded to pay two visits in person to the commissioners, exerted herself so vigorously, that a majority was at last gained over; and all the rest yielded, though with reluctance, excepting Lockhart of Carnwath, who could not by any means be persuaded either to sign or seal the treaty.

The articles being fully prepared on the 22d of July, were presented next day to her majesty by the lord-keeper in the name of the English commissioners; and at the same time a sealed copy of the instrument was delivered by the lord chancellor of Scotland. The articles were most graciously received; and the same day the queen dictated an order of council, threatening with prosecution such as should be concerned in any discourse or libel, or in laying wagers, with regard to the union. But notwithstanding all this harmony the treaty was received with the utmost disapprobation in Scotland. The terms had been carefully concealed, so that nothing transpired till the whole was at once laid before parliament. The ferment then became general; and all ranks of people, however divided in other respects, united against this detested treaty. The nobility and gentry were exasperated at the annihilation of parliament, and the consequent loss of their influence and credit. The body of the people cried out, that the independence of the nation was sacrificed to treachery and corruption; and insisted, that the obligations laid on their members to stay so long at London, in their attendance on the British parliament, would drain the country of its money, impoverish the members themselves, and subject them to the temptation of being corrupted. Nor was the commercial part of the people better satisfied. The dissolution of the India Company; the taxes laid on the necessaries of life; and the vast number of duties, customs, and restrictions, laid upon trade, were all of them matter of complaint. Before this time Scotland had traded freely to the Levant, the Baltic, France, Spain, Portugal, Holland, and the Dutch plantations; and it seemed difficult to conceive how the commerce of the country could be advanced by laying restrictions upon it in regard to these places, especially as the compensation allowed, namely, the privilege of trading to the English plantations in America, formed a very trifling advantage, seeing that the amount of the whole exports to these places did not by any means equal the expense of defending them. The most violent disputes took place in the parliament. Lord Belhaven delivered a most pathetic speech, in which, enumerating the miseries that would attend this treaty, he drew tears from the audience, and uttered many prognostications, which to this day are reckoned prophetic by many of the Scottish nation. Almost every article of the treaty was the subject of a protest; and addresses against it were presented to parliament by the convention of royal burghs, the commissioners of the general assembly, and the company trading to Africa and the Indies, as well as from shires, stewartries, burghs, towns, and parishes, without distinction of Whig, Tory, Presbyterian, or Episcopalian. Nor was the resentment of the common people without doors less violent than that of the members within. A coalition was formed between the Presbyterians and Cavaliers; and to such a height did the resentment of the people rise, that they actually chose officers, formed themselves into regiments, provided horses and ammunition, burnt the articles of union, justified their

conduct by a public declaration, and resolved to take the route to Edinburgh and dissolve the parliament.

In the mean time the privy council issued a proclamation against riots, commanding all persons to retire from the streets whenever the drum was beat; ordering the guards to fire on those who disobeyed this command; and indemnifying them from all prosecution for maiming or slaying the lieges. But even these precautions were insufficient. The Duke of Queensberry, the chief promoter of the union, though guarded by double lines of horse and foot, was obliged to pass through the streets at full gallop, amidst the curses and imprecations of the populace, who pelted his guards, and even wounded some of the persons who attended him in the coach. In opposition to all this fury, the friends of the measure magnified the advantages that would accrue to the kingdom from the union; they abated the resentment of the clergy, by promoting the insertion in the treaty of an act by which the Presbyterian discipline was declared to be the only government of the church of Scotland, unalterable in all succeeding times, and a fundamental article of the union. Emissaries were also employed to disunite the Camerons and the Cavaliers, by demonstrating the absurdity, sinfulness, and danger, of such a proceeding. The India Company was flattered with the prospect of an indemnification for the losses they had sustained, and individuals by sharing an equivalent. And the last manœuvre consisted in bringing over a party in the Scottish parliament, nicknamed the *Squadron Volante*, from their fluctuating between the ministry and the opposition, without attaching themselves to any party till the critical moment, which was either to cement both kingdoms by a firm union, or involve them in the calamities of war. By this unexpected stroke, the ministry obtained a decisive victory, and all opposition was henceforth vain. The articles of treaty were ratified by parliament, with some trifling variations, on the 25th of March 1707; when the Duke of Queensberry finally dissolved that ancient assembly, and Scotland ceased to be a separate independent kingdom.

On the conclusion of the treaty, the queen informed both houses of parliament that the treaty of union, with some additions and alterations, was ratified by an act of the parliament of Scotland; that she had ordered it to be laid before them, hoping it would meet their approbation; that they had now an opportunity of putting the last hand to a happy union of the two kingdoms; and that she would look upon it as a particular happiness if this great work, so often attempted before without success, could be brought to perfection in her reign. Objections, however, were started by the Tory party; but they were at that time too weak to be heard with any attention; and all their arguments were answered with such success by the opposite party, that the union was unalterably completed on the first of May 1707, and the island took the name of *The United Kingdom of Great Britain*.

In this treaty it must be observed, that the commissioners on the part of England were not only able statesmen, but, for the most part, well skilled in trade; which gave them an evident advantage over those of Scotland, who consisted of lords and gentlemen who had no commercial knowledge. Hence they were overmatched by the former in the great objects which are more immediately connected with national prosperity; though they were very careful to preserve all their heritable offices, superiorities, jurisdictions, and other privileges and trappings of the feudal aristocracy. Had the English commissioners made a liberal use of the advantages afforded them at this time, it would have been in their power to have greatly enriched themselves as well as the inhabitants of Scotland; but instead of this they were influenced by the narrow and

Reign of
Queen
Anne.

Reign of
Queen
Anne.

short-sighted principle of commercial monopoly; and the consequences were such as might, with a small degree of reflection, have been foreseen.

In 1708 there was a warm debate in a grand committee of the House of Lords, occasioned by a bill passed by the Commons for rendering the union of the two kingdoms more entire and complete, by which it was enacted, that, from the first of May 1708, there should be but one privy council in the kingdom of Britain. The arguments for the dissolution of the privy council of Scotland were, its enormous stretches of power and acts of cruelty, and the circumstance that it could now be of no other use in Scotland except to enable the court to govern every thing at pleasure, and procure such members of parliament as it thought proper. The dissolution, however, was carried by fifty against forty, after which the nation, deprived of this last fragment of its ancient government, was thrown into a ferment by the opponents of the union; but after an ineffectual attempt in favour of the pretender, animosities began to subside.

We must now return to the Duke of Marlborough, who had gone over to Flanders to open the campaign. Peace had been more than once offered, and treaties entered upon, but as often frustrated. After the battle of Ramillies, the king of France had employed the Elector of Bavaria to write letters in his name to the Duke of Marlborough, containing proposals for opening a congress, and offering to renounce either Spain and its dominions, or the kingdoms of Naples and Sicily, to Charles of Austria, and to concede a barrier to the Dutch in the Netherlands. But these terms were rejected; and the two armies once more met in nearly equal numbers at Oudenarde, on the Scheldt, where an engagement ensued, in which the French were defeated with immense loss; and Lisle, the strongest town in Flanders, with Ghent, Bruges, and all the other towns in that country, soon after fell into the hands of the victors. In this battle the electoral prince of Hanover, afterwards George II. of Britain, greatly distinguished himself, and had the merit of conducting the first attack. His horse was killed under him, and Colonel Luschki was slain close by his side. The campaign ended with fixing a barrier to the Dutch provinces, and it now only remained to force a way into the provinces of the enemy.

The French king, being now in a manner reduced to despair, again sued for peace; but the demands of the allies were so high, that he was obliged to reject them, and prepare for another campaign, in the year 1709. The first attempt of the allies was against the city of Tournay, garrisoned by twelve thousand men, and exceedingly strong both by nature and art. After a terrible siege of twenty-one days, the town capitulated; and a month afterwards the citadel, which was still stronger than the town, surrendered. Next followed the bloody battle of Malplaquet, where the allied army, consisting of a hundred and ten thousand men, attacked the French, consisting of a hundred and twenty thousand, strongly posted, and fortified in such a manner behind the woods of La Merte and Tannières, with triple entrenchments, that their position seemed quite impregnable. Nothing, however, could resist the energy of Marlborough and the bravery of his troops. The French were driven from all their positions, and totally defeated. But the victory cost the allies very dear; for twenty thousand of their best troops lay dead or wounded on the field of battle. The consequence of this victory was the surrender of the city of Mons, which ended the campaign.

The last campaign of the Duke of Marlborough, which happened in the year 1711, probably excelled all his former exploits. He was opposed by Marshal Villars, who

had commanded the French in the battle of Malplaquet; but he contrived his measures so, that, by marching and countermarching, he, without striking a blow, forced the enemy to quit a strong line of entrenchments, which he afterwards took possession of. This enterprise was followed by the taking of Bouchain, which was the last military achievement of this great general. By a continuation of conduct and success almost unparalleled, he had gained to the allies a prodigious tract of country. From the beginning of the war, which had now continued nine years, he had perpetually advanced, and never retreated before his enemies, nor lost an advantage he had obtained over them. He frequently gained possession of the enemy's posts without fighting; and where he was obliged to attack, no fortifications were able to resist him. He had never besieged a city which he did not take, nor fought a battle which he did not win. Thus the allies had reduced under their command Spanish Guelderland, Limburg, Brabant, Flanders, and Hainault; they were masters of the Scarpe; the capture of Bouchain had opened for them a way into the very heart of France; and another campaign might have made them masters of Paris. But on the duke's return from this campaign, he was accused of having taken a bribe of six thousand pounds a year from a Jew who had contracted to supply the army with bread; and the queen thought proper to dismiss him from all his employments.

On the removal of this great general, the command of the British forces was conferred on the Duke of Ormond. The transactions which followed are by no means creditable to the character of the British nation. The people at large, blinded by a headstrong and furious clergy, wished to revive the ceremonies of the Romish religion, and to unite the English and Gallican churches; the general of the army acted a most insidious part, by giving the enemy intelligence of the designs of the allies before he had declared that he was not to act in concert with them; and the queen herself commanded him to pursue this shameful course, nay even acted in a similar manner herself. Prince Eugene complained much of the inactivity of the English general, though apparently unacquainted with his treachery; whilst the whole army loaded him with execrations, calling him a stupid tool, and a general of straw. All this, however, was in vain; the duke continued to prefer the commands of his sovereign to every other consideration, and Ormond lost what Marlborough had gained.

The disgrace of the Duke of Marlborough had been owing to the prevalence of the Tory party, who had now got the Whig ministry turned out; and the consequence was, that notwithstanding all the remonstrances and entreaties of the allies, the British army in Flanders was ordered not to act offensively. Hence the operations languished; a considerable body of the allies was cut off at Denain, and the French retook several towns. A peace, however, was at last concluded in 1713 between France and Britain. In this treaty it was stipulated that Philip, now acknowledged as king of Spain, should renounce all right to the crown of France, the union of two such powerful kingdoms being thought dangerous to the liberties of Europe. It was agreed that the Duke de Berri, Philip's brother, and next after him in succession, should also renounce his right to the crown of Spain in case he became king of France. And it was stipulated that the Duke of Savoy should possess the island of Sicily with the title of king, together with Fenestrelles, and other places on the Continent; and this increase of dominion was in some measure provided out of the spoils of the French monarchy. The Dutch had the barrier granted them which they so much desired; and if the crown of France was deprived of some dominions to enrich the Duke of Savoy, the house of Austria was also taxed to supply the wants of the Hollanders,

Reign
Queen
Anne.

who were put in possession of the strongest towns in Flanders. The fortifications of Dunkirk were demolished. Spain gave up Gibraltar and the island of Minorca. France resigned her pretensions to Hudson's Bay, Nova Scotia, and Newfoundland, but was left in possession of Cape Breton, with the liberty of drying fish upon the shore. Among the articles creditable to the British nation, their setting free the French Protestants confined in the prisons and galleys for their religion was not the least meritorious. In behalf of the emperor, it was stipulated that he should possess the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands; and the king of Prussia was to have Upper Guelderland. A period was fixed for the emperor's acceding to these articles, as he had for some time obstinately refused to assist at the negociation. This famous treaty was signed at Utrecht on the last day of March 1713.

The same year was also remarkable for an attempt of the Scottish Peers and Commons to dissolve the union, which, as already stated, had proved exceedingly disagreeable and distressful to the nation. During the debates on this subject the Earl of Peterborough endeavoured to prove the impossibility of dissolving the treaty; but the Duke of Argyll, who had originally promoted the union, now declared against it, and said, that unless it were dissolved he did not long expect to have either property in Scotland or liberty in England. By some other Peers it was alleged, that the union had not produced its intended effect; that it had been designed to promote friendship between the two nations; that, so far from answering this purpose, the animosities between them were never so great as then; and that if separated again they would be better friends than in a state of nominal union and real dissension. This motion was however overruled; but the discontent of the people still continued; addresses were prepared throughout the kingdom; and matters were in danger of coming to the worst extremities, when the attempt of the pretender in 1715 so divided the minds of the people that no unanimous effort could ever afterwards be made for the repeal of the union.

The history of the latter portion of this reign consists entirely of the intrigues of the Whigs and Tories against each other, which, as they are now of no importance whatever, it is needless to take up time in relating, further than that the Tory influence continued to prevail. Whether the ministry at this time wished to alter the succession from the Hanoverian line, cannot now be clearly ascertained; but it is certain that the Whigs firmly believed it, and the Tories but faintly denied the charge. The suspicions of the former became every day stronger, particularly when they saw a total removal of the Whigs from all places of trust and confidence throughout the kingdom, and their employments bestowed on professed Tories, supposed to be devoted to the cause of unbroken hereditary succession.

The violent dissensions between these parties, with their cabals and tumults, made the queen's situation very disagreeable; her health visibly declined. On the 28th of July 1714 she fell into a lethargic insensibility; and, notwithstanding all the medicines prescribed by the physicians, the distemper gained ground so fast, that next day her life was despaired of. The members of the privy council were now summoned from the different parts of the kingdom, and began to provide for the security of the constitution. A letter was sent to the Elector of Hanover, informing him of the queen's desperate condition, and desiring him to repair to Holland, where a British squadron would attend to convey him to England; and instructions were at the same time dispatched to the Earl of Strafford at the Hague, to require the states-general to be prepared to guarantee the Protestant succession. Precautions were

also taken to secure all the sea-ports; and the command of the fleet was bestowed upon the Earl of Berkeley, a professed Whig. These measures answered a double purpose, as they argued the alacrity of the Whigs in the cause of their new sovereign, and seemed to imply that the state was in danger from the disaffection of the opposite party. On the 30th of July the queen seemed somewhat relieved by the medicines which had been administered; and having risen from her bed about eight in the morning, she walked a little; but she was soon afterwards seized with an apoplectic fit; and although she recovered somewhat by the assistance of Dr Mead, she continued all night in a state of stupefaction, and expired the following morning, at seven, having lived forty-nine years, and reigned upwards of twelve. This princess was remarkable neither for learning nor capacity. Like all the rest of her family, she seemed rather fitted for the duties of private life than those of a public station, being a pattern of conjugal fidelity, a good mother, a warm friend, and an indulgent mistress; and to her honour it should be recorded, that during her reign none suffered for treason on the scaffold. In her ended the line of the Stuarts, a family who neither rewarded their friends nor punished their enemies, and whose misconduct and misfortunes are scarcely to be paralleled in history.

CHAP. X.

REIGN OF GEORGE I.

Accession of George I.—His arrival in England.—Favour shown by him to the Whigs.—National Discontents.—Dissolution of Parliament.—New one assembled.—Its violent proceedings.—Rebellion in Scotland.—Battle of Sheriffmuir.—Proceedings of the Jacobites in England.—Expedition of the Earl of Derwentwater.—Jacobites forced to surrender at Preston.—Ridiculous schemes of the Pretender.—He lands in Scotland without means, and quits it without necessity.—Cruel treatment of the rebels.—Execution of Derwentwater and Kenmuir.—Escape of others by various means.—Duration of Parliaments extended.—Britain threatened with invasion by Charles XII. of Sweden.—Quadruple Alliance.—War with Spain.—Intended invasion by the Spaniards defeated.—Irish Parliament made dependent on that of Britain.—South Sea Scheme.—Origin and nature of this delusion.—The Directors punished.—Expedition of Admiral Hosiér.—Death of George I.

The queen had no sooner resigned her breath than the privy council met, and three instruments were produced, by which the Elector of Hanover appointed several of his adherents to be added as lords justices to the great officers of the kingdom. Orders were also issued out for proclaiming George, son of Ernest Augustus, Elector of Brunswick, and of Sophia, grand-daughter of James I., king of England, Scotland, and Ireland; and the regency appointed the Earl of Dorset to carry to him the intimation of his accession to the crown, and to attend him in his journey to England.

The king landed at Greenwich, and walked to his house in the park, accompanied by a great number of the nobility and other persons of distinction. George I. was fifty-four years of age when he ascended the British throne; and his mature age, his experience and sagacity, his numerous alliances, and the general tranquillity of Europe, all contributed to establish his interests, and promise him a peaceable and happy reign. His virtues, though not shining, were solid; and he was of a very different disposition from the Stuart family whom he succeeded; for, soon after his arrival in England, he was heard to say, "My maxim is, never to abandon my friends, to do justice to all the world, and to fear no man." To these qualities of resolution and perseverance he joined great application

Reign of George I. to business; but, unfortunately for England, he studied the interests of the territory he had left more than those of the kingdom he came to govern.

The new king early discovered a natural enough inclination to support those who had raised him to the throne, or, in other words, the Whig party. Immediately after his landing, he sent for such of the nobility as had distinguished themselves by their zeal for his succession. He expressed the greatest regard for the Duke of Marlborough, who had just then arrived from the Continent, whither he had been driven by the violence of the Tories; and he professed the same friendship for the other leaders of the Whigs, while the Tories found themselves excluded from the royal favour. The king did not seem sensible that the monarch of a faction rules but one half of his subjects; and it was his misfortune to be surrounded by men who, whilst they pretended to secure the crown for the king, used all their arts to confirm their own interests, extend their connections, and give laws to their sovereign. In consequence of these partialities, the greatest discontent was excited throughout the whole kingdom. The Tories or Jacobites raised terrible outcries; and had the pretender been a man of judgment or ability, a fair opportunity now offered him of striking a decisive blow. Instead of this, he remained a calm spectator on the Continent, and only sent over his emissaries to disperse ineffectual manifestoes and delude the unwary. At this time the Catholic religion was much hated in England; but the principles of the Dissenters were little, if at all, more agreeable to the generality. The Tories affirmed that, under a Whig administration, heresy and impiety were daily gaining ground; whilst the lower orders of the clergy joined in these complaints, and pointed out several tracts published in favour of Arianism and Socinianism. The ministry, however, not only refused to punish the delinquents, but silenced the clergy themselves, and forbade their future disputations on these topics.

The parliament having been dissolved, another was now called by a very extraordinary proclamation, in which the king complained of the evil designs of men disaffected to his succession, and of their misrepresentations of his conduct and principles; expressed his hopes that his subjects would send up to parliament the fittest persons to redress the present disorders; and entreated that they would elect such in particular as had expressed a firm attachment to the Protestant succession. In the election of this important parliament, uncommon vigour was exerted on both sides; but by dint of the monied interest which prevailed in corporations, and the activity of the ministry, a great majority of Whigs was returned both in England and Scotland. Upon the assembling of the new parliament the most violent measures were resolved on against the late ministry. A committee was appointed to inspect all the papers relative to the recent treaty, and to select such of them as might furnish grounds of accusation against the former ministry; and the Earl of Oxford was impeached of high treason, and sent to the Tower. Nor was the violence of the Commons answered with less vehemence without doors. Tumults became every day more frequent, and each new ebullition served only to increase the severity of the legislature, which at length passed an act, declaring, that if any persons to the number of twelve, unlawfully assembled, should continue together one hour after being required to disperse by a justice of peace or other officer, and after hearing the act against riots read in public, they should be deemed guilty of felony without benefit of clergy. These proceedings excited the indignation of the people, who perceived that the avenues of royal favour were closed against all but a faction; and a rebellion commenced in the sister kingdom,

where to other grievances was added that of the union, which all considered as an oppression. The malcontents of that country had all along maintained a correspondence with their friends in England, and some of the Tory party who were attached to the Protestant religion, and of moderate principles in government, began to associate with the Jacobites, and to wish in earnest for a revolution.

Scotland first showed them the example. The Earl of Mar, assembling three hundred of his vassals in the Highlands, proclaimed the pretender at Castleton, and setting up his standard at Braemar, assumed the title of Lieutenant-general of his Majesty's Forces. To second these attempts, two vessels arrived from France with arms, ammunition, and a number of officers, together with assurances, that the pretender himself would shortly come over to head his own forces. In consequence of this promise, the earl soon found himself at the head of ten thousand men well armed and provided; and having secured the pass of Tay at Perth, where his head-quarters were established, he made himself master of the province of Fife, and the whole sea-coast on that side of the Frith of Forth. He then marched to Dumblane, as if with the intention of crossing the Forth at Stirling Bridge; but there he was informed that the Duke of Argyll, who had been appointed commander-in-chief of all the forces in North Britain, was advancing against him from Stirling with his own clan, assisted by some troops from Ireland. Upon this he at first judged it proper to retreat; but being soon afterwards joined by reinforcements under the Earl of Seaforth, and General Gordon, an experienced officer, who had signalled himself in the Russian service, he resolved to face the enemy, and directed his march towards the south. The Duke of Argyll, apprised of his intentions, and anxious to prove his attachment to the present government, resolved to give him battle in the neighbourhood of Dumblane, though his forces did not amount to half the number of the enemy. Accordingly, in the morning he drew up his army, which did not exceed four thousand men, in order of battle; but he soon found himself greatly outflanked by the insurgents. The duke, therefore, perceiving the earl making attempts to surround him, was forced to alter his dispositions; but, from the scarcity of general officers, this was not done so expeditiously as to be completed before the insurgents began the attack. The left wing of the duke's army received the centre of the enemy, and supporting the first charge without shrinking, seemed for a time victorious. The chief of Clanronald was killed; but Glengarry, who was second in command, waving his bonnet and crying out "Revenge!" animated the rebel troops to such a degree, that they followed him close to the points of the enemy's bayonets, and got within their guard, when a total rout ensued of that wing of the royal army. General Witham, their commander, fled full speed to Stirling, and gave out that the rebels were completely victorious. But Argyll, who commanded in person on the right, having in the meanwhile attacked the left of the enemy, drove them before him for two miles, notwithstanding they often faced about and attempted to rally; and having entirely broken and driven them over the river Allan, he returned to the field of battle. Here, however, to his great mortification, he found the enemy victorious, and patiently waiting the attack. But instead of renewing the engagement, both armies continued to observe each other, neither caring to recommence the contest; and towards evening each drew off. Both sides of course claimed the victory; but all the advantages of success belonged to Argyll. He had arrested the progress of the enemy; and, in their circumstances, delay was defeat. In fact, the Earl of Mar soon found his losses and disappointments increase. The Castle of Inverness, of which he had obtain-

Reign of George I. ed possession, was delivered up by Lord Lovat, who had hitherto professed to act in the interest of the pretender; the Marquis of Tullibardine also forsook the earl, in order to defend his own part of the country; and many of the clans, seeing no likelihood of coming to a second engagement, returned quietly home.

Nor was the rebellion more successfully prosecuted in England. From the time the pretender had undertaken this wild project at Paris, in which the Duke of Ormond and Lord Bolingbroke were engaged, Lord Stair, the English ambassador there, had penetrated all his designs, and sent faithful accounts of all his measures and of all his adherents to the ministry at home. Upon the first rumour of an insurrection, therefore, several lords and gentlemen of whom they had suspicions were imprisoned; and although these precautions were insufficient to stop the insurrection in the western counties, where it had already begun, all the preparations of the insurgents were weak and ill conducted, while every measure was betrayed to government as soon as projected, and many revolts were repressed in the very outset.

But the insurrection in the northern counties attained to greater maturity. In the month of October 1715, the Earl of Derwentwater and Mr Forster took the field with a body of horse, and, being joined by some gentlemen from the borders of Scotland, proclaimed the pretender. Their first attempt was to seize upon Newcastle, in which they had many friends; but finding the gates shut against them, they retired to Hexham. To oppose them General Carpenter was detached by government with a body of nine hundred men; and an engagement was hourly expected. The rebels had two courses, by pursuing which they might have conducted themselves with prudence and safety. The one was, to march directly into the western parts of Scotland, and there join General Gordon, who commanded a strong body of Highlanders; and the other was, to cross the Tweed and boldly attack General Carpenter, whose forces did not exceed their own. But, from the infatuation attendant on the measures of the Jacobite party, neither of these courses was pursued. They took the route to Jedburgh, by which they hoped to elude Carpenter, and penetrate into England by the western border. But this was the most effectual means of cutting themselves off from either assistance or retreat. A party of Highlanders, who had by this time joined, at first refused to accompany them in so desperate an incursion, and one half of their number in consequence returned to their own country. At Brampton Mr Forster opened his commission of general, which had been sent him by the Earl of Mar, and there proclaimed the pretender. The insurgents then continued their march to Penrith, where a body of the militia, assembled to oppose them, fled at their approach. From Penrith they proceeded by the way of Kendal and Lancaster to Preston, of which they took possession without any kind of resistance. But this was the last stage of their ill-fated advance; for General Wills, at the head of seven thousand men, came up to attack them, and from his activity there was no escaping. They now, therefore, raised barricades about the town, put the place in a posture of defence, and repulsed with success the first attacks of the enemy's force. But next day Wills, reinforced by Carpenter, invested the town on all sides. In this deplorable situation Forster proposed to capitulate with the general; and accordingly sent Colonel Oxburgh, who had been taken prisoner, with a trumpet, to propose terms. Wills, however, refused to listen to such a proposition, alleging that he could not treat with rebels, and that the only favour they had to expect was to be spared from immediate slaughter. This was a hard condition; but as no better could be obtained, they laid down their

arms, and were put under a strong guard. All the noble-men and leaders were secured, and a few of their officers were tried for deserting from the king's army, and shot by order of a court-martial. The common men were imprisoned at Chester and Liverpool; whilst the noblemen and considerable officers were sent to London, and led through the streets pinioned and bound together, in order to intimidate their party in the metropolis.

But, however ill the schemes of the pretender may appear to have been conducted in Britain, they were still more so in France. Bolingbroke had been appointed his secretary at Paris, and Ormond his prime minister. But these statesmen quickly found that nothing could be done in favour of his cause. The king of France, who had ever warmly espoused the interest of the exiled family, was just dead; and the Duke of Orleans, who succeeded to the government of the kingdom, was averse to lend the pretender any assistance. His party, however, which was composed of the lowest and the most ignorant exiles from the British dominions, affected the utmost confidence, and boasted of a certainty of success. The deepest secrets of his cabinet, and all his intended measures, were bandied about in coffee-houses by persons of the lowest rank both in fortune and abilities; whilst subaltern officers aspired to be generals, and even prostitutes were intrusted with the management of his negotiations. From such instruments and such councils nothing could be augured but folly and disaster.

The pretender, in fact, might easily have seen that his affairs were desperate; yet, with his usual infatuation, he resolved to hazard his person among his friends in Scotland, at a time when such a measure was too late to serve any rational purpose. Accordingly, travelling through France in disguise, and embarking in a small vessel at Dunkirk, he arrived, after a short voyage, on the coast of Scotland, with only six gentlemen in his train. He passed unknown through Aberdeen to Fetteresso, where he was met by the Earl of Mar, with about thirty noblemen and gentlemen of the first quality, and solemnly proclaimed; and his declaration, dated at Comerey, was printed and dispersed. He then proceeded to Dundee, where he made a public entry; and in two days more he arrived at Seone, where he intended to have the ceremony of his coronation performed. He ordered thanksgivings to be offered for his safe arrival; he enjoined the ministers to pray for him in their churches; and, without the smallest share of power, he enacted all the ceremonial of royalty, which served to throw an air of ridicule upon his pretensions. Having thus spent valuable time in useless parade, he next abandoned the enterprise with the same levity with which it was undertaken. He made a speech to his grand council, in which he informed them of his want of the money, arms, and ammunition necessary for undertaking a campaign; and deploring the necessity he was under of leaving them, he once more embarked on board a small French ship that lay in the harbour of Montrose, accompanied with several lords, his adherents, and in five days arrived at Gravelines.

The rebellion being thus ended, the law was put in force in all its rigour; and the prisons of London were crowded with deluded persons, whom the ministry seemed resolved not to pardon. The Commons, in their address to the crown, declared they would prosecute, in the most rigorous manner, the authors of the late rebellion; and their measures were as vindictive as their resolutions were speedy. The Earls of Derwentwater, Nithsdale, Carnwath, and Wintoun, the Lords Widrington, Kenmuir, and Nairne, were impeached; and, upon pleading guilty, all except Lord Wintoun received sentence of death. No entreaties could prevail on the ministry to spare these un-

Reign of
George I.

happy men. The House of Lords even presented an address to the throne for mercy, but without effect; the king only answered, that on this, as on all other occasions, he would act in the manner which he thought most consistent with the dignity of the crown and the safety of the people. Orders were accordingly issued for the execution of the Lords Derwentwater, Nithsdale, and Kenmuir, immediately: the rest were respited. Nithsdale, however, had the good fortune to escape in woman's clothes, which were brought him by his mother on the eve of the day fixed for his execution. Derwentwater and Kenmuir were brought at the time appointed to the scaffold on Tower Hill, where both underwent the sentence of the law with calm intrepidity, and apparently less moved than those who witnessed their execution.

An act of parliament was next passed for trying the private persons in London, and not in Lancashire, where they had been taken in arms. This was considered, by some of the best lawyers, as an alteration of the ancient constitution of the kingdom, according to which it used to be held, that every prisoner should be tried in the place where the offence charged against him had been committed. In the beginning of April, commissioners for trying the rebels met in the Court of Common Pleas, when true bills were found against Forster, brigadier Mackintosh, and twenty of their associates. Forster escaped from Newgate, and reached the Continent in safety; the rest pleaded not guilty to the charge. Pitts, the keeper of Newgate, having been suspected of conniving at Forster's escape, was tried for his life, but acquitted. Mackintosh and several other prisoners subsequently broke from Newgate, having mastered the keeper and turnkey, and disarmed the sentinel. The court then proceeded to the trial of the remainder, and four or five were hanged, drawn, and quartered, at Tyburn. The judges appointed to try the rebels at Liverpool found a considerable number of them guilty of high treason; twenty-two were executed at Manchester and Preston; while about a thousand experienced the king's mercy, and were transported to the plantations.

The rebellion being thus extinguished, the danger of the state was made a pretence for continuing the parliament beyond the term fixed for its dissolution. An act was therefore passed, repealing that which provided for the triennial dissolution of parliaments, and the term of their duration was extended to seven years. This attempt in a delegated body to increase their own power by extending it, is contrary to the first principles of justice. If it was right to extend their duration to seven years, they might also perpetuate their authority, and thus cut off even the shadow of representation. The bill, however, passed both houses, and all objections to it were considered as disaffection. The people might murmur at this encroachment, but it was too late for redress.

Domestic concerns being thus adjusted, the king resolved upon a voyage to the Continent. He foresaw a storm gathering from Sweden. Charles XII. highly provoked at his having entered into a confederacy with the Russians and Danes during his absence at Bender, and purchased from the king of Denmark the towns of Bremen and Verden, which constituted part of his dominions, maintained a close correspondence with the dissatisfied subjects of Great Britain; and a scheme was formed for landing a considerable body of Swedish forces, with the king at their head, in some part of the island, where it was expected they would be joined by all the malcontents in the kingdom. Count Gyllenburg, the Swedish minister in London, was peculiarly active in the affair; but having been seized, with all his papers, by order of the king, the confederacy was for the time broken up. A bill

was, however, passed by the Commons, prohibiting all commerce with Sweden, although the trade with that country was at the time of the utmost consequence to the English merchants. George having passed through Holland to Hanover, in order to secure his German dominions, entered into a new treaty with the Dutch and the Regent of France, by which they agreed mutually to assist each other in case of invasion; and, for his further security, the Commons granted him £250,000. But the death of the Swedish monarch, who was soon afterwards killed at the siege of Fredericsthal in Norway, put an end to all disquietude from that quarter.

Among the many treaties for which this reign was remarkable, one had been concluded, called the Quadruple Alliance, in which it was agreed between the emperor, France, Holland, and Britain, that the emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the Duke of Savoy; and that the succession to the duchies of Tuscany, Parma, and Placentia, should be settled on the queen of Spain's eldest son, in case the present possessors should die without male issue. This treaty, however, was by no means agreeable to the king of Spain; and it became prejudicial to the English, as it had the effect of interrupting the commerce with that kingdom. A war soon afterwards commenced between Spain and the emperor, who was considered as the principal contriver of the treaty; and a numerous body of Spanish forces were sent into Italy to support Philip's pretensions in that quarter. The regent of France attempted in vain to dissuade him, and the king of Britain offered his mediation with as little success, their interposition being considered as partial and unjust. A Spanish war was then resolved on, and a squadron of twenty-two ships equipped with all expedition. The command was given to Sir George Byng, who had orders to sail for Naples, which was at that time threatened by a Spanish army. He was received with the greatest joy by the Neapolitans, who informed him that the Spaniards, to the amount of thirty thousand, had then actually landed in Sicily. In this exigency, and whilst no assistance could be afforded by land, he resolved to proceed thither by sea, fully determined to pursue the Spanish fleet, on board of which the army was embarked. Upon coming round Cape Faro, he perceived two small Spanish vessels, and pursuing them closely, came upon their main fleet, which, before noon, he discovered in line of battle, amounting in all to twenty-seven sail. The Spaniards, however, notwithstanding their superiority of number, attempted to sheer off; but finding it impossible to escape, they kept up a running fight, the commanders behaving with great courage and activity, notwithstanding which they were all taken except three, which were saved by the conduct of their vice-admiral, a native of Ireland.

The rupture with Spain was thought favourable to the interest of the pretender; and it was hoped that, by the assistance of Cardinal Alberoni, a new insurrection might be excited in England. The Duke of Ormond was the person fixed upon to conduct this expedition; and he obtained from the Spanish court a fleet of ten ships of war and transports, having on board six thousand regular troops, with arms for twelve thousand more. But fortune was still as unfavourable as ever to the cause of legitimacy. Having set sail, and proceeded as far as Cape Finisterre, he encountered a violent storm, which disabled his fleet, and frustrated the expedition. This misfortune, together with the bad success of the Spanish arms in Sicily and other parts of Europe, induced Philip to agree to a cessation of arms; and at last he consented to sign the quadruple alliance, by which means peace was again restored to Europe.

Reign of
George I.

Reign of
George I.

Tranquillity being thus established, the ministry proceeded to take measures for securing the dependence of the Irish parliament upon that of England. One Maurice Annesley having appealed to the House of Peers of England from a judgment of the Irish Peers, the decree of the latter was reversed, and the British Peers ordered the Barons of Exchequer in Ireland to put Mr Annesley in possession of the lands which he had lost by the decree of the Lords in that kingdom. The Barons obeyed this order; but the Irish Peers passed a vote against them, as having attempted to diminish the just privileges of the parliament of Ireland, and at the same time ordered the barons to be taken into custody by the usher of the black rod. On the other hand, the House of Lords in England resolved that the Barons of Exchequer in Ireland had acted with courage and fidelity; and addressed the king to signify his approbation of their conduct by some marks of his favour; while, to complete their object, a bill was prepared by which the Irish House of Lords was deprived of all right of final jurisdiction. This bill was opposed in both houses, but particularly in the Commons, where it was asserted by Mr Pitt that it would only serve to increase the power of the English Peers, who were already but too formidable. Mr Hungerford also demonstrated that the Irish Lords had always exercised the power of finally deciding causes; but, in spite of all opposition, it was carried by a great majority, and soon afterwards received the royal assent.

This blow was severely felt by the Irish, but it was by no means so great as that which the English about this time received from the South Sea Scheme, which commenced in the year 1721. To understand the genesis of this delusion, it is necessary to observe, that ever since the Revolution, owing either to the insufficiency of the supplies granted by parliament, or to the time required for collecting those which were actually granted, the government was obliged to borrow money from several different companies of merchants; and among the rest from that which traded to the South Seas. In the year 1716 the government were indebted to this company upwards of nine millions sterling, for which interest at the rate of six per cent. was agreed to be paid. But as this company was not the only creditor of the government, Sir Robert Walpole formed a design of lessening the national debt, by giving the several associations which had advanced funds for the public service an alternative of either accepting a lower rate of interest, namely five per cent., or of being paid the principal. In point of fact, the different companies chose rather to accept of the reduced rate of interest than to be paid the principal; and the South Sea Company in particular, having advanced loans to the extent of ten millions, were contented to take £500,000 annually as interest, instead of £600,000, which they previously received. And in the same manner, the governors and company of the Bank, and other associations, consented to receive a diminished interest for their respective loans, which of course lessened considerably the burdens of the nation.

In this situation of things, one Blount, a scrivener, proposed to the ministry, in the name of the South Sea Company, to buy up all the debts of the different associations, in order that the South Sea Company might become the sole creditors of the state. The terms he offered to government were extremely advantageous. The South Sea Company was to redeem the debts of the nation out of the hands of the private individuals who were creditors to the government, upon such terms as could be agreed on; and for the interest of the money thus redeemed and taken into their own hands, they were to be allowed by government five per cent. for six years; after which the interest was to be reduced to four per cent. and to be at any time redeemable by parliament. For these purposes, accord-

ingly, a bill passed both houses of parliament. But now came the part of the scheme which was big with fraud and ruin. As the directors of the South Sea Company could not of themselves be supposed to possess money sufficient to buy up the debts of the nation, they were empowered to raise it by opening a subscription to an imaginary scheme for trading in the South Seas; and as immense advantages were promised from this supposititious commerce, and still greater expected by the rapacious credulity of the people, all the creditors of government were invited to come in and exchange their securities for that of the South Sea Company. The directors' books were accordingly no sooner opened for the first subscription, than crowds came to effect the exchange of government for South Sea stock; and the delusion was artfully propagated and continued. In a few days subscriptions or shares sold for double the price at which they had been purchased; the scheme succeeded beyond even the projector's hopes; and the whole nation was infected with a spirit of avaricious enterprise. The infatuation, in fact, became epidemic, and the stock rose to a surprising degree, even to a thousand per cent. premium on the original value or price of the shares. But after a few months the people awaked from their dream of riches, and found that all the advantages which they expected were purely visionary, whilst thousands of families were involved in utter ruin. Many of the directors, by whose arts the people had been taught to expect such benefits from a traffic to the South Seas, had indeed amassed enormous fortunes in consequence of the credulity of the public; but it was some consolation to the people, to find that the parliament, sharing in the general indignation, had resolved to strip these plunderers of their ill-gotten wealth. Accordingly, orders were first given to remove all the directors of the South Sea Company from their seats in parliament, and the places they held under government; and the principal delinquents were punished by a forfeiture of all such possessions and estates as they had acquired during the continuance of the popular frenzy. The next care of parliament was to afford some relief to the sufferers. Several just and proper resolutions were in consequence adopted, and a bill was speedily prepared for alleviating the sufferings of the people as far as the power of the legislature in such a case could possibly extend. Out of the profits arising from the South Sea scheme, the sum of seven millions was restored to the original proprietors; several additions were also made to their dividends out of what was possessed by the company in their own right; and the remaining capital stock was also divided among the former proprietors at the rate of thirty-three per cent. Petitions from all parts of the kingdom were in the meanwhile presented to the house, demanding justice; and the whole nation seemed exasperated to the highest degree. Public credit sustained a terrible shock. Some leading members of the administration were deeply implicated in these fraudulent transactions. A run was made upon the bank; and nothing was heard but the ravings of disappointment and the cries of despair.

By degrees, however, the effects of this terrible calamity wore off, and matters returned to their former condition. A new war with Spain, however, commenced in 1726. Admiral Hosier was sent to South America to intercept the Spanish galleons; but the Spaniards, apprised of his design, relanded their treasure, and thus defeated the object of the expedition. Meanwhile the greater part of the British fleet sent on this service was rendered entirely unfit for service. The seamen were cut off in vast numbers by the malignity of the climate and the length of the voyage, whilst the admiral himself died, it is said, of a broken heart. By way of retaliation the Spaniards undertook the siege of Gibraltar; but they soon found that this at-

Reign of
George I.

Reign of George II. tempt was hopeless; and France offering her mediation, a temporary peace ensued, although both sides only watched an opportunity for renewing hostilities with the prospect of success.

Soon after the dissolution of the parliament in the year 1727, the king, resolving to visit his electoral dominions of Hanover, appointed a regency to govern in his absence, and, embarking for Holland, landed at a little town called Voet. Next day he proceeded on his journey; and in two days more, betwixt ten and eleven at night, he arrived at Delden, to all appearance in perfect health. He supped there very heartily, and continued his journey early the next morning; but betwixt eight and nine he ordered his coach to stop; and it being perceived that one of his hands lay motionless, Fabrice, who had formerly been servant to the king of Sweden, and now attended King George in the same capacity, attempted to quicken the circulation by chafing the royal hand between his own. As this had no effect, however, the surgeon who followed on horseback was called, and rubbed it with spirits. But the friction was unavailing; the king's tongue began to swell, and he had just strength enough to bid them hasten to Osnaburgh; after which he fell insensible into Fabrice's arms. He never recovered; but expired about eleven o'clock the next morning, in the sixty-eighth year of his age and thirtieth of his reign. His body was conveyed to Hanover, and interred among his electoral ancestors.

CHAP. XI.

REIGN OF GEORGE II.

Accession of George II.—Court and Country Parties.—Charitable Corporation.—Excise Scheme rejected.—Parliament dissolved.—War with Spain.—Capture of Puerto Bello.—Anson's Expedition.—Unsuccessful attempt on Carthage.—Retirement of Sir Robert Walpole.—Army sent into Flanders.—Origin of the Continental War.—Desperate situation of the Queen of Hungary.—Relieved by the British forces.—Battle of Dettingen.—Intended invasion of Britain by France.—Battle of Fontenoy.—Capture of Louisbourg.—Landing of the Pretender in Scotland.—Battle of Gladsuir.—Advance into England.—Consternation in London.—Retreat of the Highland army from Derby.—Siege of Stirling Castle.—Battle of Falkirk.—Advance of the Duke of Cumberland, and retreat of the Rebels.—Battle of Culloden.—Cruelty of Cumberland.—Subsequent adventures and escape of Prince Charles Edward.—Execution of Rebels.—Policy of the Government in regard to the Highlands of Scotland.—Allies defeated in Flanders.—Losses sustained by the French in other parts.—Peace of Aix-la-Chapelle.—Death of the Prince of Wales.—Hostilities renewed.—Minorca invaded.—Execution of Admiral Byng.—Treaty with Russia.—Opposition of the King of Prussia.—New Combination of the European powers.—Unsuccessful expedition against France.—Accession of Mr Pitt to office.—Success of the British arms in both hemispheres.—Quebec taken and Canada reduced.—Misconduct of Cumberland in Germany.—Capitulation of Closter Seven.—French defeated at Minden.—German war continued with various success.—Death of George II.

On the accession of George II. who succeeded to his father in the forty-fourth year of his age, the two great parties into which the nation had so long been divided again changed their names, and were now called the Court and Country Parties. Throughout the greatest part of this reign there seem to have been two objects of controversy, which rose up in debate every session, and tried the strength of the opponents; namely, the national debt, and the number of forces to be kept in pay. The government, on the present king's accession, owed more than thirty millions of money; and although there was a long continuance of profound peace, yet this sum went on constantly increasing. How this could happen was much

Reign of George II. wondered at by the country party, and it was as constantly the business of the court to give plausible reasons for the increase. Hence demands for new supplies were made every session of parliament, for the purpose of securing friends upon the Continent, of guarding the kingdom from internal conspiracies, or of enabling the ministry to act vigorously in conjunction with the powers in alliance abroad. It was vainly alleged that these expences were incurred without foresight or necessity; and that the increase of the national debt, by multiplying and increasing taxes, would at last become an intolerable burden to the poor. These arguments were offered, canvassed, rejected; the court party was constantly victorious, and every demand was granted with equal cheerfulness and profusion.

The next thing worthy of notice in the reign of George II. is the Charitable Corporation. A society of men had united themselves into a company under this name, with the professed intention of lending money at legal interest to the poor upon small pledges, and to persons of higher rank upon proper security. Their capital was at first limited to thirty thousand pounds; but they afterwards increased it to six hundred thousand. This money was supplied by subscription, and the care of conducting the capital was intrusted to a proper number of directors. The company having continued in existence for more than twenty years, the cashier, George Robinson, member for Marlow, and the warehouse-keeper, John Thomson, disappeared in one day; and five hundred thousand pounds of capital were found to be sunk or embezzled by means which the proprietors could not discover. In a petition to the House, therefore, they represented the manner in which they had been defrauded, and the distress to which many of them had in consequence been reduced; and a secret committee having been appointed to examine into this grievance, a most iniquitous scene of fraud was discovered, which had been carried on by Thompson and Robinson, in concert with some of the directors, for embezzling the capital and cheating the proprietors. Many persons of rank and quality were concerned in this infamous confederacy; and even some of the first characters in the nation did not escape censure. No less than six members of parliament were expelled for the most sordid acts of knavery; Sir Robert Sutton, Sir Archibald Grant, and George Robinson, for their frauds in the management of the Charitable Corporation scheme; Dennis Bond and Serjeant Burch, for a fraudulent sale of the unfortunate Earl of Derwentwater's estate; and John Ward of Hackney, for the crime of forgery. It was at this time asserted in the House of Lords that not one shilling of the forfeited estates had ever been applied to the service of the public, but had become the reward of fraud, venality, and profligacy.

This happened in the year 1731. In 1732 a scheme was formed by Sir Robert Walpole of fixing a general excise; and he introduced it by enumerating the frauds practised by the factors in London employed in selling the American tobacco. To prevent these frauds, he proposed, that instead of having the customs levied in the usual manner, all the tobacco to be hereafter imported should be lodged in warehouses appointed for that purpose by the officers of the crown; and should from thence be sold, upon paying the duty of fourpence a pound, whenever the proprietor found a purchaser. This proposal raised a violent ferment, both within and without doors; and at last the fury of the people was worked up to such a pitch, that the parliament-house was surrounded by multitudes, who intimidated the ministry, and compelled them to abandon the scheme. The miscarriage of the bill was celebrated with public rejoicings in London and Westminster, and the minister was burned in effigy by the populace of London.

Reign of George II. On this occasion an attempt was made to repeal the septennial bill, and bring back triennial parliaments, as settled at the Revolution. But notwithstanding the warmth of the opposition, the ministry, exerting all their strength, proved victorious, and the motion was defeated. However, as on this occasion the country party seemed to have gained strength, it was thought proper to dissolve the parliament, and to summon another by the same proclamation.

But the same disputes were carried on in this as in the former parliament. New subjects of controversy offered every day, and both sides were eager to seize them. A convention agreed on by the ministry with Spain became an object of warm altercation. By this the court of Spain had agreed to pay ninety-five thousand pounds to the English, as a satisfaction for all demands, and to discharge the whole in four months from the day of ratification; but this stipulation was considered as not containing an equivalent for the damages which had been sustained, and which were said to amount to three hundred and forty thousand pounds. A violent discussion ensued, in the course of which the minister was provoked into unusual vehemence, and branded the opposite party with the appellation of traitors. But he was, as usual, victorious; and the country party finding themselves out-numbered and out-voted in every debate, resolved to withdraw for ever; while Walpole, thus left without opposition, took the opportunity of passing several useful laws in their absence, in order to render his opponents odious or contemptible to the country.

In 1739 a new war commenced with Spain. Ever since the treaty of Utrecht, the Spaniards in America had insulted and distressed the commerce of Great Britain; whilst the British merchants, on the other hand, had endeavoured to carry on an illicit trade with their dominions. As a right of cutting logwood in the Bay of Campeachy, claimed by the British, gave them frequent opportunities of introducing contraband commodities into the continent, the Spaniards resolved to put a stop to the evil by refusing liberty to cut logwood in that place. The guarda-costas exercised great severities, and many British subjects were sent to the mines of Potosi. One remonstrance followed another to the court of Madrid; but the only answers given were promises of inquiry, which produced no reformation. Accordingly, in 1739 war was declared with all proper solemnity; and soon after Admiral Vernon, with only six ships, destroyed all the fortifications of Puerto Bello, and came away victorious, with scarcely the loss of a man.

As the war was thus successfully begun, supplies were cheerfully granted to prosecute it with all imaginable vigour. Commodore Anson was sent with a squadron of ships to distress the enemy in the South Seas, and to co-operate occasionally with Admiral Vernon across the Isthmus of Darien. This squadron was designed to act a part subordinate to a formidable armament which was to be sent against Mexico or New Spain; but through the mismanagement of the ministry both these schemes were frustrated. Anson was detained till too late in the season, when he set out with five ships of the line, a frigate, two store-ships, and about fourteen hundred men. But having entered the South Sea at the most unfavourable period of the year, he encountered terrible storms; his fleet was dispersed, and his crew deplorably afflicted with scurvy, so that with the utmost difficulty he reached the island of Juan Fernandez. Here, however, he was joined by one ship and a frigate of seventeen guns, and sailing from thence along the coast of Chili, he plundered and burnt the town of Paita. He next traversed the Pacific, in hopes of meeting with one of the rich galleons which traded from the Philippine Islands to Mexico. Having refreshed his men at the island of Tinian,

Reign of George II. he set sail for China; and returning by the same route, he at last discovered the galleon, which he engaged and took; and with this prize, valued at upwards of three hundred thousand pounds, together with other captures to the value of about as much more, he returned home, after a voyage of three years. By this expedition the public sustained the loss of a fine squadron of ships, but a few individuals became possessed of immense fortunes.

Another expedition which was fitted out ended still more unfortunately. The armament consisted of twenty-nine sail of the line, and an almost equal number of frigates, furnished with all kinds of warlike stores, near fifteen thousand seamen, and as many land forces. The most sanguine hopes of success were entertained; but the ministry detained the fleet without any visible reason till the season for action in America was nearly past. At last, however, the squadron arrived before Carthagena, and soon captured the strong forts which defended the harbour. But though by this means they were enabled to approach nearer the town, they still found great difficulties before them. From an erroneous belief that the ships could not get near enough to batter the town, and that therefore the remaining forts must be attempted by escalade, this dangerous experiment was tried; but the guides were slain by the enemy's fire, and the forces, mistaking their way, instead of attempting the weakest part of the fort, attacked the strongest, where they were exposed to the fire of the whole town. Their scaling ladders were also too short; and at last, after sustaining a dreadful fire with great resolution for some hours, they retreated, leaving six hundred men dead on the spot. The ravages of the climate now began to prove more dreadful than the casualties of war; and the rainy season commenced with such violence, that it was found impossible for the troops to continue in their encampment. And, as if to aggravate these calamities, dissension arose between the commanders of the sea and land forces, who blamed each other, and at last could only be brought to agree in one mortifying measure, namely, the re-embarkation of the troops.

The miscarriage of this enterprise produced the greatest discontents, more especially as other causes of complaint occurred at the same time. Sir John Norris had twice sailed to the coast of Spain at the head of a powerful squadron, without effecting any thing of consequence. The commerce of Britain was greatly annoyed by the Spanish privateers, who had taken upwards of four hundred ships since the commencement of the war; whilst the British fleets remained quite inactive, and suffered one loss after another, without endeavouring in the least to make proper reprisals. These discontents burst out all at once against Sir Robert Walpole; a majority was formed in the House of Commons in opposition to the ministry of which he was the head; he was created Earl of Orford; and the parliament having adjourned for a few days on purpose, he resigned all his employments.

The removal of this minister gave universal satisfaction. His antagonists entertained great hopes of seeing him punished; but he had laid his schemes too well to be under any apprehensions on that account; and, in fact, the new ministry had no sooner got into office than they trode in the footsteps of those whom they had so much exclaimed against. The nation had now become disgusted with naval operations. The people desired a renewal of their victories in Flanders, and the king ardently joined in the same wish. An army of sixteen thousand men was therefore shipped and sent to Flanders, to take part in the quarrels that were then beginning to break out on the Continent. Immense triumphs were expected from this undertaking; but it was somehow forgotten that the army was not now commanded by John Duke of Marlborough.

Reign of
George II.

In order to give some notion of the origin of these continental disputes, it is necessary to go back for several years. After the Duke of Orleans, regent of France, died, Cardinal Fleury undertook to settle the confusion in which the kingdom was then involved; and under him France repaired her losses, and enriched herself by means of commerce. During the long interval of peace which this minister's counsels had procured for Europe, two powers, hitherto disregarded, began to attract the notice and the jealousy of the neighbouring nations. These were Russia and Prussia, both of which had been gradually rising into power and consequence. The other states were but little prepared to renew the war. The empire remained under the government of Charles VI. who had been placed on the throne by the treaty of Utrecht; Sweden continued to languish, from the destructive projects of Charles XII.; Denmark was powerful enough, but inclined to peace; and part of Italy still remained subject to those princes who had been imposed upon it in consequence of foreign treaties. All these states, however, continued to enjoy profound peace, until the death of Augustus king of Poland; an event by which a general flame was once more kindled in Europe. The emperor, assisted by the arms of Russia, declared for the elector of Saxony, the son of the deceased king; whilst France, on the other hand, espoused the cause of Stanislaus, who had long ago been nominated king of the Poles by Charles of Sweden, and whose daughter the king of France had since married. Stanislaus was gladly received at Dantzic, and acknowledged as king of Poland; but having been besieged there by ten thousand Russians, the city was taken, and he himself with difficulty made his escape. France, however, still resolved to assist him, as the most effectual method of distressing the house of Austria; and her views were seconded by Spain and Sardinia, both of which hoped to be enriched by the spoils of Austria. A French army, therefore, overran the empire, under the conduct of the old Marshal Villars; whilst the Duke of Montemar, the Spanish general, was equally victorious in the kingdom of Naples. The emperor was soon obliged to sue for peace, which was granted; but Stanislaus was neglected in the treaty, it having been stipulated that he should renounce all claim to the kingdom of Poland; while the emperor gratified France with the duchy of Lorraine, and other valuable territories, as an indemnification.

The emperor dying in the year 1740, the French thought the opportunity favourable for their ambition, and, regardless of treaties, particularly that called the Pragmatic Sanction, by which the late emperor's dominions were settled upon his daughter, caused the Elector of Bavaria to be crowned emperor. Thus the queen of Hungary, daughter of Charles VI. was at once stripped of her inheritance, and left for a whole year without any hopes of success; and at the same time she lost the province of Silesia by an irruption of the young king of Prussia, who took the opportunity of her defenceless condition to renew his pretensions to that province. France, Saxony, and Bavaria, attacked the rest of her dominions; and Britain was the only ally who seemed willing to assist her; but Sardinia, Holland, and Russia, soon afterwards concurred in the same views. It must be owned that the only reason which Britain had for interfering in these disputes was, that the security of the electorate depended upon nicely balancing the different interests of the empire; but the ministry were nevertheless willing to gratify the king by engaging the country in a war. His majesty informed the parliament that he had sent a body of British forces into the Netherlands, which he had augmented by sixteen thousand Hanoverians, to operate a diversion on the side of France, in favour of the queen of Hungary. But when the supplies by which this additional number of Hanoverian troops was to

receive pay from Britain for defending their own cause came to be considered, violent parliamentary debates ensued; and although the ministry carried their point by the strength of numbers, they had but little reason to boast of their victory.

Yet, however prejudicial these continental measures might be to the true interests of Great Britain, they effectually retrieved the queen of Hungary's affairs, and soon turned the scale of victory in her favour. The French were driven out of Bohemia; while her general, Prince Charles of Lorraine, at the head of a large army, invaded the dominions of Bavaria. Her rival, the nominal emperor, was obliged to fly before her; and, abandoned by his allies, as well as stripped of his hereditary dominions, he retired to Frankfort, where he lived in obscurity. Meanwhile the British and Hanoverian army advanced in order to effect a junction with that under Prince Charles, by which they would have outnumbered their enemies; and to prevent this the French opposed an army of sixty thousand men, upon the Maine, under the command of Marshal de Noailles, who posted his troops on the eastern side of that river. The British army was commanded by the Earl of Stair, who, although he had learned the art of war under Eugene and Marlborough, suffered himself to be inclosed by the enemy on every side, near a village called Dettingen; and in this situation the whole army, with the king himself, who had by this time arrived in the camp, must have been taken prisoners, had the French behaved with ordinary prudence. But their impetuosity saved the combined force from destruction. They passed a defile which they ought to have contented themselves with guarding, and, under the conduct of the Duke de Grammont, their horse charged the British foot with great fury; but they were received with unshaken firmness, and at last obliged to repass the Maine with precipitation, and the loss of about five thousand men. The British monarch, who was present in the battle, displayed equal courage and conduct, and in some measure atoned for an error which might otherwise have proved fatal.

But though the British were victorious in this engagement, the French were very little disconcerted by it. They opposed Prince Charles, and interrupted his attempts to pass the Rhine; and in Italy they also gained some advantages; but their chief hopes were placed on an intended invasion of England. From the violence of parliamentary disputes in England, France had been persuaded that the country was ripe for a revolution, and only wanted the presence of the pretender to bring about a change. An invasion was therefore projected; the troops destined for the expedition amounted to fifteen thousand; and preparations were made for embarking them at Dunkirk and some of the ports nearest to England, under the eye of the young pretender. The Duke de Roquefeuille, with twenty ships of the line, was to see them safely landed on the opposite shore; and the famous Count Saxe was to command them when disembarked. But the whole project was disconcerted by the appearance of Sir John Norris, with a superior fleet, which obliged the French squadron to put back; while a severe gale of wind damaged their transports, and thus entirely frustrated the scheme of a sudden descent. But the national joy for Sir John Norris's success was soon damped by the miscarriage of Admirals Mathews and Lestock, who, through a misunderstanding, suffered a French fleet of thirty-four sail to escape them near Toulon.

In the Netherlands the British arms were also attended with ill success. The French had there assembled an army of a hundred and twenty thousand men, commanded by Count Saxe, natural son of the late king of Poland, and an officer of great experience. The English were under

Reign of
George II.

son of the Duke of Cumberland, whose army was much inferior in number to that of the enemy, whilst in point of knowledge of war the disparity between him and the French general was still greater. Count Saxe, therefore, carried all before him. In the year 1743 he besieged Fribourg, and in the beginning of the campaign of 1744 he invested the strong city of Tournay. To save the place, if possible, the allies resolved to hazard an engagement; and this brought on the memorable battle of Fontenoy. The French were posted behind the town of that name, on some eminences which completely commanded the defile which formed the only approach to the position. At two in the morning the assailants quitted their camp, and about nine the British infantry, formed in a kind of grand square, attacked the centre of the enemy's line, which was drawn up in a sort of avenue to receive them. But from the confined nature of the ground, the obstinacy of the resistance in front, and the flanking fire kept up from some woody heights which domineered over the defile, this fine body of troops was never able to develop its attack nor to clear the defile; yet, in spite of every effort of the enemy, it maintained its ground till three in the afternoon, preserving its formation unbroken, notwithstanding the plunging fire of the French artillery, and the concentrated musketry of their infantry, to which it was without intermission exposed; and at last it retired in perfect order, facing round at intervals, and checking the pursuit of the enemy. The loss of the allies amounted to twelve thousand men, and that of the French was even greater; but the victory nevertheless gave them the superiority during the rest of the campaign, as well as during the remainder of the war. The capture of Tournay was the first fruit of this dear-bought success; and though the Elector of Bavaria, whom they had proclaimed emperor, was now dead, the French were too much elated by success to relax in their operations against the allies.

To balance the defeat at Fontenoy, however, Admirals Rowley and Warren retrieved the honour of the British flag, and made several rich captures at sea. The fortress of Louisbourg, a place of great consequence to the British commerce, surrendered to General Pepperel; and a short time afterwards two French East India ships, and a Spanish ship from Peru laden with treasure, put into the harbour, supposing it still their own, and were taken.

During this gleam of returning success, Charles Edward, the son of the old pretender to the British crown, resolved to make an attempt to recover what he called his right. Being furnished with some money from France, he embarked for Scotland on board of a small frigate, accompanied by the Marquis of Tullibardine, Sir Thomas Sheridan, and some others; and for the conquest of the whole British empire, he only brought with him seven officers, and arms for two thousand men. Fortune, however, seemed nowise more favourable to this attempt than to others similar to it. His convoy, a ship of sixty guns, was so disabled in an engagement with an English man of war, that it was obliged to return to Brest, whilst he continued his course to the western parts of Scotland. On the 27th of July 1745 he landed on the coast of Lochaber, and was in a little time joined by the Highlanders to the number of fifteen hundred men. The ministry at first could scarcely be induced to credit the story of his arrival; but when it could no longer be doubted, they sent Sir John Cope with a small body of forces to oppose his progress. A favourable opportunity offered for striking a blow at Corryarrick; but Cope, who seems to have been equally devoid of conduct and of energy, withdrew to Inverness, thus uncovering the road to the low country.

The young adventurer, availing himself of this blunder, immediately marched to the south, and arrived at

Perth, where he performed the ceremony of proclaiming his father king of Great Britain. He then proceeded towards Edinburgh, and, his forces continually increasing, entered the capital without opposition; but he was unable, from want of cannon, to reduce the castle. Here he again proclaimed his father; and promised to dissolve the union, which was still considered as one of the national grievances. In the mean time Sir John Cope, having arrived from Inverness, and been reinforced by two regiments of dragoons, resolved to give battle to the enemy. The insurgents, however, attacked him at Gladsmuir, near Prestonpans, and in a few minutes put him and his troops to flight, with the loss of five hundred men. This victory gave the insurgents great hopes, from the impression it produced; and had the pretender marched directly to England, the result might perhaps have been fatal to the House of Hanover. But he was amused by the promise of succours which in fact never arrived, and thus induced to remain in Edinburgh till the season for action was lost. He was joined, however, by the Earl of Kilmarnock, Lord Balmerino, Lords Cromarty, Elcho, Ogilvy, Pittligo, and the eldest son of Lord Lovat, who with their vassals considerably increased his army; and Lord Lovat himself, so remarkable for his treachery, was favourably disposed towards the pretender, although unwilling to act openly for fear of the government. But whilst Charles was thus trifling away his time at Edinburgh, the British ministry were taking most effectual methods to oppose him. Six thousand Dutch troops, which had come over to assist the government, were dispatched northward under the command of General Wade; but this force was then in some measure incapable of acting, being prisoners of France upon parole, and under engagements not to oppose that power for a year. Be this as it may, however, the Duke of Cumberland arrived soon afterwards from Flanders, and was followed by a detachment of dragoons and infantry, well disciplined and inured to action; whilst volunteers offered their services in every part of the kingdom.

At last Charles resolved upon an irruption into England. He entered that country by the western border, and took the town of Carlisle; after which he continued his march southwards, having received assurances that a considerable body of forces would be landed on the southern coasts to create a diversion in his favour. He established his head-quarters at Manchester, where he was joined by between two and three hundred English formed into a regiment under the command of Colonel Townley; and thence he pursued his march to Derby, intending to go by the way of Chester into Wales, where he hoped to be joined by a great number of malcontents; but in this he was prevented by the factions among his followers.

Having now advanced within a hundred miles of London, that capital was thrown into the utmost consternation; and had he proceeded with the same expedition which he had hitherto used, he might perhaps have made himself master of it. But he was prevented from pursuing this or any other rational plan by the discontents which began to prevail in his army. The young pretender was in fact but the nominal leader of his forces; and his generals, the Highland chiefs, were equally averse to subordination and ignorant of command. They now, however, became unanimous in their resolution to return to their own country; and Charles was forced to comply. Accordingly they retreated to Carlisle without sustaining any loss; and thence crossing the Eden and Solway, entered Scotland. They next marched to Glasgow, which was laid under severe contributions; and thence proceeding to Stirling, they were joined by Lord Lewis Gordon at the head of some forces which had been assembled in his absence. Other clans likewise came in; while some supplies of money re-

Reign of
George II.

ceived from Spain, and some skirmishes with the royalists, in which he was victorious, caused the pretender's affairs to assume a much more promising aspect. Being joined by Lord Drummond, he invested the castle of Stirling, in the siege of which much valuable time was consumed to no purpose. General Hawley, who commanded a considerable body of forces near Edinburgh, undertook to raise the siege, and with this view advanced as far as Falkirk in order to give battle to the Highland army. After some time spent in mutual observation, an engagement ensued on the 17th January 1746, in which the king's troops were entirely defeated. The Highlanders advanced to the attack with their usual impetuosity, threw in a volley or two, and then drawing their claymores, rushed forward, sword in hand, to close with the enemy. The onset proved irresistible; infantry and cavalry were intermingled in one common rout; and the whole artillery and tents of the royal army fell into the hands of the conquerors.

But the victory of Falkirk was the last of the triumphs of the rebel army. The Duke of Cumberland having arrived, put himself at the head of the troops at Edinburgh, amounting to about fourteen thousand men; and with these he marched to Aberdeen, where he was joined by several of the nobility attached to the house of Hanover, the enemy in the mean time retreating before him. He next advanced to the banks of the Spey, a deep and rapid river, where the Highlanders might have successfully disputed his passage; but their mutual contentions had now risen to such a height that they could scarce agree in any thing. At last, however, they resolved to make a stand, and for this purpose selected Drummoissie Muir, near Culloiden, nine miles distant from Inverness; the only ground in the whole country where cavalry and artillery, the two arms which they had most reason to dread, could act with effect against them. Their numbers amounted to about eight thousand; and after an abortive attempt to surprise the royal army at Nairn, they returned to their position and drew out to receive the attack. At one in the afternoon of the 15th of April 1746, the cannonading commenced; and whilst the artillery of the rebels, from being miserably served, did little or no execution, that of the royal army, at every discharge, made frightful gaps in the Highland ranks. During the continuance of the cannonade, Cumberland observing that the right of the Highlanders was covered by a wall, ordered a body of men to advance and pull it down. The Campbells, to whom this service was committed, promptly obeyed the order; and the right wing of the Highlanders being thus uncovered, they became exposed to a flanking fire as well as to that in front, which was now kept up with the greatest vivacity. In this trying situation a body, chiefly Atholmen, about nineteen hundred strong, unable any longer to sustain the galling fire which was poured in on their ranks, and conscious that their real strength lay in close combat, advanced to the attack sword in hand; broke through Burrell's and Monro's regiments in an instant; and pressed on, with diminished numbers but dauntless resolution, against the second line of the royal army, amidst a concentrated and terrible fire from every gun that could be brought to bear upon them. The second line steadily awaited the onset of this forlorn hope, reserving their fire till it came quite close, when a destructive volley was thrown in, while Wolfe's regiment, formed *en potence*, opened at the same instant a flanking fire. The force of the charge was thus completely broken; a few and but a few of the assailants escaped; and the bravest, who did not fall by the murderous fire, perished in a desperate conflict with the English bayonets. Lochiel, advancing at the head of a small band, who had survived the encounter with the first line, was wounded in both ankles by a grape-shot while in the act of charging the second

line; and in this state he was carried off the field by his two brothers, between whom he had advanced. Macdonald of Keppoch was also rushing on in like manner to the attack, when, receiving a wound which brought him to the ground, he was conjured by a friend not to throw away his life, but to retire and rejoin the main body; but desiring his friend to provide for his own safety, Macdonald got upon his legs, and, whilst preparing again to advance, received another shot, by which he fell to rise no more. Most of the chiefs who commanded the body that advanced to the charge, and almost every man in the front ranks, were killed. Unfortunately the Highland regiments on the left did not advance to close combat, or support the gallant attack which has just been described: had they done so, the issue might have been very different. After exchanging a volley or two with the right wing of the duke's army, and answering the fire of some dragoons who hovered near, they retreated, and separating into small parties, were cut up in detail, losing more men in proportion than the brave band who had made so gallant and vigorous an effort to retrieve the fortune of the day. In less than thirty minutes the battle was lost, and with it a final period was put to all the hopes of the young adventurer. The conquerors behaved with the greatest cruelty, refusing quarter to the wounded, the unarmed, and the defenceless; and some were slain who had only been spectators of the combat; whilst soldiers were seen to anticipate the base employment of the executioner. The duke, immediately after the action, ordered thirty-six deserters to be executed; the conquerors spread terror wherever they went; and in a short time the whole country around became one dreadful scene of plunder, slaughter, and desolation.

Immediately after the battle, the pretender fled with a captain of Fitzjames's cavalry; and when their horses were fatigued, they both alighted, and separately sought for safety. There is a striking resemblance between the adventures of Charles II. after the battle of Worcester, and those of the pretender after the battle of Culloiden. For several days he wandered through the country; sometimes he found refuge in caves and cottages, without any attendants at all; sometimes he lay in forests with one or two companions of his distress, continually pursued by the troops, there being a reward of £30,000 offered for taking him either dead or alive. In the course of his adventures he had occasion to trust his life to the fidelity of above fifty individuals, not one of whom could be prevailed on, even by so great a reward as that which was offered, to betray him whom they looked upon as the son of their king. For six months the unfortunate Charles continued to wander in the mountains of Glengarry, often hemmed round by his pursuers, but still rescued, by some providential accident, from the impending danger. At length a privateer of St Maloes, hired by his adherents, having arrived in Lochranach, he embarked on board that vessel for France. At this time he was reduced to a state of inexpressible wretchedness, being clad in a short coat of black frize, threadbare, over which was a common Highland plaid girt round him by a belt, from which hung a pistol and dagger. He had not been shifted for many weeks; his eyes were hollow, his visage was wan, and his constitution greatly impaired by famine and fatigue. Accompanied by Sullivan and Sheridan, two Irish adherents, who had shared all his calamities, together with Cameron of Lochiel, his brother, and a few other exiles, he set sail for France, and, after having been chased by two English men of war, arrived in safety at a place called Roseau, near Morlaix, in Bretagne.

While the pretender was thus pursued, the scaffolds and gibbets were preparing for his brave adherents. Seventeen officers were hanged, drawn, and quartered, at Kenning-

sign of ton Common, in the neighbourhood of London; nine were executed in the same manner at Carlisle, and eleven at York. A few obtained pardons, and a considerable number of the common men were transported to America. The Earls of Kilmarnock and Cromarty, and Lord Balmerino, were tried and found guilty of high treason. Cromarty was pardoned, but Kilmarnock and Balmerino were executed; as was also Mr Radcliffe, brother to the Earl of Derwentwater, who received sentence upon a former conviction. Lord Lovat was tried, and suffered some time afterwards.

Immediately after the suppression of the rebellion, the legislature undertook to establish regulations in Scotland, conducive to the happiness of the people and the tranquillity of the united kingdoms. The Highlanders had till that time continued to wear the military dress of their ancestors, and never went without arms; in consequence of which they considered themselves as a body of people distinct from the rest of the nation, and were ready upon the shortest notice to second the projects of their chiefs. Their habits were now reformed by an act of legislature, and they were compelled to wear clothes of the common fashion. But what contributed still more to destroy the spirit of clanship was the abolition of the hereditary jurisdictions which their chieftains exercised over them. The power of the chiefs was totally destroyed, and every subject in that part of the kingdom was liberated from the state of vassalage in which they had formerly lived.

Soon after the battle of Culloden the Duke of Cumberland proceeded to Flanders, where he resumed the command of the army, to which he was by no means equal. The French carried every thing before them, and reduced under their dominion all the strong places which had been taken by the Duke of Marlborough, and formed a barrier to the united provinces. They gained a considerable victory near Rocoux, though at a great sacrifice of men, which, however, they could easily spare, as they were much more numerous than their adversaries; and another victory which they obtained at Lafeldt served to depress still further the spirit of the allied army. But the taking of Bergen-op-Zoom, the strongest fortification of Brabant, was the event which naturally reduced the Dutch to the greatest alarm and distress.

These victories and successes in Flanders, however, were counterbalanced by almost equal disappointments. In Italy, the brother of Marshal Belleisle, attempting to penetrate into Piedmont at the head of thirty-four thousand men, was defeated and killed. A fleet had been fitted out for the recovery of Cape Breton, but without success; and two others were equipped, the one to make a descent upon the British colonies in America, and the other to carry on the operations in the East Indies; but these were attacked by Anson and Warren, and nine of their ships taken. Soon after this, Commodore Fox, with six ships of war, took above forty French ships richly laden from St Domingo; and about the same time the French fleet was defeated by Admiral Hawke, who took seven ships of the line and several frigates.

For a long time Louis had been desirous of peace, and this desire he even expressed to Sir John Ligonier, who had been taken prisoner at the battle of Lafeldt. But now the bad success of his admirals at sea, and his armies in Italy, the frequent bankruptcies of his merchants at home, and the election of a stadtholder in Holland, who gave spirit to the opposition;—all these contributed to make him weary of the war, and to propose terms of accommodation. This was what the allies had long wished for, but had been ashamed to demand. A congress was therefore held at Aix-la-Chapelle, and a treaty concluded, by which it was provided that all prisoners on each side should be mu-

tually given up, and all conquests restored; that the duchies of Parma, Placentia, and Guastalla, should be ceded to Don Philip, heir-apparent to the Spanish crown, and after him return to the house of Austria; that the fortifications of Dunkirk towards the sea should be demolished; that the British ship annually sent with slaves to the coast of New Spain should have this privilege continued for four years; that the king of Prussia should be confirmed in the possession of Silesia; and that the queen of Hungary should be secured in the possession of her patrimonial dominions. But the most mortifying clause was, that the king of Great Britain should, immediately after the ratification of this treaty, send two persons of rank to France as hostages, until restitution should be made of Cape Breton and all other British conquests during the war. No mention whatever was made of the searching of British vessels in the American seas, though this was the original cause of the quarrel; the limits of their respective possessions in North America were not ascertained; nor did they receive any equivalent for those forts which they had restored to the enemy.

In the year 1751 Frederick prince of Wales died of a pleurisy, which was not thought at first to be in any way dangerous. He was much regretted, for his good-nature had rendered him popular, and those who opposed the present administration had grounded their hopes of redress upon his accession to the throne.

Some time before this, in the year 1749, a scheme had been entered upon, from which the nation in general anticipated great advantages; namely, encouraging those who had been discharged from the army or navy to become settlers in Nova Scotia, a country cold, barren, and almost incapable of cultivation. Nevertheless, on account of this barren spot, the English and French actually renewed the war. The possession of this country was reckoned necessary for the defence of the English colonies to the north, and for preserving their superiority in the fisheries in that part of the world. The French, however, who had been long settled in the back parts, resolved to use every method to dispossess the new comers, and spirited up the Indians to begin hostilities. Another source of dispute also sprung up in the same part of the world. The French, pretending to have first discovered the mouth of the river Mississippi, claimed the whole adjacent country towards New Mexico on the east, and to the Apalachian Mountains on the west; and, in order to assert their claims, as they found several English who had settled beyond these mountains, they dispossessed them of their new settlements, and built such forts as were calculated to command the whole country round about. Negotiations and mutual accusations were followed by hostilities; and in 1756 four operations were undertaken by the British in America at once. Colonel Monkton had orders to drive the French from the province of Nova Scotia; General Johnson was sent against Crown Point; General Shirley against Niagara, to secure the forts on the river; and General Braddock against Fort du Quesne. In these expeditions Monkton was successful; Johnson was also victorious, though he failed in taking the fort against which he was sent; Shirley was thought to have lost the season of operation by delay; and Braddock was defeated and killed.

But, in return for this failure of success, the British made reprisals at sea; and here they were so successful that the French navy was unable to recover itself during the continuance of the war. The first measure of the French was to threaten an invasion. Several bodies of their troops were sent down to the coasts opposite Britain, and these were instructed in the manner of embarking and relanding from flat-bottomed boats, which were made in great numbers for the purpose. The number of men amounted

Reign of
George II.

Reign of
George II.

to fifty thousand, but all discovered the utmost reluctance to the undertaking. The ministry were greatly alarmed, and applied to the Dutch for six thousand men, which they were by treaty obliged to furnish in case of invasion. But this supply was refused, the Dutch alleging that their treaty was to send the troops in case of an actual, and not of a threatened, invasion. The king, therefore, finding he could not reckon upon the Dutch forces till their assistance would be too late, desisted entirely from his demand; and the Dutch with great cordiality returned him thanks for withdrawing his request. Upon this ten thousand Hessians and Hanoverians were brought over; a proceeding which occasioned great discontent. The ministry were reviled for such disgraceful conduct, as if the nation was unable to defend itself; whereas the people only demanded a vigorous exertion of their own internal strength, and then feared no force that could be led to invade them.

The threatened invasion, however, never took place. But a French army landed in Minorca, and invested the citadel of St Philips, which was reckoned the strongest in Europe, but the garrison was nevertheless weak, and nowise fitted to stand a vigorous siege. To raise this siege, Admiral Byng was dispatched with a squadron of ten men of war, with orders to relieve Minorca, or at any rate to throw a body of troops into the garrison. But this last he reckoned too hazardous an undertaking, nor did he even attempt it; and soon afterwards a French fleet appeared nearly equal in force to his own, when he resolved to act only on the defensive. The French advanced, and a slight engagement ensued with part of the English fleet; after which the enemy slowly withdrew, and no other opportunity occurred of coming to a close engagement. Upon this it was resolved in a council of war to return to Gibraltar to refit, and agreed that the relief of Minorca was impracticable. For such pusillanimous, if not treacherous conduct, Byng was brought home under arrest, tried, condemned to death, and shot. He suffered with the greatest resolution, after delivering a paper filled with protestations of his innocence as to any treacherous intention.

After the conquest of Minorca, the French declared that they would revenge all injuries which they might sustain in their colonies on the king of Britain's dominions in Germany. Upon this the court of London, eager to preserve Hanover, entered into a treaty with the court of Russia, by which it was stipulated that a body of fifty thousand Russians should be ready to act in the British service, in case Hanover should be invaded by the French; for which the Czarina was to receive L.100,000 annually, to be paid in advance. But the treaty was opposed by the king of Prussia, who had long considered himself as guardian of the interests of Germany, and was therefore alarmed at a treaty which threatened to deluge the empire with an army of barbarians. Besides, he was already apprised of an agreement between the Austrians and Russians, by which the latter were to enter the empire and strip him of his late conquest of Silesia. He therefore declared that he would not suffer any foreign forces to enter the empire, either as auxiliaries or principals; so that the king of Britain found himself obliged to drop his Russian connection, and conclude a treaty with the king of Prussia. As both monarchs wished only to prevent the invasion of Germany, they soon came to an agreement to assist each other mutually; and from this alliance a new combination took place among the European powers, quite opposite to the former one. Britain opposed France in America, Asia, and on the ocean. France attacked Hanover, which the king of Prussia undertook to protect; whilst Britain promised him troops and money to assist his operations. Austria having aims on the dominions of Prussia, drew the Elector of Saxony into the same designs; and in these views the

Austrians were seconded by France, Sweden, and Russia, ^{Reign of George II.} who had hopes of acquiring a settlement in the west of Europe.

Thus the king of Prussia launched into the tumult of war, having only the king of Britain for his ally; whilst the most powerful states of Europe were his antagonists. He now performed a series of exploits which, taken as a whole, are not surpassed in the annals of modern times, and of which a particular account will be given in the article PRUSSIA. The British ministry, in order to create a diversion in his favour, planned an enterprise against the coast of France; but the destination of the fleet equipped for this purpose was kept a profound secret. At last, however, it appeared before Rochefort, where the commanders, having trifled away their time in deliberating how to proceed, took the little island of Aix, an easy and useless conquest, and soon afterwards returned home without attempting any thing else. By this miscarriage the ministry were so discouraged that they had thoughts of abandoning the king of Prussia to his fate; and the king was actually meditating a negotiation of this nature, when he was prevented by the expostulations of his distressed ally. From motives of generosity, therefore, more than of interest, it was resolved to continue to assist him; and success, which had long fled from the British arms, once more began to return with double splendour.

It was in the East Indies where this return of good fortune first manifested itself; but the British conquests in the western part of the world speedily eclipsed those in the eastern. These successes must, in part at least, be ascribed to the vigorous administration of Mr William Pitt, who about this time came into power. An expedition was set on foot against Cape Breton, under General Amherst and Admiral Boscawen; another under General Abercrombie, against Crown Point and Ticonderago; and a third under Brigadier-General Forbes, against Fort du Quesne. The fortress of Louisbourg, which defended the island of Cape Breton, was strong both by nature and art; the garrison was numerous, the commander vigilant, and every precaution had been taken to prevent a landing; but the activity of the British surmounted every obstacle; and the place having been surrendered by capitulation, its fortifications were demolished. The expedition against Fort du Quesne was equally successful; but that against Crown Point once more miscarried. General Abercrombie attacked the French in their intrenchments, but was repulsed with great slaughter, and obliged to retire to his camp at Lake George. But though in this respect the British arms were unsuccessful, yet, upon the whole, the campaign of 1758 ended greatly in their favour. The taking of Fort du Quesne served to remove from their colonies the terror of the incursions of the Indians, whilst it interrupted the communication along a chain of forts with which the French had environed the British settlements in America; and the succeeding campaign promised still greater success.

In 1759 it was resolved to attack the French in several parts of their territory at once. General Amherst, with a body of twelve thousand men, was commanded to attack Crown Point; General Wolfe was to undertake the siege of Quebec; whilst General Prideaux and Sir William Johnson were to attempt a French fort near the cataracts of Niagara. This last expedition was the first that succeeded. The siege was begun with vigour, and promised an easy conquest; but General Prideaux being killed in the trenches by the bursting of a mortar, the command devolved on General Johnson. A body of French troops, sensible of the importance of the place, attempted to relieve it, but were utterly defeated and dispersed; and soon afterwards the garrison surrendered prisoners of war. On his arrival at the forts of Crown Point and Ticonderago, Ge-

General Amherst found them deserted and destroyed. There now remained, therefore, but one decisive blow to be struck in order to reduce the whole of North America under the British dominion; namely, by the capture of Quebec, the capital of Canada. This expedition was commanded by Admiral Saunders and General Wolfe. The enterprise was attended with difficulties which appeared insurmountable; but all these were overcome by the admirable conduct of the general, and the great bravery of his men. He engaged and put to flight the French under Montcalm; but, to the great regret of the British, he was killed in the action nearly at the same instant that his adversary also fell. The surrender of Quebec was the consequence of this victory, and it was soon followed by the cession of all Canada. The next season, indeed, the French made a vigorous effort to recover the city; but by the resolution of Governor Murray, and the appearance of a British fleet under the command of Lord Colville, they were obliged to abandon the enterprise. The whole province was soon after reduced by the prudence and activity of General Amherst, who obliged the French army to capitulate; and it has ever since remained as a dependency of the British empire. About the same time also the island of Guadaloupe was reduced by a force under Commodore More and General Hopson.

At the beginning of the war the British affairs in Germany had worn a very unfavourable aspect. The Hanoverians were commanded by the Duke of Cumberland, who, greatly outnumbered by the enemy, was obliged to retire beyond the Weser. The passage of this river by the enemy might have been disputed with success; but the French were suffered to effect it unmolested. The Hanoverians were then driven from one part of the country to another, till at length they made a stand near a village called Hastenbach, where it was hoped the numbers of the enemy would not avail them in a general engagement. The Hanoverians, however, left the field of battle to the French, after a feeble resistance. The latter pursued, and the duke retired towards Stade; by which means he marched into a country where he could neither procure provisions nor attack the enemy with any prospect of success. And here, being unable either to escape or advance, he was compelled to sign a capitulation, by which the whole army laid down their arms, and were afterwards dispersed into different cantonments. By this disgraceful surrender, which was called the capitulation of Closter Seven, Hanover was obliged to submit quietly to the French, and the latter were thus left at full liberty to turn their arms against the king of Prussia.

Soon after this capitulation, both sides began to complain that the treaty had not been strictly observed. The Hanoverians exclaimed against the rapacity of the French general and the brutality of his soldiers. The French retorted the charge, accusing the Hanoverians of insolence and insurrection; and being sensible of their own superiority, resolved to bind them strictly to their terms of agreement. The Hanoverians, however, only wished for a pretence to take arms, and for a general to head them; and neither was long wanting. The oppressions of the tax-gatherers whom the French had appointed were considered as so severe, that the army rose to vindicate the freedom of their country; and Prince Ferdinand of Brunswick put himself at its head. As soon as this became known in Britain, large supplies were granted, both for the service of the king of Prussia, and for enabling the Hanoverian army to act vigorously in conjunction with him. A small body of British forces was sent over to join Prince Ferdinand under the Duke of Marlborough; but after some considerable successes at Crevelt, the Duke of Marlborough died, and the command of the British forces devolved on Lord

George Sackville. A misunderstanding, however, arose between him and Prince Ferdinand, the effects of which appeared at the battle of Minden, that was fought shortly after. Lord George, who commanded the British cavalry, pretended that he could not understand the orders sent him by the prince, and of consequence did not obey them. The allies gained the victory, but it would have been more decisive had the British commander obeyed his orders. He was soon after recalled, tried by a court-martial, found guilty of disobedience, and declared incapable of serving in any military command for the future. After this victory it was generally imagined that one reinforcement more of British troops would terminate the war in favour of the allies; and that reinforcement was accordingly sent. The British army in Germany was augmented to upwards of thirty thousand men, and sanguine hopes of conquest were generally entertained. But these hopes proved to be ill founded. The allies were defeated at Corbach, but retrieved the honour of their arms at Exdorf. A victory at Warbourg followed shortly after, and this was succeeded by another at Zierenberg. But they suffered a reverse at Compen; after which both sides retired into winter quarters.

On the 25th of October 1760 died George II. He had risen at his usual hour, and observed to his attendants, that as the weather was fine, he would take a walk into the garden of Kensington, where he then resided. But in a few minutes after his return, being left alone, he was heard to fall heavily on the floor; and the noise bringing his attendants into the room, they lifted him into bed, when he desired in a faint voice that the Princess Amelia might be sent for; but before she could reach the apartment his majesty expired, in the seventy-seventh year or his age and thirty-third of his reign. An attempt was made to bleed him, but without effect; and afterwards the surgeons, upon opening him, discovered that the right ventricle of the heart had been ruptured, and a great quantity of blood discharged through the aperture.

affairs.—Boston Port Bill.—Repeal of the Tea-duty refused.—Administration of Justice Bill.—Quebec Bill.—Lord Chatham's motion for the recall of the troops.—Petitions of various kinds, and debates thereon.—Chatham's Scheme of Conciliation rejected.—Address on the American papers.—Violent debates.—New England Restraining Bill.—The American fisheries.—War resolved on.

King George III. ascended the throne amidst the greatest successes both by sea and land. At this time, indeed, the efforts of Britain in every quarter of the globe were truly astonishing. The king of Prussia had received a subsidy; a large body of English forces commanded the extensive peninsula of India; another army of twenty thousand men confirmed the conquests in North America, while thirty thousand were employed in Germany; and a great many more were dispersed in garrisons in different parts of the world. But all this was surpassed by the naval force, which carried every thing before it, and totally annihilated the French maritime power. The courage and conduct of the English admirals excelled every thing that had been heard of before; neither superior force, nor numbers, nor even the terrors of the tempest, could intimidate them. Admiral Hawke gained a complete victory over an equal number of French ships in Quiberon Bay on the coast of Bretagne, in the midst of a storm, during the darkness of night, and, what a seaman fears still more, in the neighbourhood of a rocky shore.

When his majesty had met his parliament, which was on the 18th November 1760, he confirmed the hopes of his allies, and gave assurances of his intention to prosecute the war with vigour. By this time, however, the people were weary of conquests, especially those in Germany; and the general current of popular opinion seemed adverse to the German war. But for some time no change took place in the method of carrying it on. In 1761, however, proposals of peace were interchanged among the belligerent powers of Europe; but the French, designing to draw Spain into a confederacy with them, were not sincere in their intentions; and in this way the treaty came to nothing. An enterprise was projected against Belleisle, on the coast of France, which was conducted by Commodore Keppel and General Hodgson, and terminated in the capture of the island, with the loss of eighteen hundred men killed and wounded on the part of the British; and however unimportant such a conquest might be, the rejoicings on account of it were great. In Germany, however, the campaign was unsuccessful on the part of the allies. At first, indeed, they drove the French out of the territory of Hesse, and laid siege to the city of Cassel; but being defeated at Stangerod, they were forced to raise the siege, retire behind the Dymel, and again abandon Hesse to the enemy, after which they were followed and attacked by the French; and though the latter were defeated, they could with difficulty be prevented from making themselves masters of Munster and Brunswick.

During all this time appearances of negotiation were kept up; but at length M. Bussy, on the part of France, delivered to Mr Pitt a private memorial, signifying, that, in order to establish peace on a lasting foundation, the King of Spain might be induced to guarantee the treaty; and to prevent the differences which then subsisted between Britain and Spain from producing a fresh war in Europe, it was proposed, that in this negotiation the three points which had been disputed between the crown of England and Spain might be finally settled. These were, first, the restitution of some captures made upon the Spanish flag; secondly, a recognition of the privilege of the Spanish nation to fish upon the banks of Newfoundland; and, thirdly, the demolition of the English settlements in the Bay of Honduras. But this memorial was returned as wholly inadmissible. Mr Pitt declared that

it would be looked upon as an affront to the dignity of his master, and incompatible with the sincerity of the negotiation, to make any further mention of such a circumstance. Being now convinced of the sinister designs of Spain, this minister also proposed immediately to declare war against that country. But the proposal being rejected, he resigned his employment of secretary of state; upon which he was created Earl of Chatham, and had a pension of L.3000 per annum settled upon him for three lives.

The new administration, however, soon found that Mr Pitt was in the right; and war was accordingly declared against Spain. As Portugal was the ally of Britain, the French and Spaniards resolved to attack that kingdom, which was then in no condition to defend itself. The Portuguese monarch was haughtily commanded to accede to the confederacy against Britain, and threatened with the vengeance of France and Spain in the event of refusal. It was in vain that he promised to observe a strict neutrality, and urged the obligations he was under to the king of Britain. This moderate and reasonable representation only led to more haughty and insulting demands. His Portuguese majesty, however, continued to reject their proposals in the most resolute manner; and concluded his last declaration by stating, that it would affect him less to be reduced to the last extremity, than to sacrifice the honour of his crown, and all that Portugal held most dear, by submitting to become an unheard-of example to all pacific powers, which would no longer be able to enjoy the benefit of neutrality, whenever a war should be kindled between other powers with which the former were connected by defensive treaties. This declaration was issued on the 27th of April 1762; and soon afterwards France and Spain jointly declared war against Portugal.

As the design of the courts of France and Spain in making war with Portugal was professedly to deprive Great Britain of the military and commercial use of the harbours of that kingdom, their principal endeavours were directed against the two great ports of Oporto and Lisbon. With this view, three inroads were to be made; one to the north; another more to the south; and the third in the intermediate provinces, in order to sustain the other two bodies, and preserve a communication between them. The first body of troops was commanded by the Marquis of Savaria, and entering by the north-east of Portugal, marched towards Miranda, which he entered on the 9th of May, through the breaches made by the accidental explosion of a powder magazine. From Miranda the invaders marched to Braganza, which speedily surrendered; and Moncorvo was in like manner taken. They became masters of nearly the whole of the extensive province of Tras os Montes; and every thing being clear before them to the banks of the Douro, Oporto was given up for lost, and the admiralty prepared transports to carry off the effects of the British merchants. But on the Douro the career of this body was stopped by the peasants, who, animated and guided by some British officers, seized a difficult pass, and drove the enemy back to Moncorvo. The second body of Spaniards entered the province of Beira, and being joined by strong detachments, immediately laid siege to Almeida, which surrendered on the 25th of August. The Spaniards then pushed forward to Castello Branco, and marching to the southward, approached the banks of the Tagus. During the whole of their progress, and indeed throughout the whole campaign, Great Britain and Portugal had nothing that deserved the name of an army in the field; and all that could be done was by the defence of passes, by skirmishes, and by surprises. The third Spanish army had assembled on the frontiers of Estremadura, with the design of invading the province of Alentejo; and if this body of troops had been joined to the others, they would probably, in spite of all opposition,

Reign of
George II.

have forced their way to Lisbon itself; whilst by acting separately, it might have so distracted the defenders of the country as to enable the other invading forces to penetrate to that city. The Count of La Lippe Buckeburg, therefore, having arrived in Portugal, resolved if possible to prevent their entrance into that kingdom; and with this view he dispatched Brigadier-general Burgoyne to attack an advanced body of Spaniards which lay on the frontier in the town of Valentia de Alcantara. On the 27th of August the town was surprised, and the general who was to have commanded the invading force taken, together with one colonel, two captains, and seventeen subaltern officers, whilst one of the best regiments in the Spanish service was also entirely destroyed, and the enemy thus prevented from entering Alentejo. That part of the Spanish army which acted in the neighbourhood of Castello Branco having made themselves masters of several important passes, the combined army of British and Portuguese pretended to retire before them, in order to draw them into the mountainous tracts. They attacked the rear of the allies, but were repulsed with loss; yet they still continued masters of the country, and nothing remained but the passage of the Tagus to enable them to take up their quarters in the province of Alentejo. But this the count designed to prevent; and accordingly he employed General Burgoyne, who having formed a design of surprising them, committed the execution of it to Colonel Lee. In the night of the 6th of October this officer fell upon their rear, dispersed the whole body with considerable slaughter, destroyed their magazines, and returned with scarcely any loss. The season was now far advanced; immense quantities of rain fell; the roads were destroyed; and the Spaniards having obtained possession of no advanced post where they could maintain themselves, and being unprovided with magazines, fell back to the frontiers of their own country.

Nor were the British arms less successful in America and the East Indies. From the French were taken the islands of Martinico, St Lucia, St Vincent, and Grenada; from the Spaniards the strong fortress called Havana, in the island of Cuba. The conquest of the latter cost a number of brave men, more of whom were destroyed by the climate than by the enemy. But it was at this place that the fleets from the several parts of the Spanish West Indies, called the galleons and flota, assembled before they finally set out on their voyage for Europe; and the acquisition of it, therefore, united all the advantages which can be acquired in war. Nine of the enemy's men of war, with four frigates, were taken; three of their best ships had been sunk in the harbour at the beginning of the siege; and two more in great forwardness on the stocks were destroyed. In money and valuable merchandises the spoil did not fall short of three millions sterling. To this success in the western world may be added the capture of the Spanish register-ship called the *Hermione*, by the *Active* and *Favourite* king's ships. This happened on the 21st of May 1762, just as the *Hermione* was entering one of the ports of Old Spain; and the prize was valued at little short of a million sterling. In the East Indies an expedition, undertaken against the Philippine Islands, was committed to Colonel Draper, who arrived on this service at Madras in the latter end of June 1762. The seventy-ninth regiment was the only regular corps that could be spared for the expedition; but every thing was conducted with the greatest celerity and judgment. The British forces landed at Manilla on the 24th of September; on the 6th of October the governor was obliged to surrender at discretion; and soon after, the galleon bound from Manilla to Acapulco, laden with rich merchandise to the value of more than half a million, was taken by the

frigates *Argo* and *Panther*. By the conquest of Manilla there fell into the hands of the British fourteen considerable islands, which, from their extent, fertility, and convenience for commerce, were of the greatest importance. By this acquisition, joined to the successes in the western hemisphere, Britain secured every avenue of the Spanish trade, and interrupted all communication between the different parts of the vast but unconnected empire of Spain.

During this time the war in Germany had continued with the utmost violence; but although the allies under Prince Ferdinand had given the highest proofs of valour, no decisive advantage had been obtained over the French. It was, however, no longer the interest of Britain to continue a destructive contest. There never had been a period so fortunate or glorious for this island. In the course of the war she had conquered a tract of continent of immense extent. Her American territory approached to the borders of Asia, and the frontiers of the Russian and Chinese dominions. She had conquered twenty-five islands, all of them distinguishable for their magnitude, their riches, or the importance of their situation; by sea and land she had gained twelve battles, and reduced nine fortified cities, and about forty castles or forts; she had taken or destroyed above a hundred ships of war from her enemies, and acquired at least ten millions in plunder. Conquests so extensive and ruinous to the French and Spaniards naturally rendered them desirous of a peace, which was at length concluded at Paris on the 10th of February 1763. The terms granted, and which many thought too favourable, were, in substance, that the French king should relinquish all claims to Nova Scotia; that he should likewise give up the whole country of Canada; and that for the future the boundary betwixt the British and French dominions in America should be fixed by a line drawn along the middle of the river Mississippi from its source to the river Ibberville, and thence by a line along the middle of this river, and the Lakes Maurepas and Pontchartrain, to the sea. The islands of St Pierre, Miquelon, Martinico, Guadaloupe, Marigalante, Desirade, St Lucia, and Belleisle, were restored to France; whilst Minorca, Grenada, and the Grenadines, St Vincent, Dominica, and Tobago, were ceded to Great Britain. In Africa, the island of Goree was restored to France; and the river Senegal, with all its forts and dependencies, ceded to Great Britain. In the East Indies, all the forts and factories taken from the French were restored. In Europe, the fortifications of Dunkirk were to be destroyed; and all the countries, fortresses, and posts, belonging to the Electorate of Hanover, the Duke of Brunswick, and the Count of La Lippe Buckeburg, restored. In regard to Spain, the British fortifications on the Bay of Honduras were to be demolished; and the Spaniards were to desist from their claim of right to fish on the Newfoundland bank. The Havana was restored, in consequence of which Florida, St Augustine, and the Bay of Pensacola, were ceded to Britain; the Spaniards were to make peace with Portugal; and all other countries not particularly mentioned were to be restored to their respective owners at the beginning of the war.

The conclusion of the war did not by any means tend to heal those divisions which had arisen on the resignation of Mr Pitt; on the contrary, it furnished abundant matter of complaint for the discontented party, whose views at that time seem to have been the embarrassment and disturbance of an administration which they were unable to subvert. When the treaty was under consideration, however, only some faint attempts were made to oppose it; but it soon appeared, that though this opposition had proved so feeble, the spirit of the party was far from being exhausted. The actual state of affairs indeed favoured the views of those who delighted in turbulence and

Reign of George III.

Reign of George III. in faction. A long and expensive war had drained the national treasure, and greatly increased the public debt; whilst heavy taxes had already been imposed, and it was still as necessary to keep them up, and even to impose new ones, as though the war had not ended. Thus the bulk of the nation, who imagined that conquest and riches ought to go hand in hand, were easily induced to believe the administration arbitrary and oppressive, seeing it continued to load them with fresh taxes after such great successes as had for some years past attended the British arms. And indeed it must be owned, that the new administration appear not to have been sufficiently wary in this respect. Amongst various methods of raising the supplies for 1763, they had recourse to a duty of four shillings per hogshead upon cyder, payable by the maker, and to be collected in the same manner as the rest of the excise duties. The other articles of supply, as well as the duty in question, furnished matter of declamation for the members in opposition; but this inflamed the popular fury to a great degree, and made the people readily receive as truth whatever was said by the minority in the parliamentary debates. Besides the usual declamations, the smallness of the sum to be raised by it was particularly urged. This, it was said, showed that the supplying of the wants of government could not be the sole motive for imposing such a duty; and it was further urged, that now the houses of all orders of people, noblemen of the first rank not excepted, were liable to be entered and searched at the pleasure of excisemen, a proceeding which was denominated a badge of slavery. This was the language held throughout all the cyder counties, by the city of London, and by most of the incorporations throughout the kingdom; and in short the whole nation was thrown into a violent ferment. The friends of administration, indeed, urged plausible arguments in favour of their scheme; but the utmost force of reason will go only a very little way in quieting popular clamour; and whilst opposition was railing against ministry within doors, every method was taken to excite the fury of the people without. Virulent libels, the audacity of which far exceeded any thing known in former times, now made their appearance; and such was the general intemperance in this respect, that it would be difficult to determine which side paid least regard to any kind of decency or decorum.

In the midst of this general ferment, the Earl of Bute unexpectedly resigned his office of first lord of the treasury; and his resignation immediately became an object of general speculation. By some he was highly censured for leaving his friends at a time when a little perseverance might have defeated all the designs of his enemies, and established his own power on the most solid foundation. Such conduct, it was said, must discourage the friends of government, and at the same time give proportional encouragement to its adversaries to insult it. Others contended that the earl was very little, if at all, influenced by popular opinion. He had demonstrated his firmness by taking a lead in the difficult but necessary affair of concluding peace; and this being accomplished, he had fully obtained his end, and performed the service to his country which was required of him. The event, however, showed that the former reasoning was nearest the truth. The popular resentment was not in the least abated by the resignation of his lordship, who, though now withdrawn from the ostensible administration of affairs, was still considered as principal director of the cabinet; and this opinion gained the more ground that none of the popular leaders were called into office, nor any apparent change made in the conduct of the new administration.

No reasonable objection could now be taken to those who filled the great offices of state. Mr Grenville, who

succeeded the Earl of Bute in the treasury, was a man of approved integrity, understanding, and experience. Lord Holland was universally considered as a very able man in office, and had already filled many high employments with a great degree of reputation. The other secretary, Lord Egremont, though he had not been long in office, was in every respect of an unexceptionable character. The rest of the departments were filled in a similar manner; yet the discontents and public clamours were not diminished. It was now alleged that the new ministers were not chosen on account of any superior gifts of nature or fortune, but merely because they had the art of insinuating themselves into favour at court; that the sole reason of their appointment was, that they might act as the passive instruments of the late minister, who, though he had thought proper to retire from office, had not yet abandoned his ambitious projects, but continued to direct every thing as if he had still been in power; that opposition to the new ministers was therefore opposition to him; and that it became those who understood the true interest of their country, and had a real regard to it, not to suffer such a scheme of clandestine administration.

Whether the party who made these assertions really believed them or not cannot be known; but the effect was exactly the same as if they had. The great object of both parties was power; but their different situations required that they should profess different political principles. The friends of Lord Bute, and of the succeeding administration, were for preserving to the crown the full exercise of the power of choosing its own servants. Their opponents, without denying this power, contended that, according to the spirit of the constitution, the crown should be directed in its exercise by motives of national utility, and not by private friendship. In appointing the officers of state, therefore, they insisted that respect should be paid to those who, possessing great talents, had done eminent services to the nation, who enjoyed the confidence of the nobility, and had influence amongst the landed and mercantile interests. The observance of this rule, they contended, was the only proper counterpoise against the enormous influence of the crown arising from the possession of so much patronage; nor could the nation be reconciled to such a power by any other means than a very popular use of it. Men might indeed be appointed according to the strict letter of the law; but unless these were persons in whom the majority of the nation already put confidence, they never would be satisfied, nor think themselves secure against attempts on the constitution of the kingdom.

In the mean time the disposition to libel and invective seemed to proceed beyond all bounds. The peace, the Scots, and the administration supposed to be directed by Scottish influence, afforded such subjects of abuse to the pretended patriots, that ministry resolved at last to make an example of one of them by way of deterring the rest from such licentiousness. For this purpose they made choice of the paper called the *North Briton*, which, in language somewhat superior to most other political productions of the time, had abused the king, the ministry, and the Scots, in an extravagant manner. One particular paper (No. xlv.) was deemed by those in power to be actionable; and John Wilkes, member for Aylesbury, was supposed to be the author of it. A warrant was therefore granted for apprehending the author, printer, and publishers, of this performance, but without mentioning Wilkes's name; nevertheless three messengers entered the house of that person on the night between the 29th and 30th of April 1763, with an intention to seize him. He objected, however, to the legality of the warrant, because his name was not mentioned in it, and likewise to the lateness of the

hour; and on being threatened with violence, the messengers thought proper to retire for the night. Next morning he was apprehended without making any resistance, though some violence was necessary to get him into a hackney-coach, which carried him before the secretaries of state for examination. On the first intimation of Wilkes's being in custody, application was made for a *habeas corpus*; but as this could not be sued out till four in the afternoon, several of his friends desired admittance to him, which was, however, refused on pretence of an order from the secretaries of state. But the order, though repeatedly demanded, could not be produced, or at least was not so; and on this account the gentlemen, conceiving that they were not obliged to pay any regard to messengers acting only by a verbal commission, entered the place where he was without further hesitation.

This illegal step was followed by several others in rapid succession. Wilkes's house was searched, and his papers seized in his absence; and though it was certain that a *habeas corpus* had now been obtained, he was nevertheless committed to the Tower. Here not only his friends, but several noblemen and gentlemen of the first distinction, were denied access to him; nor was his brother even allowed to see him. On the third of May he was brought before the Court of Common Pleas, where he made a speech, setting forth the great love he had for his majesty, the bad conduct of ministry, and especially his own grievances, alleging that he had been treated worse than a Scotch rebel. His case having been argued by several eminent lawyers, he was remanded to the Tower for three days; after which he was ordered to be brought up, that the affair might be finally settled. Next day Lord Temple received a letter from Secretary Egremont, informing him that the king judged it improper that Wilkes should continue any longer a colonel of the Buckinghamshire militia; and soon afterwards Temple himself was removed from the office of lord-lieutenant of that county. Meanwhile the judges decided that the warrant of a secretary of state was in no respect superior to that of a common justice of peace; that Wilkes's commitment was illegal; that his privilege as a member of parliament had been infringed; that this could not be forfeited except by treason, felony, or breach of the peace, none of which was imputed to him; and that a libel, even though it had been proved, had only a tendency to disturb the peace, without amounting to any actual breach of it. It was therefore resolved to discharge him; and the prisoner was accordingly set at liberty.

Wilkes having thus regained his freedom, resolved to make all the advantage he could of the errors committed by the ministry, and to excite as general a ferment as possible. For this purpose he wrote an impudent letter to the Earls of Egremont and Halifax, informing them that his house had been robbed, affirming that the "stolen goods" were in the possession of one or both of their lordships, and insisting upon immediate restitution. This letter was printed, and many thousand copies of it were dispersed; and soon afterwards an answer by the two noblemen was published in the newspapers, stating the real cause of the seizure of Wilkes's papers. The North Briton now again made its appearance, and the popular party were elated beyond measure with their success; whilst those who had suffered by general warrants sought redress at law, and commonly obtained damages far beyond their most sanguine expectations. During the whole summer, the minds of the people were kept in continual agitation by political pamphlets and libels of various kinds, whilst the affair of general warrants engrossed the general attention.

On the meeting of parliament his majesty mentioned in his speech the attempts which had been made to divide the people; and before the addresses could be moved in re-

turn, a message was sent to the Commons, informing them of the supposed offence of Wilkes, and of the proceedings against him, while the exceptionable paper was also laid before the house. After warm debates, the North Briton was voted a false, scandalous, and seditious libel, tending to excite traitorous insurrections; and this was followed by a declaration that the privilege of parliament does not extend to the writing and publishing of seditious libels. The paper in question was therefore condemned and ordered to be burnt by the hangman; but this was not done without great opposition from the mob.

Wilkes, now determined to make the best use of the victory he had gained, commenced a prosecution in the Court of Common Pleas against the under secretary of state, for seizing his papers; and the cause being determined in his favour, the defendant was subjected in L.1000 damages, with full costs of suit. The prosecution with which Wilkes had been threatened was now carried on with great vigour; but in the mean time, having grossly affronted Mr Martin, member for Camelford, by his abusive language in the North Briton, he was challenged by that gentleman, and dangerously wounded in the belly. Whilst he lay ill of his wound, the House of Commons put off his trial from time to time; but beginning at last to suspect that there was some collusion betwixt him and his physician, they ordered Dr Heberden, and Mr Hawkins, an eminent surgeon, to attend him, and report. Wilkes, however, did not think proper to admit these gentlemen; and soon afterwards took a journey to France. The Commons being informed that he had refused to admit the physician and surgeon sent by them, now lost all patience; and proceeding against him in absence, he was expelled the house. A prosecution was also commenced against him before the House of Lords, on account of an obscene and blasphemous attack on a spiritual peer; and failing to appear and answer the charges against him, he was outlawed. But the severity shown to Wilkes did not at all extinguish the spirit of the party. A general infatuation in favour of licentious and abusive writings seemed to have taken place. At the very time that Wilkes was found guilty of publishing the infamous pamphlet above mentioned, the common council of London presented their thanks to the city representatives for their zealous and spirited endeavours to assert the rights and liberties of the subject; and in gratitude to Lord Chief Justice Pratt for his decision in Wilkes's affair, they presented him with the freedom of the city, and desired him to sit for his picture, which was to be placed in Guildhall.

But these clamours did not prevent administration from paying attention to the exigencies of the nation. The practice of franking blank letters had risen to an incredible height, and greatly prejudiced the revenue. The hands of members of parliament were counterfeited, and the covers publicly sold without the least scruple; and besides, the clerks of the post office claimed a privilege of franking, which extended even further than that of the members of the house. An act was accordingly passed for remedying the evil, by restricting the practice within reasonable limits. At this time it was proved that the annual postage of letters sent free amounted to L.70,000, and that the profits accruing to the clerks of the post office amounted to between L.800 and L.1700 each. Among the other plans for augmenting the revenue, were those for settling the island of St John, and for the sale of the lately acquired American islands. The former was proposed by the Earl of Egremont, who presented a memorial to his majesty on the subject. The sale of the conquered lands, consisting of the islands of Grenada, the Grenadines, Dominica, St Vincent, and Tobago, took place in March 1764. Sixpence an acre was to be paid as a quit-rent for cleared

Reign of
George III.

lands, and a penny a foot for ground-rent of tenements in towns, and sixpence an acre for fields; but no person was to purchase more than three hundred acres in Dominica, or five hundred in the other islands. Amongst the most remarkable transactions of this year was the renewal of the charter of the bank, for which the latter paid the sum of £1,100,000 into the exchequer as a present to the public, besides advancing a million of money to government upon the security of exchequer bills.

But by far the most momentous affair which, at this time, occupied the attention of government, was the consideration of a project for raising a revenue from the American colonies. This had formerly been proposed to Sir Robert Walpole; but that prudent minister wisely declined to enter into such a dangerous scheme; observing, that he would leave the taxation of the colonies to those who came after him in office. The reason given for such a proceeding was the necessity of defraying the charge of defending them; and this, though extremely reasonable in itself, was effected in such a manner as raised a flame which could only be extinguished by the total overthrow of the authority of the parent state. Before this time, indeed, hints had been thrown out that it was not impossible for the colonists to withdraw their dependence on Britain; and some disputes had taken place betwixt the different provinces, which, although quieted by terror of the French, seemed to augur no good. But now, when the colonies were not only secured but extended, it was thought proper to make the experiment whether they would be obedient or not. They already contained more than two millions of people, and it was deemed absolutely necessary to raise a revenue from so numerous a body. Some thought it might be dangerous to provoke them; but to this it was replied by administration, that the danger must increase by forbearance, and that, as taxation was indispensable, the sooner the experiment was tried the better. The fatal trial being thus determined on, an act was accordingly passed for the prevention of smuggling, in order that the duties laid on the American trade might come into the hands of government. At this time there was carried on betwixt the British and Spanish colonies an illicit traffic, which seemed to bid defiance to all law and regulation, and which was no less obnoxious to the Spanish than to the British government. In some respects, however, the suppression of this commerce was very inconvenient to the colonists; for as the balance of trade with Britain was against them, they found it impossible to procure any specie except by trading with the Spaniards, who paid for their goods in gold and silver. This, with another act requiring them to pay certain duties in cash, was probably the cause of the resentment shown by the Americans to government, and their refusal to submit to the stamp act, which was also passed in the course of this year, having been carried through the Commons by a great majority.

The disposition to augment the revenue by all possible methods seems to have served to keep alive the general opinion as to the oppressive and arbitrary measures pursued by government. The ill humour of the British patriots still continued; and the stamp bills were received in America with the utmost indignation. The arguments for and against American taxation are at present of little importance, excepting in as far as concerns the constitutional question evolved by them, and now almost universally admitted, that taxation without representation is tyranny; and the particulars of the opposition of the colonists will be related under another head. We may however observe here, that the resistance of the colonists proved very distressing to the mother country, on account of the immense sums due by the former. To the merchants of London alone they were indebted to the extent of

four millions sterling; and so ready had the latter been to give them credit, that some of the American legislatures passed acts against incurring such debts for the future. A petition on the subject was also presented to the House of Commons; but as it denied the parliamentary right of taxation, it was not allowed to be read. It was then proposed, on the part of administration, that the agents should join in a petition to the house that they might be heard by counsel in behalf of their respective colonies against the tax; but the agents not thinking themselves empowered to prefer such a petition, the negociation was broken off, and matters went on in America as we have elsewhere related.

In other respects, the ministry took such steps as they judged necessary for supporting the honour and dignity of the nation. Some encroachments having been made by the French and Spaniards, remonstrances were made to their respective courts, and satisfaction obtained; and though every trifling was sufficient to set on the popular party, they were as yet unable to find any just cause of complaint. Nevertheless, the disposition to tumult and insurrection seems to have become general. The silk-weavers residing in Spitalfields being distressed for want of employment, arising, it was thought, from the clandestine importation of French silks, laid their case before his majesty in the year 1764, and the sufferers were relieved by the bounty of the public; but this seemed to render matters worse, by confirming them in habits of indolence and idleness. At the same time a bill, which was believed to be calculated to conduce to their benefit, having been thrown out, they began to assemble in great numbers, and several disorders were committed; nor was it without the assistance of the soldiery, and the utmost vigilance of the magistrates, that the riot could be suppressed. During this disturbance the ferment between the court and popular parties continued unabated, and ministers were still reviled in numberless publications, as mere dependents and tools of the Earl of Bute.

An event which now occurred, however, produced a considerable revolution at court, though it had but little effect in calming the minds of the people. This was the illness which seized the king in the beginning of the year; and whilst it filled the public mind with apprehensions, produced a bill for settling the affairs of the kingdom in case of the crown devolving on a minor. In adjusting this bill, ministers were said to have acted with but little respect to the Princess-dowager of Wales, in excluding her from a share of the government; and this proceeding was thought to have in a great measure alienated the confidence of his majesty, with whom the ministry had hitherto been in great favour. Nor did their subsequent conduct prove that they were at all desirous of regaining the ground which they had lost. For having contrived to get the Earl of Bute's brother turned out of a lucrative office he enjoyed in Scotland, they offended his majesty, without recommending themselves to the popular party in England, who manifested a perfect indifference as to all that passed in Scotland. On this occasion Lord Chatham is said to have been solicited to accept the office which he had formerly filled so much to the satisfaction of the nation, and to have declined it. A new ministry, however, was soon formed, on the recommendation of the Duke of Cumberland. The Duke of Grafton, and Mr Conway, brother to the Earl of Hertford, were appointed secretaries of state; the Marquis of Rockingham, first lord of the treasury; and Mr Dowdeswell, chancellor and under treasurer of the exchequer. The office of lord privy seal was conferred on the Duke of Newcastle; and the other places were filled with men of known integrity, and supposed to be agreeable to the people. These changes, however, did not give general

Reign of
George III.

Reign of satisfaction. The opinion that affairs were still managed by the Earl of Bute continued to prevail, and was industriously kept up by the political writers of the time; and the city of London expressed their discontent on the occasion of addressing his majesty upon the birth of a third son. This could not fail to offend both king and ministry; but before the latter could show any token of resentment, they lost their friend and patron the Duke of Cumberland who died on the 31st of October 1765. He had been that evening assisting at one of the councils, then frequently held, in order to put matters in a way of being more speedily dispatched by the privy council; and being seized with a sudden disorder of which he had shown some symptoms the evening before, he fell senseless in the arms of the Earl of Albemarle, and expired almost instantaneously.

In the mean time the discontents which had inflamed the American colonies continued also to agitate the minds of the people of Great Britain; nor indeed was it reasonable to expect that they could be satisfied with their present condition, commerce being nearly annihilated, manufactures at a stand, and provisions exorbitantly high priced. The large sums due to British merchants by the Americans also severely affected the trading and manufacturing part of the country; more especially as the colonists refused to pay unless the obnoxious laws should be repealed. The administration, therefore, were under the necessity of either enforcing the stamp act by the sword, or of procuring its immediate repeal in parliament. The loss of the Duke of Cumberland was now severely felt, as he had been accustomed to assist the ministry with his advice, and was respected by the nation for his good sense. But it seems doubtful if at this period human wisdom could have prevented the consequences which ensued. The administration endeavoured to avoid the two extremes, of rushing instantly into a civil war, or sacrificing the dignity of the crown or nation by irresolution and weakness; and suspended their decision until certain intelligence should be received from the American governors as to the state of affairs in that country. But the opposite party animadverted severely on this conduct, insisting on the most coercive methods being immediately adopted for enforcing the laws in which they themselves had had so great a share. Pacific measures, however, prevailed, and the stamp act was repealed; but at the same time another was passed, declaring the right of parliament not only to tax the colonies, but to bind them in all cases whatsoever. The repeal of the stamp act occasioned universal joy throughout Britain and America, though, as parliament insisted upon their right of taxation, which the opposite party denied, matters were still as far from any real accommodation as ever; and the ill humour of the Americans was soon afterwards increased by the duties laid upon glass, painters' colours, and tea imported into their country; whilst at home the high price of provisions, and some improper steps taken by ministry to remedy the evil, kept up the general outcry against them.

In this state of affairs administration were once more disturbed by the appearance of John Wilkes, who had returned from exile, and, on the dissolution of parliament in 1768, whilst his outlawry was still unreversed, stood candidate for the city of London. Failing, however, in his design of representing the city of London, he instantly declared himself a candidate for Middlesex. Innumerable tumults and riots immediately took place; and so great was the animosity betwixt the two parties, that a civil war seemed to be threatened. Any particular detail of these transactions would, however, be superfluous. It is sufficient to state, that on a trial the outlawry of Wilkes was reversed, and he was condemned for his offences to pay a fine of £1000, and to be imprisoned for twelve months. Idolized

by the people, however, and powerfully supported by merchants and persons of property, he was repeatedly chosen member for Middlesex, and as often rejected by the House of Commons. Tumults frequently occurred; and the interposition of the military was construed by the patriots as indicative of a design to establish ministerial authority by the most barbarous methods.

These dissensions did not pass unnoticed by the other European powers, particularly the French and Spaniards. Both had applied themselves with assiduity to the increase of their marine; and many began to prognosticate an attack from one or other or both of these nations. The Spaniards first showed an inclination to come to a rupture with Britain. The subject in dispute was a settlement formed on the Falkland Islands, near the southern extremity of the American continent. A scheme of this kind had been thought of as early as the reign of Charles II., but it was not till after Lord Anson's voyage that any serious attention had been paid to it. In the printed account of this expedition, his lordship pointed out the danger incurred by our navigators through the treachery of the Portuguese in Brazil, as well as the importance of discovering some place more to the southward, where ships might be supplied with necessaries for their voyage round Cape Horn; and, with this view, he indicated the Falkland Islands as an eligible rendezvous for vessels in these high southern latitudes. His lordship also, when at the head of the admiralty, forwarded the scheme, and some preparations were made for putting it in execution; but as it met with opposition at home, and gave offence to the court of Madrid, it was laid aside till the year 1764, when it was revived by Lord Egmont. Commodore Byron being then sent out with proper necessaries, took possession of these islands in the name of his majesty, and represented them in a favourable light; but his successor, Captain Macbride, affirmed that the soil was utterly incapable of cultivation, and the climate intolerable. Be this as it may, however, the islands in question had also attracted the notice of the French; but as that nation had been greatly reduced by the late war, no project of the kind could yet be put in execution at the public expense. M. Bougainville, therefore, undertook, with the assistance of his friends, to form a settlement on the Falkland Islands at their own risk; and the scheme was put in execution in the beginning of the year 1764, and a settlement formed on the eastern part of the same island in which Commodore Byron had established an English colony on the western side. But the French adventurers soon became weary of their new colony; and M. Bougainville, having been reimbursed for his expenses, the French gave up every claim of discovery or right of possession; while the Spaniards, landing some troops in 1766, took possession of the fort built by the French, and changed the name of the harbour to Port Solidad. In 1769, Captain Hunt of the Tamar frigate happening to be on a cruise off the Falkland Islands, fell in with a Spanish schooner which had been at Port Solidad, and charged the commander to depart from that coast, which he declared to be the property of his Britannic majesty. The schooner, however, soon returned, bringing an officer from the governor of Buenos Ayres, who gave a similar warning to Captain Hunt; and the latter, not choosing to push matters to extremities, set sail for England, where he arrived in June 1770. On the departure of Captain Hunt, two frigates were left at the Falkland Islands; but one of these was lost a short time afterwards. On the 4th of June 1770, a Spanish frigate arrived at the English settlement named Port Egmont, with a number of guns and other warlike implements for carrying on a regular siege; and in three days four other frigates arrived laden in the same manner; so that the English

Reign of George III. commander, finding all resistance vain, was obliged to capitulate. The English were ordered to depart within a limited time, carrying with them what stores they could; and the Spanish commander declared himself answerable for whatever they might leave on the island.

So audacious an insult to the British flag seemed to render war inevitable, if suitable reparation should be refused. It was accordingly mentioned in the speech from the throne in November 1770, when an immediate demand of satisfaction for the injury was promised; and it was further intimated that the necessary preparations for war, which had been begun, should not be discontinued. The affairs of America were also noticed; and, where grounds of complaint still existed, an assurance of redress was given. But these promises, especially in regard to the Falkland Islands, were far from giving satisfaction; and a motion was now made in both houses for an inquiry into the conduct of the Spaniards, as well as for the production of all papers and letters relative thereto. But the demand was opposed by the ministry, upon the grounds that the interest of the public service precluded the idea of exposing letters or papers transmitted in confidence while the negotiation was depending, and that the king of Spain had disavowed the conduct of his officer, and promised satisfaction.

Some time before this, Mr Harris, the English minister at the court of Madrid, had dispatched a letter to Lord Weymouth, informing him that a ship had arrived from Buenos Ayres, with an account of the intended expedition against Port Egmont, the number of men to be employed, and the time fixed for its departure; but Prince Maserans, the Spanish ambassador, had declared his belief that the governor of Buenos Ayres had employed force at Port Egmont without any orders, and expressed a hope that, by disavowing the proceeding, he might prevent any misunderstanding betwixt the two kingdoms. To this Lord Weymouth replied by inquiring whether the prince had any orders to disavow the proceedings of the governor; and, on his answering in the negative, his lordship demanded a formal disavowal. After some time, it was stated, on the part of Spain, that the prince was authorized to disavow any particular orders given to M. Bucarelli, the governor of Buenos Ayres; that the island should be forthwith restored; and that it was expected the king of Britain would, on his part, disavow the conduct of Captain Hunt, whose menace had induced the governor to act as he did. But this proposition did not prove satisfactory. Mr Harris was ordered to quit the court of Madrid; and the correspondence between Prince Maserans and the court of England was discontinued. About this time Lord Weymouth resigned his office, and was succeeded by the Earl of Rochford; and the affair of the Falkland Islands ceased to be spoken of.

But, on the meeting of the parliament in January 1771, it was again brought before the house, when the declaration of the Spanish ambassador, and Rochford's acceptance, were announced. Prince Maserans then disavowed, in the name of his master, the violence used at Port Egmont, the restitution of which was agreed to upon an understanding that such restitution should be considered as ample satisfaction, but not as affecting the question concerning the prior sovereignty of the islands. This produced a new demand for copies of all papers, letters, and declarations, relating to the Falkland Islands; and though it was now apparently complied with, the opposition affirmed that it was still only in part, since, besides a chasm of nearly two months, of which there was no account whatever, all copies of the claims or representations made by the court of Spain since the first settlement of the islands were kept back, and a suspicion was thus excited that the

concealment of these papers might proceed from some misconduct during the periods in question, over which administration were willing to draw a veil. On the part of the government it was answered, that every paper which could be found in the several offices had been presented; that if there had been any correspondence between the two courts of which no notice was taken in them, it must have been verbal; and that, at any rate, there were papers sufficient to enable the house to determine the propriety or impropriety of their conduct throughout the whole transaction. But these excuses did not satisfy the opposition, and a motion was made to address his majesty for information as to whether any such interference had taken place, and of what nature it was, or in what manner it had been conducted. The motion, however, was lost by a great majority in both houses. Nevertheless this manner of deciding the question was far from allaying the ferment which prevailed. The transaction was considered as disgraceful to the British nation; nor were all the arguments which could be used by the ministerial party sufficient to shake the general opinion. The restitution of the island was thought to be an inadequate recompense for the affront that had been offered; and the objections to it were urged on a motion for an address of thanks on account of the communication of the Spanish declaration, which was not carried without considerable difficulty, and in fact produced a protest from nineteen peers. On the part of Spain, however, every article of the agreement was ostensibly fulfilled; Port Egmont was restored, and the British once more took possession of it, though it was in a short time afterwards evacuated.

In other respects great discontent prevailed throughout the kingdom. A fire which happened at Portsmouth in the year 1770 excited numberless jealousies, and was by some imputed to our enemies on the Continent. The affair of the Middlesex election was not forgotten; and notwithstanding many repulses, the city of London still ventured to send up new petitions to the throne. In one presented this year by Mr Beckford, the lord mayor, the petitioners lamented having incurred the royal displeasure, but renewed a request, frequently preferred before, for a dissolution of parliament. This, however, met with a very unfavourable answer. His majesty informed the lord mayor, that his sentiments on the subject continued unchanged; and that he should ill deserve the title of father of his people, were he to suffer himself to be prevailed on to make such a use of his prerogative as he could not but think inconsistent with the interest, and dangerous to the constitution, of the kingdom. Mr Beckford, far from being disheartened by this answer, demanded leave to address the king; and having obtained it, made a speech of considerable length, which he concluded by telling his majesty, that "whoever had already dared, or should hereafter endeavour, by false insinuations and suggestions, to alienate his majesty's affections from his loyal subjects in general, and the city of London in particular, was an enemy to his majesty's person and family, a violator of the public peace, and a betrayer of our happy constitution as it was established at the glorious revolution." This behaviour of Mr Beckford was censured by the court party as indecent, unprecedented, impudent, and little short of high treason; whilst, on the other hand, it raised him to the highest pinnacle of popular favour. But he did not long enjoy the applause of the people; for he died a short time afterwards, and his death was considered as an irreparable loss to the whole party. Several other petitions were presented on the subject of popular grievances; but the perpetual neglect with which they were treated at last brought that mode of application into disuse.

A new subject of contention, however, now presented

Reign of George III. of itself. The navy was in a bad condition, and the sailors everywhere avoided the service. Towards the end of August sixteen ships of the line were ready to be put to sea; but the legality of press warrants being questioned, the manning of them became a matter of great difficulty. The new lord mayor, Crosby, refused to back the warrants, which proved a very vexatious matter to the ministry; and they were further provoked by the unbounded licentiousness of the press. But, on the other hand, the mode of proceeding against some libellers had produced many complaints regarding the powers of the attorney-general. He had filed informations and carried on prosecutions *ex officio*, without going through the forms observed in all other cases of the kind; and this was described as inconsistent with the nature of a free government. Examples were cited of flagrant oppression and injustice occasioned by the exercise of this very power; the laws, it was said, had become changeable at the pleasure of a judge; and the liberty of the subject was taken from him whenever he became obnoxious to his superiors. Accordingly a motion was made in the House of Commons to bring in a bill for explaining and amending an act of the 4th and 5th of William and Mary, to prevent invidious informations, and for the more easy reversal of outlawries in the Court of King's Bench. But this motion was rejected by a great majority, the ministerial party urging that the power of the attorney-general was the same as it had ever been, and founded on the common law; that the abuse of power was no argument against the legal exercise of it; that it was dangerous to overthrow established customs; and that the actions of the attorney-general were cognizable by parliament, which control must for ever prevent a licentious exercise of his powers. But these arguments did not put an end to the disputes on this head. The courts of justice were at the same time held up in a very despicable light, on account of some late decisions which had been deemed contrary to law and usual practice. By these the judges had assumed a power of determining whether a paper was a libel or not, whilst the business of the jury was confined to the determination of the fact regarding its publication; and thus it was alleged that the judges had it in their power to punish a man who had been found guilty of publishing a paper, whether it was seditious or not. Lord Chatham, in a speech on the Middlesex election, took occasion to mention these abuses; and was answered by Lord Mansfield, who looked upon himself as particularly pointed at. The former, however, was so little convinced by the answer, that he drew from it an additional confirmation of his own arguments, and moved that a day should be appointed for taking into consideration the conduct of the judges; in which proposal he was ably seconded by the ex-chancellor. A committee was accordingly moved for on the 6th December 1770, to inquire into the matter; but after much debate the motion was rejected by a very large majority. The affair, however, did not yet seem to be terminated. Lord Mansfield gave notice next day, that on an early day he would communicate to the House of Lords a matter of the utmost importance; but when that day arrived he produced nothing except a paper containing the case of Woodfall the printer, as tried in the Court of King's Bench, that whoever pleased might read or take copies of it. This was looked upon as exceedingly frivolous, and greatly disappointed the expectations of the whole house. His lordship was asked whether he meant that the paper should be entered on the journals of the house; and he answered that he had no such intention, but only that it should be left in the hands of the clerk; on which the affair would probably have been altogether overlooked, had not the ex-chancellor, who all along strongly supported the motion, accused Lord Mansfield, from the very paper to which he appealed, of

Reign of George III. a practice repugnant to the law of England, proposed to him some queries relative to the power of juries, and challenged his antagonist to a debate either at that time or afterwards. But this method of proceeding was complained of as too precipitate, and an excuse was likewise made for not assigning a day for the debate at any future period, so that the matter soon sunk into oblivion. It was, however, loudly talked of without doors; and the judges, who had already sunk in the estimation of the people, now became much more obnoxious.

An accident which occurred soon afterwards contributed also to lessen in the eyes of the people the character, not only of the ministerial party, but that of both houses of parliament taken collectively; and indeed it must be owned that nothing could be more derogatory to the honour of the first assembly of the nation, or to that of the individuals composing it. On the 20th of December 1770 a motion was made by the Duke of Manchester, that an address be presented to his majesty, praying that he would be graciously pleased to give orders for quickening our preparations for defence in the West Indies and in the Mediterranean, and particularly for securing the posts of Gibraltar and Minorca. But whilst his grace was decanting on the negligence of the ministry in leaving posts of such importance in a defenceless state, he was suddenly interrupted by Lord Gower, who insisted on having the house immediately cleared of all except those who had a right to sit there. His lordship was answered by the Duke of Richmond, who complained of the interruption given to the Duke of Manchester as a proceeding both irregular and insidious. This produced a considerable degree of altercation; and the cry of "Clear the house" resounded from all quarters. Several members attempted to speak, but found it impossible; and, piqued at this shameful behaviour, eighteen or nineteen peers left the house in a body. The members of the House of Commons then present were not only commanded to depart, but some of the lords went personally to the bar, and insisted on their leaving the house immediately. The latter alleged in excuse, that they attended with a bill, and were there in the discharge of their duty; but this availed nothing; they were peremptorily ordered to withdraw till their message should be delivered, and at length turned out of doors amidst the greatest tumult and uproar. In the mean time the lords, who had just left their own house, repaired to the lower house, where they were listening to the debates, when the commoners who had been turned out of the Lords arrived, full of indignation, and loud in their complaints of the affront they had received. This was resented by turning out indiscriminately all the spectators; amongst whom were the eighteen peers just mentioned, who were thus excluded from both houses. This affair issued in a misunderstanding between the two houses, which continued during the remainder of the session. Sixteen lords joined in a protest, and censured in the warmest terms the treatment they had met with, as well as the unprecedented behaviour of administration, who had thus attempted to suppress the freedom of debate, and rendered the conduct of the house an object of contempt and ridicule to the whole world.

Soon after the discussion on the subject of the Falkland Islands, an extraordinary instance of corruption in the borough of New Shoreham, Sussex, was laid before parliament. The affair was brought by the returning officer, one Roberts, declaring a candidate duly elected who had only thirty-seven votes, whilst his opponent had eighty-seven suffrages; and when this man was brought to trial for so strange a proceeding, a scene of unparalleled villany was disclosed. A great number of the freemen of the borough had formed themselves into a society called the Christian

Reign of
George III.

Club, which, instead of sustaining the character indicated by its denomination, was rendered instrumental in furthering the purposes of venality. A select committee of the members had been appointed to sell the borough to the highest bidder. The committee-men never appeared at elections themselves, but issued orders to the rest, directing them as to how they were to vote; and after the election terminated, they shared the profits among themselves. All this was clearly proved; but the returning officer was nevertheless dismissed with a reprimand from the Speaker for having trespassed upon the forms which ought to have been observed by such a functionary. A more severe punishment, however, was reserved for the borough, particularly the wretches who had assumed the name of the Christian Club. A motion for inquiry having been carried unanimously, a bill was brought in to incapacitate eighty-one freemen of the borough, whose names were mentioned, from ever voting at parliamentary elections; and, for the more effectual prevention of bribery and corruption, the attorney-general was ordered to prosecute the committee belonging to the Christian Club. After some opposition the bill for incapacitation at length passed, and received the royal assent on the last day of the session.

The unbounded licentiousness of the press now attracted the notice of parliament, though the evil appeared incapable of being effectually checked. At this period neither rank nor character formed any security against calumny; and indeed it was difficult to say which side went farthest in the career of detraction and abuse. The ministry, however, provoked by a long course of opposition, made loud complaints against the freedom taken with their names; but it was retorted by the opposition, that the abuse from one quarter was as great as that from the other. Some members of the House of Commons complained that their speeches had been misrepresented in the papers, and endeavoured to put a stop to the practice of reporting them. It was at this time considered as contrary to the standing order of the house to print the speeches of the members of parliament; and a motion for calling two of the principal printers to account was carried by a considerable majority. The printers, however, did not attend the summons of the messenger; and a final order for their appearance was directed to be left at their houses, and declared to be sufficient notice when left there. The disobedience of the printers was undoubtedly occasioned by the favour which they hoped to obtain with the popular party; and indeed it was only after severe animadversion that the ministry were able to carry the motion against them. And this opposition was heightened by its being further moved that they should be taken into custody by the serjeant at arms, for contempt of the orders of the house; a proceeding which was objected to on account of the temper and disposition of the people towards the house, and the great impropriety of adding to their alarms by any unnecessary stretch of the executive power. But the majority urged the necessity of preserving the dignity of the house, and putting an end to those excessive freedoms which had been taken with its members. The serjeant at arms next complained, that not being able to find the printers at their houses, he had been treated with indignity by their servants; on which a royal proclamation was issued for apprehending the two obnoxious typographers, Wheble and Thomson, with a reward annexed. But in the mean time six other printers, who had rendered themselves equally obnoxious on a similar account, were ordered to attend the house, though the motion had not been carried without great opposition. Some of the delinquents were reprimanded at the bar, and one who did not attend was ordered to be taken into custody for contempt. Wheble being apprehended in consequence of the proclamation,

was carried before Alderman Wilkes, by whom he was discharged; Thomson was in like manner discharged; and the captors received certificates from the magistrates, in order to entitle them to the promised reward. Millar, one of the six who had refused to attend, was taken into custody at his own house by the messenger of the House of Commons; but he sent for a constable, and was carried along with the messenger before the lord mayor, and Aldermen Wilkes and Oliver, at the mansion-house. The lord mayor refused to deliver up the printer and messenger at the request of the serjeant at arms; and after some disputes the messenger was committed to prison, as he had been accused by Millar of assault and false imprisonment, and the serjeant had refused to find bail; but he was immediately released upon bail being given. The lord mayor was ordered to attend the house next day, when he pleaded that he had acted in no way inconsistent with the duties of his office, since by his oath he was bound to preserve the franchises of the city; and his conduct was further warranted by the terms of the city charters, as recognised by act of parliament. It was then moved that he should be allowed counsel; but this motion was overruled, upon the ground that no counsel could be permitted to plead against the privileges of the house. It was, however, carried that the lord mayor's clerk should attend with the book of minutes; and, notwithstanding all opposition, he was obliged to expunge from it the recognisance of Whittam the messenger. This was followed by a resolution that there should be no more proceedings at law in the case; upon which a vehement altercation ensued, and several of the minority at last left the house in the utmost rage. Though it was now one o'clock in the morning, the ministerial party refused to adjourn, and proceeded to the case of Mr Oliver, who, like the lord mayor, declined to express any regret for what he had done. Some proposed to censure his conduct, others were for expulsion; but when it was proposed to send him to the Tower, the utmost confusion took place, some members declaring that they would accompany him to the place of his confinement, whilst others left the house. Meanwhile ministry used their utmost endeavours to persuade him to make some kind of apology or concession for what he had done; but finding him immovable, they at last carried the motion for his imprisonment, and he was committed accordingly. After the confusion had been in some measure dispelled, the debates concerning the lord mayor were resumed, and many arguments were urged against proceeding further in the matter; but these being disregarded, the minority left the house; and his lordship refusing the favour offered him of being committed to the custody of the serjeant at arms, was sent to the Tower. Alderman Wilkes, on being ordered to attend, wrote a letter addressed to the Speaker, in which he observed, that no mention had been made of his being a member; and that if his seat in parliament, to which he had been duly elected, was to be granted, he would attend and justify his conduct. Administration, however, were too wise again to encounter this demagogue; but being at the same time under no little embarrassment how to get off, they at last had recourse to the miserable shift of ordering him to attend on the 8th of April 1771, while they adjourned the house to the 9th.

The only other transaction of moment during this session related to the East India Company. It was now proposed to raise two thousand men in England for the service of the Company, by whom the officers appointed by the king were to be paid. But it was considered as unconstitutional and dangerous to keep up an armed force in the kingdom which was not paid by government; and it was likewise urged that it would prove an obstruction to the recruiting service of our own army, on account of the

Reign of George III. superior advantages of enlisting in the Company's service. The session terminated on the 8th of May. In the speech from the throne it was observed, that the satisfaction obtained from his Catholic majesty for the injury done this kingdom, and the proofs of the pacific disposition which the courts of France and Spain had given, by laying aside their armaments, enabled his majesty to reduce the forces both by sea and land.

The many defeats which had been experienced by opposition during this and the preceding sessions now began to cool their ardour in the cause of patriotism. Many of them also had lost much of their popularity by taking part against the printers; and as every motion had been carried in favour of administration by nearly two to one, a general discouragement and languor ensued. The only gainers indeed by the late contentions were the city magistrates, and printers who had been punished by the House of Commons. On the rising of parliament, the lord mayor and aldermen were of course released from the Tower, and welcomed with every mark of congratulation. The city was illuminated; and the mob, as usual, took vengeance on the refractory by breaking their windows. A committee was even appointed to carry on a prosecution against the Speaker of the House of Commons; but as this did not seem likely to afford redress, they determined once more to have recourse to the throne. Accordingly, on the 10th of July 1771, another petition and remonstrance was presented, the subjects of which were the embankments on the Thames, the proceedings against the magistrates, and a request for a speedy dissolution of parliament. But this met with as unfavourable an answer as any of the preceding appeals to the sovereign.

In the speech from the throne, when the parliament assembled in January 1772, his majesty observed, that the performance of the king of Spain's engagements, and the behaviour of the other European powers, promised a continuance of peace, and that although the necessity of keeping up a respectable naval force was evident, yet no extraordinary aid for that purpose would be necessary; and he concluded with recommending a vigilant and active attention to the concerns of the country, with an assurance of the interposition of the crown to remedy abuses or supply defects. Little discussion took place on the address in answer to this speech; but an ample subject of altercation was soon furnished by a motion on the part of the government, the object of which was to recognise the necessity of raising twenty-five thousand seamen for the service of the current year. A proposition of this kind, coming immediately after the assurances of peace that had been given from the throne, seemed very like a contradiction. Accordingly it was argued that the peace establishment would thus be augmented till we were overburdened by it; that a large sum would be added to the national expenses; and that as the same augmentation might every year be made on similar pretences, the nation would in this way be obliged to submit to the hardships of war in a time of profound peace. If the assurances of peace from the throne were well founded, the force in the East Indies was already too great; if, on the contrary, a war was at hand, it would be too small, notwithstanding the proposed augmentation; and in the same way Jamaica was likely to suffer from this inferiority. But these remonstrances were by no means sufficient to put a stop to the measure; and the question in favour of the augmentation was carried without a division.

The subject which came next to be discussed was religion. This was originated by the tendency which had for some time prevailed to resist the subscription of the church standards. Meetings had been frequently held by discontented members, in order to consider of some mode

of relief; and in the beginning of February a number of them, with several professors of law and physic, joined in a petition to the House of Commons, expressing their dissatisfaction with subscription to any human forms, and praying for relief. In this petition they asserted that they held certain rights and privileges from God alone, without being subject to any other authority; that they accounted it a blessing to live under a government which maintained the sufficiency of the Scriptures to instruct in all things necessary to salvation; and that they had a right from nature, as well as from the principles of the reformed religion, to judge for themselves what was or was not contained in the Scriptures. They prayed therefore to be relieved from the burden of subscription, and to be restored to their undoubted right of interpreting Scripture for themselves, without being bound by any human explanation of it, or being required to acknowledge the truth of any formulary of religious faith and doctrine whatsoever, excepting the Holy Scripture itself. This petition was presented by Sir William Meredith, who, along with the other members favourable to the cause, enforced it by many arguments drawn from the principles of toleration, and maintained that nothing but hypocrisy and prevarication could arise from obliging men to subscribe what they did not believe; that the repeal of the laws for subscription would prevent the increase of dissenters, and incline many of them to return to the church; that the articles themselves were originally compiled in a hurry; that they contained doctrines highly controvertible; and that this restraint on the consciences of men constituted one of the greatest imaginable hardships. The majority of parliament, however, were found inimical to the petition, though some who then opposed it wished for time to consider it more deliberately, or to refer it to a committee of the clergy. At last, however, it was thrown out by a large majority.

The rejection of the subscription bill was followed by that of a bill for guarding the possessions of his majesty's subjects against dormant claims of the church. After this the attention of parliament was called to one of the utmost importance, which had been introduced by a message from the king. This was the famous royal marriage bill, occasioned by the marriage of the Duke of Cumberland with Mrs Horton, a widow lady, daughter of Lord Irnham, and sister to Colonel Luttrell, and that of the Duke of Gloucester with the countess-dowager of Waldegrave. By the message it was recommended to both houses to take it into their consideration, whether it might not be expedient to supply the defects of the laws then in being, and by some new regulations more effectually to prevent the descendants of his late majesty,—excepting the issue of the princesses who had married, or might hereafter marry, into foreign families,—from marrying without the consent of his majesty, his heirs and successors. In consequence of this a bill was brought in, declaring all such marriages, without the consent above mentioned, to be null and void. The descendants of his majesty, however, if above the age of twenty-five years, might marry without the royal consent, provided they gave intimation twelve months beforehand to the privy council, and no opposition to the match was made by parliament during that interval. But this bill encountered the most violent and powerful opposition. The principal arguments against it were, that the immediate tendency of the measure was to create as many prerogatives in the crown as there were matters of importance in the state, and to extend them in a manner as exceptionable as had ever been done in the most despotic period; that the enacting part of the bill had an inconvenient and impolitic latitude, in extending to all the descendants of George II.; that the time of nonage for the royal family

Reign of George III.

Reign of
George III.

appeared to be improperly extended beyond the limit of twenty-one years; that the deferring their marriage to the age of twenty-six might also be attended with bad consequences, by driving them into a disorderly course of life; that the power given by this bill to a prince to marry after the age of twenty-six was totally defeated by the proviso which declared the consent of parliament to be ultimately necessary; that the right of conferring a discretionary power of prohibiting all marriages, was beyond the reach of any legislature whatsoever, being contrary to the inherent rights of human nature, which, as they are not derived from, or held under, the sanction of any civil laws, cannot in any case be taken away by them; that this bill had a natural tendency to produce a disputed title to the crown; and that it provided no security against the improper marriages of princesses into foreign families, and those of their issue, which might as materially affect the interest of this nation as the marriages of princes residing in the dominions of Great Britain. To these arguments it was answered, that the inconveniences so much talked of were merely imaginary; that if the king should make any improper use of his authority, parliament had it in their power either to prevent the consequences, or to punish the minister who advised it; that the crown was dishonoured by improper connections; that many of the greatest national calamities had proceeded from improper alliances between the royal family and subjects; and that if experience showed that any material grievances ensued from this act, it could as easily be repealed hereafter as thrown out now, and on much better grounds. The result was, that with great rapidity, and by considerable majorities, it passed through both houses.

Though the decision concerning the subscription of the thirty-nine articles did not promise much success to any proposed innovations in matters of religion, yet the case of dissenting ministers was introduced soon after the discussion of the royal marriage act; and a petition was presented by a great body of dissenters, praying to be relieved from the hardship of subscribing to the articles of a church to which they did not belong. This, however, was most violently opposed, though with very little success, in the House of Commons, where it was carried by a very great majority. In this branch of the legislature it was maintained that nothing can advance the true interest of religion so much as toleration; and that if articles of subscription are necessary, it must only be for men destitute of principle, who, in compliance with ambition or avarice, would as readily subscribe one set of articles as another. In the House of Lords, however, the bill was rejected by a majority of seventy. Here the doctrine of universal toleration was vehemently scouted, and much was said of the danger to which the Church of England would be exposed by departing from the laws which guarded its privileges. The dissenters, it was alleged, had great cause to be satisfied with the favour they enjoyed by connivance; and the laws were only kept on record as a necessary curb, lest, in the degeneracy of a declining kingdom, religion should require protection against heresy and blasphemy.

The only other business of this session was an attempt at inquiry into the affairs of the East India Company, which were then in a very critical situation. But the subject did not come under consideration till next session, which commenced in November 1772; the situation of the affairs of the Company being alleged as a reason why parliament had been called together sooner than usual. The greater part of the present session was accordingly occupied with the concerns of the Company.

It had been projected, as long ago as the year 1667, to bring them under the inspection of government; but the design did not succeed at that time, nor would it probably

have been entertained now, had not the affairs of the Company been embarrassed by the misconduct of their servants. During the preceding session a bill had been brought in for restraining the governor and council from all kinds of trade, as well as for enlarging the power of the Company over its servants; but the bill was thrown out on the second reading, and indeed had probably been introduced merely to pave the way for what followed. The debates on the subject, however, produced a general belief that the affairs of the East India Company were, owing to the behaviour of its servants, in a very bad condition; that at any rate it was insufficient for the government of such extensive possessions; and that, in consequence, there was an evident necessity for giving up the management of it to the Crown. A motion was accordingly made for a select committee to inquire into the affairs of the Company; and although many reasons were urged against the proposition, it was carried without a division, and the members were chosen by ballot. But during the recess the affairs of the Company continued to retrograde, and the treasury at home was quite exhausted; whilst bills to a vast amount drawn on Bengal were nearly due, and these, together with the Company's debt to the Bank and other public bodies, and the sum to be paid to government, reduced them almost to the verge of bankruptcy. They were therefore reduced to the necessity of asking a loan from administration; but their application was received with great indifference, and the minister desired them to apply to parliament. Meanwhile the reports of the select committee were published, and gave the public no very favourable opinion of the behaviour of the Company's servants.

On the meeting of parliament, the minister moved for a secret committee, to consist of thirteen persons, and the members of which were to be chosen by ballot, in order that no objection might apply to them which did not militate equally against the whole house. This motion encountered some opposition; but, ultimately, the committee of secrecy was carried, as the other had been, without a division; and the members, though chosen by ballot, were almost all of them devoted to administration. The select committee was likewise revived, that these bodies might act as checks upon each other, and that between them the nation might have the requisite information respecting the whole matter.

In a short time after the appointment of the secret committee, a report was given in, stating that the Company were in great distress for want of money; and that a bill ought to be brought in for restraining them from sending out supervisors to India, a scheme which they at this time meditated. The minister and his adherents enlarged greatly on the utility of this bill, which they described as not only highly expedient, but absolutely necessary, in order to prevent the Company from engaging in an expensive commission, at a time when their affairs were so much embarrassed that they had no resource but to apply to government for a loan. But notwithstanding all the arguments used by administration in favour of the bill, the Company were so far from thinking it for their advantage, that they used every endeavour to prevent its passing into a law. They petitioned, and some of their servants were examined in the House of Commons, in order to show the necessity of sending out supervisors, qualified to bring their affairs into some degree of order, and at the same time capable of curbing the excesses of which the Company's servants had too frequently been guilty. In spite of all opposition, however, the bill was carried by a large majority; and in the House of Lords it met with similar success, although the minority thought proper to enter a protest.

The select committee now gave in their second report, containing a statement of the debt, credit, and effects of

Reign of
George III.

Reign of George III. the Company in England; beginning with an account of the cash in the Company's treasury on the 1st of December 1772, and containing a statement of all the debts and claims against them in every part of the world. Thus it appeared that the cash, credit, and effects of the Company, amounted to L.6,397,299. 10s. 6d., and their debts to L.2,032,306, which being deducted from the above account of their effects, left a balance in favour of the Company of L.4,364,993. 10s. 6d., without any valuation of their fortifications and buildings abroad. The statement, however, was complained of as being unfair and partial; but the members protested their innocence, and administration insisted that, until proof to the contrary was brought, the house was bound to adhere to it as just. The business was revived after the holidays by an application from the Company to government for a loan of L.1,500,000, for four years, at four per cent. interest, with liberty of repaying the same according to the ability of the Company, in instalments of not less than L.300,000; and that they should not make a dividend of more than six per cent. until the loan was reduced to L.750,000, after which they might raise their dividend to eight per cent.; and when the whole loan was discharged, the surplus of the net profits arising in England, above the said dividend, was to be appropriated to the payment of the Company's bonded debt, until it had been reduced to L.1,500,000, in which case the surplus profits were to be equally divided between the public and the Company. This request it was judged expedient to grant, and it was accordingly resolved that the affairs of the East India Company are in such a state as to require the assistance of parliament; that a loan is necessary to reinstate the Company's affairs; that the supply required be granted; and that care be taken that the Company be prevented from experiencing the like exigencies for the future. These restrictions were judged proper by administration for the security of the public; but the Company replied, that they were contrary to the proposals which had been made, and void of foundation, as being built on the erroneous reports of the secret committee. Some time was also demanded for consideration; but that being refused, the question was put and carried as ministry desired, by a considerable majority.

The next step was to deprive the Company of their territorial right to the countries which they possessed in the East Indies. This had been allowed them in the most explicit manner, as appears by some of the papers which passed between the French and English ministers during the negotiations that issued in the treaty of Paris; but Lord North informed the house that it was the opinion of several great lawyers, that such territorial possessions as the subjects of any state shall acquire by conquest are virtually the property of that state, and not of those individuals who acquire them. He was of opinion, however, that it would be more beneficial for the public and the East India Company, to let the territorial acquisitions remain in the possession of the Company for a limited time; and at the same time it was moved, that no participation of profits should take place betwixt the public and the Company until after the repayment of L.1,400,000 advanced to the Company, and the reduction of the Company's bonded debt to L.1,500,000; that, after the payment of the loan advanced to the Company, and the reduction of their bonded debts to the sums specified, three fourths of the net surplus profits of the Company at home, above the sum of eight per cent. upon their capital stock, should be paid into the exchequer for the use of the public, and the remaining fourth be set apart either for reducing the Company's bonded debt, or forming a fund for discharging any contingent expenses to which the Company might be exposed.

Reign of George III. These proceedings proved exceedingly disagreeable to the Company, who now presented a petition complaining of the injustice of demanding any further terms on account of a loan, after that loan had been discharged. But no regard was paid to this petition, and the motions were carried in favour of administration. To make some kind of compensation, however, it was agreed, that as the Company had a stock of teas amounting to about seventeen millions of pounds in their warehouses, they should be allowed to export as much of it as they thought proper free of duty, and to employ the money thence arising in the advancement of their own affairs.

This concession in favour of the East India Company proved in the event the loss of the American colonies; nor indeed could these arbitrary proceedings with so considerable a body tend to impress the mind of the nation with ideas favourable to the views of administration. In other respects the minister abated nothing of the disposition he had from first to last evinced with regard to the Company. On the 3d of May 1773 certain resolutions were laid down by him as the foundation of a bill to establish certain regulations for the better management of the East India Company, as well in India as in Europe. These were, that the court of directors should in future be elected for four years; that no person should vote at the election of the directors who had not possessed his or her stock twelve months; that the stock qualification for the future should be L.1000 instead of L.500; that the mayor's court of Calcutta should henceforth be confined to small mercantile causes; that, instead of this court, a new one should be established, consisting of a chief justice and three puisne judges, appointed by the crown; and that a superiority should be given to the presidency of Bengal over the other presidencies in India. Each of these resolutions was carried by a great majority. By the friends of the Company, however, the bill was supposed to have a tendency to effect a total alteration of its constitution in England, as well as in the administration of all its presidencies in Asia, and to subject their affairs, both at home and abroad, to the immediate power of the crown. By cutting off the L.500 stockholders, the proprietary would become more manageable by the crown; nor was there any security that the directors would be faithful to the interests of the Company when they were no longer responsible to them for their actions. This class of proprietors presented a petition, which gave rise to a motion, bearing that the petitioners had not been guilty of any delinquency in the exercise of their chartered rights according to the several acts of parliament made in their behalf. But the motion was rejected, and the regulating bill passed both houses by large majorities.

During this time the select and secret committees were pursuing their inquiries. The affairs of the Company were investigated from the year 1756, and a report was at length presented by General Burgoyne, containing many charges of cruelty and rapacity, against several persons concerned in the management of the affairs of the Company, particularly with regard to the deposition of Surajah Dowlah in 1756, which was described as the cause of all the evils which had since happened. The report dwelt much on the treachery employed in bringing about that revolution, particularly the fictitious treaty with Omichund; and exposed the conduct of Lord Clive, who had caused Admiral Watson's name to be affixed to the treaty, after the admiral himself had refused to sign it. It concluded with moving for the restitution of all the money received in presents or otherwise in India whilst the receivers acted in public capacities; and recommended the adoption of resolutions, bearing in substance that all acquisitions made under the influence of a military force, or by treaty with

Reign of
George III.

foreign powers, belong of right to the state; that to appropriate acquisitions obtained by such means is illegal; and that great sums of money had been obtained by such means from the sovereign princes in India. The belief that many of the Company's servants had acted in an infamous manner, was at this time so general and so strong, that these resolutions were carried almost unanimously. Lord Clive defended himself by general protestations of innocence, which, however, gained but little credit; and when he entered into a particular refutation of the charges against him, he did not succeed in making many converts to his reasoning. But his friends were not of opinion that the charges were of a very atrocious nature, and wished to excuse him on the ground of policy and necessity. The treaty with Omichund was justified on the plea of necessity. Some, indeed, observed that as Omichund had the character of being the most accomplished villain in Asia, the Englishman merely wished to have a trial of skill with the Asiatic. This sarcasm, however, was a mere piece of wit, without any solid foundation; for the crime, if there was any in the transaction, lay in dethroning a sovereign prince by means of traitors, and not in cheating the traitors out of their reward. And, in fact, if treachery be once admitted into transactions, whether civil or political, it is in vain to pretend any subjection to the rules of justice; for those who call in the aid of such an auxiliary are already beyond its jurisdiction. General Burgoyne, however, moved that Lord Clive had, in consequence of the powers with which he was vested in India, received at various times presents to the amount of L.234,000 sterling, to the dishonour and detriment of the state. But this being rejected, after a violent debate, it was moved that Lord Clive, in receiving such a sum, had abused the power with which he was intrusted, to the evil example of the servants of the public. This motion, however, was also rejected, and it was ultimately voted that Lord Clive, when he received the sum above mentioned, at the same time rendered great and meritorious services to his country. Thus the matter was concluded, and thus the affairs of the Company were delivered into the hands of administration.

The affairs of the East India Company, which had engrossed so much time and attention, now gave place to those of America, which by this time had assumed a very lowering aspect. The discontent occasioned by the taxes imposed on that country has already been noticed. The stamp act had excited among them a spirit of industry and economy, as well as a desire of providing themselves with manufactures of their own, which had not been foreseen. At the time, as well as afterwards, this was imputed to wilfulness, or to the discontent of a few, which would afterwards subside, or be suppressed by the voice of the majority, when things would revert to their former channels. But the trifling tax on tea, which had not been repealed, and the permission given to the Company to export whatever quantity they pleased, now threw matters into a ferment not to be quelled by any means whatever. Of the various proceedings in America, the tumults at Boston and elsewhere, the accidental circumstances which added fuel to the flame, and the war which ensued and ultimately terminated in the recognition of American independence, an account will be given under the article UNITED STATES. It is only necessary here to give an account of the manner in which the legislature and people of Great Britain were affected by these events.

Ever since the conclusion of peace in 1763, the disposition shown by government to augment the revenue had produced in the popular party of Great Britain a spirit similar to that manifested by the Americans, though in an inferior degree; and hence the patriots of Britain affected to consider the Americans as oppressed by government, and

suffering in the same cause with themselves. The wanton destruction of the tea at Boston and other places in America, however, considerably diminished the number of their friends, and rendered many of those who still adhered to them much less sanguine in their cause. The matter was announced to parliament by a special message from the throne. Lord North and the other ministers described the conduct of the colonists, particularly in the town of Boston, as most atrocious, and concluded that government was now perfectly justified in resorting to any measures they might think proper to repress the turbulent spirit which had been manifested, and inflict such punishment as the enormity of the offence seemed to deserve. The opposition did not pretend to exculpate, though it still attempted to excuse, the conduct of the colonists, by ascribing all the disturbances in that country to the arbitrary and absurd measures pursued and obstinately adhered to at home. But the ministry evaded this charge by drawing the attention of the house to the more important consideration, whether the Americans were now to be dependent on, or independent of, Great Britain. The Boston port bill was then brought in, and carried, but not without considerable opposition, both within and without doors. Mr Bolla, agent for the council of Massachusetts Bay, founding on an act of Queen Elizabeth, for securing the liberty of the colonies, drew up a petition, and caused it to be presented before the bill had actually made its appearance: but so little regard was paid to it, that, during the time it lay on the table, the bill was brought in by Lord North. After the second reading, the same gentleman presented another petition, desiring to be heard in behalf of the town of Boston, and for the council of Massachusetts Bay; but this was refused, because, although Mr Bolla was agent for the colony, he was not so for the corporation of Boston, and still less for the council of Massachusetts Bay, as the body which had appointed him was now no longer in existence. This appeared very inconsistent to many of the members, and produced a new petition from the lord mayor, in the name of such natives and inhabitants of North America as at that time resided in London, in which the petitioners insisted that the bill was illegal, unprecedented, unjust; and that, after such a precedent as it went to establish, no man or body of men in America could have a moment's security. But as little regard was paid to this as to the former petitions, and the bill passed both houses without a division. That this obnoxious bill might not be sent to America without some mitigation, however, the minority, who had not chosen to divide formally on the first measure proposed by government for reducing the refractory colonists, proposed the repeal of the duty on tea laid on in 1767; but this was also rejected, probably from an erroneous impression that the opposition of the Americans was that of a mere tumultuous mob, and that by showing proper spirit the ministry would at last come off victorious.

The extreme pertinacity shown by ministers, in this instance, undoubtedly proved highly prejudicial to their cause, both by exasperating the Americans, and by rousing the indignation of the minority in parliament, and rendering opposition more violent and determined. This appeared in every subsequent proceeding relative to the colonies. Even the bill for regulating the government of Massachusetts Bay did not pass without a protest; and a similar result ensued on the passing of the act for the impartial administration of justice. The opposition made to the Quebec bill was even more violent, inasmuch that, ere it could be carried, the ministers were obliged to lower the high and aspiring tone to which they had accustomed themselves in talking of American affairs. The minority contended, that without any necessity pleaded,

Rei of or even suggested, an arbitrary influence was extended
Geor III. by act of parliament to that province; they likewise argued in favour of the method of trial by jury; and they thought that the establishment of the Roman Catholic religion in that country gave it a preference over the Protestant, which was henceforth to be exercised only by toleration.

At the conclusion of the session his majesty declared himself satisfied with what had been done, and expressed his hopes that good effects would result from the new regulations. The reception which they met with in America will be related in the proper place; in Britain the people seemed to await the event with indifference. The parliament in the mean time was dissolved by proclamation, and a very short time allowed for the election of new members; so that if opposition at that time possessed any strength, they were not allowed sufficient time to exert it.

The new parliament met on the 30th of November 1774, when his majesty informed the two houses that a most daring spirit of resistance still prevailed in America, notwithstanding the means which had been taken to prevent the mischiefs thence arising; and assured them that they might depend on his firm resolution to withstand every attempt to weaken or impair the supreme authority of the legislature over all the dominions of the crown. In answer to the speech from the throne, the minority demanded a communication of all letters, orders, and instructions, relating to American affairs; but this was overruled, and the address being carried as a matter of form, the consideration of American affairs was delayed until after the holidays.

In the beginning of 1775 the minority received a considerable accession of strength by the return of Lord Chatham, who, after a long absence, again made his appearance in parliament. He now testified in the warmest terms his disapprobation of the measures which had been pursued regarding America; he moved for addressing the king to recall the troops from Boston; he predicted, that if ministers persisted in the course they had for some time pursued, they would make the crown not worth the king's wearing; and he declared that the kingdom would be undone if measures of undue coercion were employed. But all the eloquence of this great man proved ineffectual; administration were determined upon reducing the Americans to subjection, and his motion was rejected by a very large majority. Lord North now presented the papers which had been called for by the minority; but lest the publication of particular names should prove detrimental to individuals, only such parts as administration thought proper for public inspection were laid before the house. This was complained of, but to no purpose; and the papers, in their mutilated state, were laid before a committee of the whole house.

In the mean time, petitions against the adoption of coercive measures against America had been received from most of the trading companies in the kingdom; and as these, though highly displeasing to administration, could not be absolutely thrown overboard, a committee was appointed to consider them; but this was not to take place until American affairs were also considered. The reason given for this method of proceeding was, that the consideration of commercial matters ought not to interfere with those of a political kind, each of them being sufficiently embarrassing without the other. The delay in hearing these petitions, however, was supposed to be in effect an absolute rejection of them; and so indeed it proved, the committee to which they were consigned being humorously styled the "Committee of Oblivion." The merchants of London, however, being determined not to give up the point until they had exerted themselves to the utmost,

drew up a paper, in which they denied the distinction established by ministry, and affirmed that the connection between Great Britain and America was chiefly of a commercial nature, and that the manifold regulations adopted for the mutual prosperity of the colonies and of the mother country formed the great political chain which united them to one another. This remonstrance was vigorously seconded by the opposition; but the administration had already determined on the line of conduct they were to pursue, and therefore wished to hear as little as possible on the subject. War was now the word; and although no weightier reason could be given for disregarding what the merchants had to say, this was the motive which impelled ministers to refuse them a hearing, lest these should make it appear that the nation was unwisely precipitated into such a measure.

But though there is no reason to doubt that administration were now fully determined upon a war, and therefore wished to be troubled with as few objections as possible, they were by no means deficient in arguments in justification of their own conduct. They alleged that the petitions so strongly pressed on the attention of the house were principally the work of a factious party; that the advantages resulting from the trade with America arose from the dependent condition of the colonies, which now aimed at shaking off entirely the supremacy which the mother country had hitherto exercised over them without the smallest complaint; that the advantage of the merchants themselves was consulted in maintaining that supremacy; that they would be the first to feel the pernicious consequences of its being lost; that war, though no doubt a great evil, was sometimes necessary to prevent a greater; that were the government to yield in the present contest, no advocate of America could pretend to say what would be the last of its demands; that the Americans were not to be reclaimed by concessions; that the honour and character of the nation were at stake; and that Britain had often taken up arms for matters of less consequence, and should not now hesitate where honour and interest both called for the most vigorous and effective exertions.

These arguments prevailed, and the motion in favour of the merchants' petitions was rejected by a prodigious majority. This point, however, had no sooner been disposed of, than a violent debate arose concerning the petition of congress to the king, which had been referred to parliament. It was argued by administration, that no petition could be received from the continental congress, which was not a legal body; that it would be admitting their legality to receive a petition from them; and that the general assemblies and their agents were the only lawful representatives of the colonies, and could alone be recognised as such. Opposition disputed these positions, but to no purpose; for, after an ineffectual struggle, the petition was rejected by a very large majority.

In the mean time a conciliatory plan, prepared by the Earl of Chatham, was presented on the first day of February 1775. The declared object and intent of this bill was to settle the troubles in America, and at the same time to assert the supreme legislative authority and superintending power of Great Britain over her colonies. No taxes were to be levied in America, but with the free consent of their assemblies. The right of the crown to station and maintain a military force established by law in any part of its dominions was pointedly asserted; but it was also declared, that it could not be legally employed to enforce implicit and unlawful submission. A congress was also to be held, in order to recognise the supreme sovereignty of Great Britain over the colonies, and to settle an annual revenue upon the crown, disposable by parliament, and applicable to the exigencies of the nation.

Reign of
George III.

And on these conditions being complied with, the acts complained of by congress were to be suspended, with every other measure pointed out as a grievance, and the constitution of the different governments to remain as settled by their charters. This bill, however, was deemed totally inadmissible, on account of the various concessions it enacted, and particularly from its empowering the colonies to assemble in congress; a measure which was at that time the most offensive, and supposed to be the most injurious to the interests of Britain. Lord Chatham showed no deficiency of argument in support of his favourite scheme; but his reasoning, though enforced with all the powers of his eloquence, proved unsuccessful, and the proposal was ultimately rejected.

A petition was next presented to the House of Commons by the proprietors of estates in the West India islands, representing their alarm at the association of the Americans, and the intended stoppage of trade with the British islands, the situation of which, it was alleged, would be very calamitous, if the acts in question were not immediately repealed. To the administration, however, all petitions now appeared to be the contrivance of faction; but as it was deemed necessary to inform the nation as to the ultimate views of the government respecting America, Lord North, in a long speech, enumerated the most remarkable circumstances relating to the dispute with that country. He affirmed that the ferment then prevailing in America proceeded from the unwarrantable arts and practices used to inflame the people against the ruling powers in Britain; that, notwithstanding all their complaints, the public charges borne by individuals in America were not more than as one to fifty, compared with what was paid by individuals in England; that nothing but a settled determination to quarrel with the parent state could induce the Americans to persist in their disobedience to the lawful injunctions laid upon them, and which were neither injudicious nor oppressive; and that a spirit of resistance, not discontent at oppression, animated America. For these reasons he proposed to the house to send a greater force to America; and to pass a temporary act, suspending all the foreign trade of the different colonies of New England, and particularly the Newfoundland fishery, until they consented to acknowledge the supreme authority of the British legislature. New England was singled out upon this occasion, as being accounted the most guilty. The others, it was hoped, would yield with less compulsion; but the question now was, whether this country should at once abandon all claims on the colonies, and instantly give up the advantages arising from our sovereignty, and the commerce dependent on it, or whether it should resort to the measures which had become indispensably necessary to insure both.

An address was now carried, which, by the showing of opposition, amounted to a declaration of war. The consequences, therefore, were pointed out with the utmost freedom, and some even denied the charge of rebellion fixed on the province of Massachusetts Bay. The people there, they said, had done nothing but what the constitution allowed; they had resisted arbitrary measures; and the examples so frequently set them at home were sufficient to justify their conduct. The address, however, was carried as usual by a large majority. But so important was the subject of it deemed by the minority, that a motion was made for recommitting it, on account of the consequences that might probably result from the prosecution of the measures recommended. A very long and violent debate ensued, in the course of which the administration contended as usual for the necessity of enforcing obedience by the sword. The Americans, they said, had become incorrigible through forbearance; lenity was a subject of

derision among them, and was imputed to imbecility and fear; they imagined themselves able to abolish the sovereignty of Britain in that country, and were now resolved to do it. It was therefore incumbent on every native of Britain in such a case to stand forth and vindicate the interest and glory of his country; and it was the duty of parliament and ministry to call forth the whole spirit of the nation to a contest in which every thing dear to them, both in their public and private capacities, was so deeply concerned. The views and principles of ministers were attacked in the most violent manner. They were said to be reviving the old exploded doctrines of hereditary right and passive obedience, and requiring the Americans to submit unconditionally to the will of Great Britain, for no other reason but because she was the parent state. But if no better reason could be produced, they could not be justly blamed for their disobedience. The ties between Great Britain and her colonies, however, were of a far more noble as well as more binding nature than even origin and consanguinity. These ties were the constitution transmitted from Britain, and the brotherly assistance hitherto afforded them by Englishmen, and which ought to render the name dear to them. While these ties remained unviolated, there was no room to complain of their behaviour; but they would never submit to despotic authority in Englishmen more than in any others. Such unwarrantable principles rendered it no longer a question whether the measures of administration should be considered, but whether the ministers themselves ought not to be deprived of the power which they exercised so unconstitutionally. The question was not now between Great Britain and America, but simply whether we should give up our colonies or our ministers. This kind of language excited the indignation of the ministerial party, who in return charged minority in plain terms with the guilt of all that had happened. There had gone forth, it was said, a factious and republican spirit, by which every person who wrote or spoke on the American cause was actuated, and which had not only induced the Americans to commence a rebellion against the parent state, but had filled the house with incendiaries. The final issue of the dispute was, that the recommitment of the address was lost by a majority of more than two to one. The debates were the most violent that had ever been known in the British parliament; and so important was the subject reckoned, that not only the people of this country, but even the foreign ministers in London, watched the motions of administration with the utmost anxiety.

But all these victories were not sufficient to prevent new enemies from starting up. Petitions had been preparing by the London merchants trading to America, and by those concerned in the West India trade, in order to be presented to the House of Lords. This task was undertaken by the Marquis of Rockingham; but he was prevented from executing it by a previous motion in favour of the address. A long and violent debate, however, ensued concerning the necessity and propriety of receiving them; but it was at length resolved that the petition could not be received consistently with the interest of the kingdom.

In the mean time matters became daily worse in New England; and it was soon perceived, either that the friends of government in that colony did not exert themselves, or that they were far from being so numerous as had been imagined. In order to render their coercive plan the more effectual, therefore, it was judged necessary to extend it so that every individual of the colony might become sensible of the punishment. This, it was supposed, would be done by a bill for restraining the four provinces of New England from commerce with Great Britain, Ireland, and

Reign of
George III.

Reign of George III. of the British West India islands, and prohibiting them from carrying on the fishery at Newfoundland. The reasons alleged for this proceeding were in substance the same with those for the others; and indeed both parties had now so much exhausted their arguments, that very little new matter remained for either. Every step taken by ministry, and every proposal made by them, however, produced a violent debate; and though they constantly gained the victory, it was not without the mortification of hearing their principles and conduct reprobated in the most opprobrious manner. In the present instance the bill was carried by a very large majority; but a petition against it was quickly presented by the London merchants concerned in the American trade, setting forth the danger which would accrue to the fisheries of Great Britain from such a prohibition. From the evidence produced in support of this petition, it appeared that, ten years before, the American fisheries had been in such a flourishing state, that the four provinces of New England alone employed nearly forty-six thousand tons of shipping and six thousand seamen; and that the produce of the fisheries in the foreign markets had amounted, in the year 1764, to upwards of £320,000. Since that time, however, they had greatly increased; and what rendered them particularly valuable was, that all the materials used in them, excepting only the timber for building the vessels, and the salt for curing the fish, were purchased in Britain, and the net proceeds of the trade were also remitted thither. Some other considerations were likewise urged as reasons against this bill, particularly the commercial concerns of New England with the city of London, to which alone the colony stood indebted in nearly a million sterling, and the bad consequences of it to the people of Nantucket, who, though inhabiting a barren island off the coast of New England, about fifteen miles in length and three in breadth, containing six thousand inhabitants, kept one hundred and thirty vessels constantly employed in the whale fishery, which they carried on in the north seas, to the coasts of Africa and Brazil, and even as far as the Falkland Islands. The case of Nantucket, in fact, was so strong that the administration were obliged to relax a little, and, of their own accord, afforded this industrious people the relief which they had such just reason to expect. The bill was debated with great animosity in the House of Peers, and produced a remarkable protest, in which the measures of government were spoken of with great severity.

The final resolution to reduce the colonies by force being now taken, it became necessary to make proper preparations for the purpose; and in this the conduct of administration was little less censured than in other respects. As the opinion that the Americans were naturally timid, and incapable of becoming soldiers, prevailed greatly at this time, a force of a thousand men was judged sufficient to reduce the province of New England to obedience. The project of ministers was vehemently opposed by the minority. They insisted that the force was totally inadequate, and only calculated to produce expense to no purpose. The first impression, they very justly observed, ought, if possible, to be decisive; and in order to render it so, it was necessary to send such a fleet and army as might insure the confidence of the public, and be certainly capable of surmounting all obstacles. Many of the friends of administration were of the same sentiments; and the only reason assigned for acting otherwise was founded on a hope that the Americans would, upon more mature consideration, desist from their opposition. That they might the more readily be induced to this submission, Lord North's conciliatory proposition was formed, by which it was enacted, that when the governor, council, and assembly of any of the colonies, should propose to make a provision for the common defence, and when such provision should be approved of by the king in parliament, the levying or imposing of taxes on that colony should then be forborne; those duties excepted which it might be expedient to impose for the regulation of commerce; and the net produce of which should be carried to the account of the colony where it had been raised. But this proposal, though highly extolled by the friends of administration, was no less reprobated by the minority than the others had been. Nevertheless, after a lengthened debate, the question was carried in favour of administration by a majority of more than three to one.

A similar fate attended a petition to the throne from the island of Jamaica. Instead of relaxing any thing of their severity, the ministry now included the southern colonies in the restrictions imposed on New England. Still, however, the petitioners were indefatigable in their endeavours.

Reign of
George III.

vours to be heard. The West India merchants and planters seconded their last petition by entering into a lengthened detail of circumstances relating to the British islands in that part of the world. This affair was conducted by Mr Glover, a gentleman celebrated for his literary talents and commercial knowledge. From his investigations it appeared that, exclusive of the intrinsic worth of the islands themselves, their stock in trade and other property amounted to no less than sixty millions; that the exportation to Britain had of late been near two hundred thousand hogsheads and puncheons of sugar and rum, amounting to no less than four millions in value; and that the direct revenue arising from this source was seven hundred thousand pounds, besides that which accrued from the collateral branches depending upon it. These arguments, however, were urged in vain. Conciliatory proposals were made by Mr Burke and Mr Hartley, but they were rejected by great majorities, and instead of serving the cause they were meant to promote, had the very opposite effect. A dread was entertained of the consequences which might ensue from the republican opinions now so prevalent in the colonies; and all partiality towards them was looked upon in so criminal a light, that their opponents became deaf, on many occasions, to the voice of reason and humanity when urged in their behalf. On the other hand, the favourers of America, urged on by a furious zeal, if not resentment, against those whom they looked upon as the promoters of arbitrary measures, erred equally in their opposition to ministry. And this violence of party spirit appeared not only among the people at large, but broke forth with the utmost fury in parliament, where the debates often resembled the railings of Billingsgate more than the deliberations of the representative assembly of a great and powerful nation.

In this temper of mind the state of affairs was scarcely ever truly represented by either party. Government continued to enact new laws, now in vain, against the Americans; whilst their antagonists opposed them in a manner so little different from that which has been already related, that any further account of the debates would be equally tedious and unnecessary. Other petitions were also presented, and treated with neglect. The union of the colonists, and their preparations for war, were described by the ministerial party as the mere commotions of a headstrong mob, but represented by the opposition as an association of an injured and virtuous people, who were about to found a mighty empire in the west, whilst Britain was doomed to sink into utter disgrace and contempt by their secession. In the same way, the event of the skirmish at Lexington, where the first blood flowed in the contest, was magnified by the one party into a disgraceful defeat, and treated by the other as a trifling affair, to which no regard whatever ought to be paid, far less any inference drawn as to the fate of the war. The battle of Bunkers' Hill, and all the transactions of the year 1775, were in like manner exaggerated by both parties, though in opposite directions; and the consequence of these misrepresentations was to fan the flame of mutual resentment.

Whilst these altercations continued to agitate the minds of the superior classes of people in Britain, the middle and lower ranks remained in a kind of indifference, or rather were opposed to the proceedings of ministry. This opposition, indeed, had no influence on the councils of the nation, but in other respects it proved exceedingly troublesome. The levies were obstructed, and the recruiting service was never known to go on so heavily; numbers of that description of persons who usually fill the ranks of the army not only refusing the usual offers, but even reproaching loudly the cause in which they were solicited to engage. Several officers of high rank also showed a dis-

inclination to the service. Lord Effingham, who had distinguished himself by his opposition to the ministerial measures, resigned the command of his regiment rather than fight against the cause which he had so warmly espoused; and his example was followed by that of several other officers. For this step Lord Effingham received the thanks of the cities of London and Dublin, both of which were extremely averse to hostilities with America; and the former, indeed, could scarcely restrain itself within any bounds of moderation. After the skirmish at Lexington, the city framed a remonstrance and petition, animadverting severely on the ministry and parliament; and it was not without the greatest difficulty that the more moderate party procured a counter-petition, couched in less reprehensible terms.

In the mean time serious inconveniences, arising from the stoppage of trade, began to be felt in different parts of the nation. The suspension of the sale and purchase of negro slaves in the West Indies and in North America, and the prohibition against exporting arms and gunpowder, had seriously impeded the trade of Bristol and Liverpool with Africa; in consequence of which a great number of ships which had formerly sailed from these ports were laid up, and nearly three thousand sailors belonging to Liverpool were thrown out of employment. These distresses, however, made no impression on administration; who having once laid it down as a maxim, that the subjection of America was the greatest political good that could happen to Britain, were, in a conformity with their own principles, obliged to consider every disaster that might occur during the prosecution of this object as a temporary inconvenience, which ought not to be put in comparison with the execution of so great and necessary a design. But whatever might be the views of administration in this respect, it was far otherwise with the generality of the nation. They felt severely the present inconveniences; whilst the probable subjugation of America afforded no solid reason to hope for an equivalent or compensation. It was with the utmost satisfaction, therefore, that they received the news of Mr Penn's arrival in 1775, with another petition from the congress, to be presented to the king in the first instance, and then given to the public. But their expectations were speedily disappointed. The petition was delivered to Lord Dartmouth on the first of September, and in three days afterwards it was stated that no answer would be given to it. This laconic reply excited no small surprise, more especially as the language of the petition was respectful, and expressed a strong desire for peace and reconciliation; and hence it could only be considered as a formal and deliberate, if not insulting, renunciation of all friendly intercourse with the colonies.

The rejection of this petition served to inflame, more than ever, the mutual resentment of the adverse parties. The obsolete distinction of Whig and Tory was now revived, with such animosity, that Britain itself, as well as America, seemed in danger of becoming the theatre of war and bloodshed. The Tories were accused of promoting sanguinary addresses, misinforming the government, and circulating false representations, in order to add fuel to the flame already kindled, and produce civil war. They were also upbraided with their attachment to the Stuart family; their incessant machinations to involve the country in civil war; the dissension at home and disgrace abroad which had invariably attended their councils; and their indifference to the honour and interest of the nation, which, from the peace of Utrecht to the present time, they had ever been ready to sacrifice for the advancement of their party. On the other hand, the Tories described the Whigs as the genuine descendants and representatives of the republican incendiaries who, in the last century, had overturned the

Reign of
George III.

ign of constitution and desolated the kingdom; as pretending, indeed, to uphold the liberty of Britain, but, under this mask, as desirous of engrossing all the authority to themselves, and of exercising arbitrary power under a mock semblance of freedom. The real question however was, whether the king and parliament, when united, were to be obeyed or resisted. The Tories insisted that they should be obeyed, the Whigs that they ought to be resisted; and hence there were two parties in Britain, the one of which was of opinion that the colonies, owing obedience to Great Britain in all cases whatsoever, ought, in case of refusal, to be compelled to obey; whilst the other, though it acknowledged as a general principle the existence of the same obligation, deemed it inexpedient and impolitic to enforce it.

The violence of these bickerings, however, was somewhat allayed by serious commercial misfortunes, which occurred about this time, and added greatly to the difficulties with which the government had to contend. During the last session of parliament, it had been affirmed that the bill for depriving the people of New England of the benefits of the Newfoundland fishery would redound to the interest of Great Britain, by throwing into her hands the profits which were formerly divided with the colonies. But this prediction was belied by the event. The number of ships fitted out this year was scarcely greater than usual, and the congress had prohibited them from being supplied with provisions; so that not only those on board the ships, but even the inhabitants on the island of Newfoundland itself, were in danger of perishing from want. Many of the ships, therefore, were obliged to go in quest of provisions instead of prosecuting the employment on which they had been sent; and, on the whole, instead of any increase, the profits of the fishery suffered this year a diminution of near £500,000. Nor was this all. A storm of unprecedented violence occurred in these latitudes during the fishing season; the sea rose fully thirty feet above its ordinary level, and with such rapidity, that no time was allowed for avoiding its fury: upwards of seven hundred fishing boats perished; and several ships foundered, with their whole crews. Nor was the devastation confined to the sea; for the waters broke in upon the land and occasioned prodigious loss and destruction. By these misfortunes, the general stagnation of commerce, and the little success which had hitherto attended the British arms, the mercantile portion of the nation was plunged in despair, and petitions were poured in from all quarters.

But ministers had determined on their course; and the only question now considered was, how it might be most effectually put in execution. For this purpose, application was made to the petty states of Germany, which were wont to hire out their forces, and had frequently sent auxiliaries to Britain in former cases of exigency. But the scheme was fraught with difficulties, owing to the distance of the scene of contest, and the danger of mercenaries deserting a cause in which they had no manner of concern. The princes were also alarmed at the probability of losing for ever so many of their subjects; whilst the latter were not less startled at the prospect of being transported across the ocean into a new world, there to be exposed to all the miseries of war, with very little hope of ever again beholding their native country. Other resources were however devised, such as calling in the assistance of the Hessians, and obtaining from Holland the body of Scottish troops which had been so long in their service. But in these views administration were in a great measure disappointed. All the states of Europe looked upon Britain with an invidious eye; particularly Holland and France, the two powers who had most reason to hope for advantage from the quarrel. In Holland a very strong party contended warmly for the American interest; pamphlets were daily published at

Amsterdam in justification of the colonies, whose case was compared to that of the Netherlands in former times; and the colonists were exhorted to persevere in their claims against the pretensions of Britain, which was represented as insatiably covetous of wealth and power; as domineering and intolerable, especially since her successes in the war of 1755; and as arrogating if not exercising an absolute sovereignty over the seas. But although these powers thus early expressed their hostile disposition towards Britain, it was otherwise with the Princes of Hesse and Brunswick, by whom a considerable number of troops was furnished; and, that as many British forces as possible might be employed, large draughts were made from the garrisons of Gibraltar and Minorca, which were supplied with an equal number of men from the electorate of Hanover. The garrison of Boston was liberally furnished with all sorts of necessaries; and although the expenditure already began to occasion considerable alarm, and to raise a suspicion that even the treasures of Britain would not be able to defray the charges of the war, yet some countervailing advantages were derived from this profusion; for the price of every thing was augmented, including that of shipping; and although the profits realized by contractors and their numerous friends occasioned complaints, great benefit accrued to multitudes employed in the various branches of the public service. Misfortune, however, seemed to attend every scheme in which Britain engaged, although in the present case it must, in part at least, be ascribed to mismanagement. The sailing of the transports for Boston was delayed till the proper season was lost. They remained for a long time wind-bound; and when at length they were enabled to weigh anchor, they met with such stormy weather that they were tossed about in the Channel till most of the live stock which they had on board perished. Nor did the misfortunes of the convoy end here. After clearing the coast of England, their progress was retarded by a continuance of foul weather; they were driven by the periodical winds from the coast of America; and while some made for the West Indies, others were captured by American privateers, and only a very few reached Boston, with their cargoes so much damaged as to be of little or no use whatever.

With respect to the parliamentary proceedings of this period little can be said, except that every measure of administration, whether right or wrong, was keenly opposed. The employment of foreign troops, and the admitting of them into the fortresses of Gibraltar and Minorca, were severely censured, as being contrary to the bill of rights. But the administration contended that this bill only forbade the introduction of a foreign military power into the kingdom during peace, that the times however were not peaceable, and that the introduction of the troops was evidently with a view to quell a rebellion. The force designed for the conquest of America was then declared to be inadequate to the purpose; but it was replied, on the part of ministry, that the design was to conciliate, not to conquer; that twenty-five thousand men were sufficient to strike terror; and that though this should not instantly be produced, conciliatory offers would still be held out after every blow that was struck.

In the mean time the Americans, sensible of the dangerous situation in which they stood, exerted themselves to the utmost to dislodge the British troops from Boston, which they at length accomplished in March 1776. They then proceeded to put their towns in a state of defence, and repulsed Sir Peter Parker at Charlestown; but they did not exert themselves with equal spirit in the defence of New York, where, besides losing the town, they sustained such a defeat as seemed to threaten their affairs with total ruin. This in fact was the view taken of their situation by the

Reign of
George III.

generality of the people in Britain. The successful campaign of 1776 was looked upon as so decisive, that little room remained for supposing the Americans capable of ever retrieving their affairs. Opposition were much embarrassed, being almost reduced to the single argument about the interference of foreign powers; whilst the obstinacy of the Americans in refusing the offers of Lord Howe, even at the moment of their greatest depression, seemed a very bad omen. The ministry, however, now became so powerful, that whatever they proposed was immediately carried. The number of seamen for 1777 was augmented to forty-five thousand, and upwards of five millions were voted for the expense of the navy, and for discharging its debt. The expenses of the land service amounted to nearly three millions, besides the extraordinary of the former year, which exceeded one million two hundred thousand pounds; and though this vast provision was the subject of great complaint and animadversion, the power of ministry silenced all opposition.

But however administration might now triumph, their exultation was of short continuance. The misfortune of General Burgoyne at Saratoga threw the whole nation into a kind of despair, and reduced the ministry to the utmost perplexity. The great difficulty now was to contrive means for raising a sufficient number of forces to carry on the war; but from this embarrassment they extricated themselves by encouraging levies for government service by cities and private persons; and as the design was kept a profound secret before the Christmas recess, they were not disturbed by the clamours of opposition. The recess was purposely extended in order to give time for the scheme to take effect; and before parliament met again it was actually accomplished, so that ministers could once more face their opponents without any fear.

Another and more weighty consideration, however, now occurred. The European states in general had long beheld the grandeur of Britain with an invidious eye. The news of the disaster at Saratoga was therefore received by them with the same undisguised exultation as the intelligence of the defeat of Charles XII. at Pultowa was by the powers whom he had so long overawed. Of these the French, for obvious reasons, were the most active in supporting the insurgent Americans. Numbers of the young nobility were eager to signalize themselves in the American cause; and among the rest the Marquis de la Fayette, a young nobleman of high rank and fortune, occupied a conspicuous place. Impelled by an enthusiastic ardour in favour of the American cause, he purchased a vessel, loaded her with military stores, and sailed with several of his friends to America, where he offered his services to congress; and meeting with a most gracious reception, he was invested with a command, in which he lost no opportunity of distinguishing himself. Besides this nobleman, several other officers from France and Germany actually entered the American service, and by their military talents greatly contributed to the exertions which the colonies were afterwards enabled to make. This assistance, however, would have been but trifling, had not the French court also interested itself in their behalf; and about the time when the news of General Burgoyne's disaster arrived in Britain, a treaty was on foot between the French court and the United States of America. Even before this time France had shown such a partiality towards the Americans, as might plainly have indicated a design of ultimately assisting them in their national capacity. The encouragement given to the American privateers in all the ports of France had produced strong remonstrances on the part of Britain; and an order was at length demanded that all these privateers with their prizes should depart the kingdom. With this the French court found it neces-

sary at that time to comply, lest reprisals should be made by capturing their whole Newfoundland fleet then engaged in the fishery. But so many delays were occasioned on various pretences, that not a single vessel was dismissed from any of their ports; and so far were the French court from entertaining any design of this kind, that in the month of July 1777 the whole body of merchants throughout the kingdom were assured by government that they might depend on protection for their trade with America. Meanwhile the greatest preparations for war were made throughout the whole kingdom of France; and, in fact, the most judicious politicians were of opinion that a rupture with that power would have immediately followed the commencement of hostilities with America. But, whatever might have been the motives of the British ministry, it is certain, that in defiance alike of probability, and of the acrimonious censures of opposition, they continued to pretend ignorance of any hostile intentions upon the part of France, until that country of its own accord thought proper to announce them. This was done by a formal notification to the court of Britain in the month of March 1778, couched in the most insolent terms. In this declaration it was announced, not only that a treaty of friendship and commerce had been concluded betwixt France and America, but Britain was insulted by being told that America was actually in possession of independence, as if the former had already exerted her utmost efforts without being able to reduce them. A merit was also made of having entered into no commercial stipulations in favour of France exclusive of Britain. Nothing, therefore, could be more offensive than this notification; and though it could not decently be said, on the part of the French monarch, that he wished for war, yet his pacific intentions were conveyed in such haughty terms, that the whole could only be considered as a declaration of that hostility which he pretended a desire to avoid.

Accordingly both parties now united in opinion that a war with France was unavoidable; but they were not for that reason any further advanced towards a reconciliation. It must be owned, indeed, that the minority had received great provocation. They had from the beginning reproached the American war, and prognosticated its bad success. In this they had been overruled, and the character of the Americans represented in such a manner as almost to preclude the notion of their being able to resist. They had resisted, however, and by destroying or taking prisoners a whole army, had verified the predictions which had so often been treated with ridicule. The same party had frequently insisted in the most earnest manner for some kind of concession towards America; but this had constantly been refused with an obstinacy equally unparalleled and inveterate. They now, however, saw the very concessions offered to America after the defeat of Burgoyne, which, if granted in time, would have prevented all the mischief that had happened. Add to this, that every inquiry into the measures of government had been frustrated; that a motion on the state of the nation, which could not be absolutely rejected, was rendered ineffectual by delays and evasion; and that the country was involved in war with a nation well provided for all emergencies, whilst we had supinely suffered them to go on without making the least effort to put ourselves in a proper state of defence. For these reasons opposition insisted that the present ministry ought no longer to be intrusted with the management of public affairs. An acknowledgment of the independence of America was now generally supposed to be the only rational step that could be taken, as it might at present be done with a good grace, and we should unavoidably be obliged to take it at last whether we would or not.

Reign of
George III.

Reign of George III. Notwithstanding the vehemence of these disputes, however, great courage and steadiness were manifested by the calm and deliberate portion of the nation. The French attempted to excite a general panic by threatening an invasion, which was evidently impracticable, until they had first obtained the superiority at sea; yet as multitudes in the country were apt to be terrified by the bare mention of a French invasion, orders were issued to call out and embody the militia, which was then composed of men in every respect as well exercised and disciplined as any regular troops. It was complained, however, that a French squadron of twelve ships of the line had sailed from Toulon without any obstruction, under the command of the Count d'Estaing. The most grievous apprehensions were entertained from the great inferiority of Lord Howe's naval force; a circumstance which might expose his fleet to a total defeat, and the whole convoy of transports to be taken or destroyed. But whatever might have been the probabilities of the case, the fortune or conduct of this commander were such, that none of the anticipated dangers occurred. Addresses were, however, moved for recalling the fleets and armies from America, in order to station them in places where they might contribute most effectually to the defence of the kingdom; but this was opposed by administration, and even by some of the most popular members of opposition, including Lord Chatham and the Earl of Shelburne.

The operations of the French in America, with the various success of the war, will be more fully related under the head of UNITED STATES. It is sufficient here to state that D'Estaing having equally failed in his attempt on the British fleet at New York, and in assisting the allies of France in their attempt on Rhode Island, sailed for the West Indies, where he attacked the island of St Lucia; but meeting with a repulse, he proceeded to Grenada, which he reduced, while a body of troops dispatched by him also took the island of St Vincent. By this time the French admiral had been powerfully reinforced, so that his fleet consisted of twenty-six sail of the line and twelve frigates. Whilst he was employed at Grenada, Admiral Byron, with the British squadron, accompanied the homeward-bound West India fleet till it was out of danger, and then sailed with a body of troops under General Grant for the recovery of St Vincent; but before reaching that island, certain intelligence was received of the descent made on Grenada. Byron then steered directly for that island, where, without hesitation, he encountered the French fleet, notwithstanding its great superiority. At this time the French squadron amounted to twenty-seven sail of the line and seven frigates; whilst that of Britain consisted only of twenty-one line-of-battle ships and one frigate. The British admirals, Byron and Barrington, endeavoured to bring the enemy to a close engagement; but this was as studiously avoided by D'Estaing; and such was the dexterity and circumspection with which he acted, that it was only during the transient movements occasioned by the wind and weather that some of the British ships could close in with their antagonists. But when these occurred, the encounter became so unequal, that the British ships were terribly shattered. For some time Captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet; and Captain Fanshaw of the Monmouth, a sixty-four gun ship, singly threw himself in the way of the enemy's van to stop them. Several of the British ships forced their way to the very mouth of St George's harbour in Grenada; but finding it in the hands of the French, an end was put to the action; nor did the latter care to renew it, although the British ships had suffered much from the greatly superior force to which they had been exposed.

D'Estaing having now received fresh reinforcements,

set sail for the continent of America, after convoying the homeward-bound fleet of French merchantmen on their return from the West India islands. He made an attempt on the town of Savannah, but was repulsed with great loss; and the result was, that the fears which had been excited by the superiority of the French in the West Indian seas were effectually dissipated. The islands of Dominica, St Vincent, and Grenada, were indeed lost, the first being taken by the Marquis de Bouillé, governor of Martinico, and the last two by D'Estaing, as already stated; but these successes were balanced by the failure of the French commander in every other enterprise, by his disaster at the Savannah, and by the acquisition of St Lucia, which was taken in the year 1778 by Admiral Barrington and Generals Prescott and Meadows. In other parts of the West Indian seas also the honour of the British arms was very effectually supported by the bravery and vigilance of the commanders on that station. Admiral Hyde Parker, assisted by Admiral Rowley, kept the enemy in continual alarm, and intercepted the trade of the French islands in such a manner as greatly distressed them. Three large frigates dispatched by Count d'Estaing after his failure in America were taken, and a great part of a convoy seized or destroyed in sight of M. de la Motte-Piquet's squadron in the harbour of Fort Royal at Martinico, the admiral himself having narrowly escaped. He had sailed out of the harbour in order to favour the escape of the convoy already mentioned, and, having partly effected his object, withdrew; but he was so closely pursued, that he had scarcely time to shelter himself under the batteries on shore. These successes, which occurred in the years 1778, 1779, and beginning of 1780, kept the event of the war pretty much in a state of equipoise on the western seas and continent; but in the meanwhile the most unhappy dissensions prevailed in every department of the British government in Europe, and threatened to involve the nation in confusion and bloodshed.

Among other charges brought by the opposition against the ministry, that of neglecting the navy was one of the most considerable; nor indeed does it appear that the charge was altogether groundless. Without a fleet, however, it was now impossible to ward off the danger of an invasion. At this time, indeed, it was in a very weak condition; but the valour and experience of the officers seemed in some measure to compensate every deficiency. The chief command was conferred on Admiral Keppel, who had served with great reputation during the last war; whilst Admirals Sir Robert Harland and Sir Hugh Palliser, both officers of undoubted courage and capacity, acted under him. On arriving at Portsmouth, towards the end of March 1778, Admiral Keppel exerted himself so effectually, that, exclusive of those ships which it was found necessary to dispatch to the coast of North America under Admiral Byron, a fleet of twenty sail of the line was got in readiness by the beginning of June, and ten more in a very forward state of preparation. At the head of this fleet Admiral Keppel sailed from Portsmouth on the 13th of June, in order to protect the commercial shipping expected from all parts of the world, and at the same time to watch the motions of the French fleet at Brest.

When the British fleet arrived off the coast of France, two French frigates approached in order to make observations. These proved to be the *Licorne* of thirty-two, and the *Belle Poule* of twenty-six guns. A signal to give chase was instantly made, and the *Milford* frigate having come up with the *Licorne* towards the close of the day, requested the French captain to heave to under the British admiral's stern. The latter refused; but a ship of the line coming up, compelled him to obey. Next morning the *Licorne* seeming by her motions to be altering her course, a shot was

Reign of George III.

Reign of
George III.

fired across her bows as a signal to keep it, upon which she discharged a broadside and a volley of small arms into the *America* of sixty-four guns which lay close to her, and immediately struck. The behaviour of the French captain was the more extraordinary, as Lord Longford, the captain of the *America*, was at that instant engaged in amicable conversation with him; but though such conduct merited severe chastisement, no return was made for this most unprovoked and wanton aggression. The *Arethusa* of twenty-six guns, commanded by Captain Marshall, with the *Alert* cutter, was meanwhile in pursuit of the *Belle Poule*, which was also accompanied by a schooner, and the chase was continued till both were out of sight of the fleet. On coming up, Captain Marshall informed the French captain of his orders to bring him to the admiral, and requested his compliance. The Frenchman refused to obey, upon which the *Arethusa* fired a shot across the *Belle Poule*, which the latter returned with a discharge of her broadside, and the engagement thus commenced continued upwards of two hours with the greatest fury. The *Belle Poule* was superior not only in numbers, but also in weight of metal; her guns being all twelve pounders, while those of the *Arethusa* were only six. But notwithstanding this inferiority, the latter maintained so desperate a fight, that the French frigate suffered a much greater loss of men than the British, having nearly a hundred killed and wounded, whilst the *Arethusa* scarcely lost half that number. During the engagement between the two frigates, Captain Fairfax in the *Alert* attacked the French schooner, which was of much the same force, and the contest continued two hours with great bravery on both sides, when the latter struck to the English cutter. The *Arethusa* received so much damage, that she became almost unmanageable; and although the captain endeavoured to put her in a condition to continue the engagement, he was unable to effect his object. Being at the same time upon the enemy's coast, and close in the shore, the danger of grounding in such a situation obliged him to act with the more caution, more especially as by this time it was midnight. Meanwhile the *Belle Poule* stood into a small bay surrounded with rocks, where she was protected from all attacks; and as soon as it was day-light, a number of boats came out from the shore, and towed her into a place of safety. Notwithstanding the evident superiority of force on the side of the French, this action was extolled by them as a proof of singular bravery, and the account of it received with as much triumph as if it had been a victory.

On the 18th of June, the day following the action with the *Belle Poule*, another frigate fell in with the British fleet, and was seized by the admiral's orders, on account of the behaviour of the *Licorne*. The capture of these French frigates furnished intelligence which proved of the utmost importance, at the same time that it was highly alarming. It was ascertained that the fleet at Brest consisted of thirty-two sail of the line and twelve frigates; and this proved in every respect a most fortunate discovery, as the admiral had under his orders only twenty ships of the line and three frigates. As the superiority of the enemy was so decided, and as the consequences of a defeat would have been fatal to this country, the admiral thought himself bound in prudence to return to Portsmouth for reinforcements. He reached Spithead on the 27th of June, and remained till the arrival of the ships from the Mediterranean and the Spanish and Portuguese trade; while the summer fleet from the West Indies brought him a further supply of seamen, and enabled him to put to sea again with an addition of ten ships of the line. But still there was a deficiency of frigates, owing to the great numbers on the American station, and the necessity of manning the ships of the line in preference to all others.

Reign of
George III.

In the mean time the preparations at Brest being fully completed, the French fleet put to sea on the 8th of July. It consisted of thirty-two sail of the line, besides a large number of frigates; and Count d'Orvilliers commanded in chief, while the other principal officers were Counts Duchaffault, de Guichen, and de Grasse, M. de Rochechoart and M. de la Motte-Piquet. A prince of the blood royal had also been sent to serve on board of this fleet; we mean the Duke of Chartres, son and heir to the Duke of Orleans, and first prince of the blood royal of France in the collateral line, who commanded one of the divisions in the capacity of admiral. On the 9th day of July, the British fleet sailed out of Portsmouth in three divisions; the first commanded by Sir Robert Harland, the third by Sir Hugh Palliser, and the centre by Admiral Keppel, accompanied by Admiral Campbell, an officer of great courage and merit. The French had been informed that the British fleet was greatly inferior to their own, which was true at the time when they received the information; and being yet unapprised of the reinforcement it had received, Count d'Orvilliers sailed at first in quest of it, intending to attack it while in the weak condition represented to him.

As the British admiral was equally intent on coming to action as soon as possible, they were not long before they met. The hostile fleets came in sight on the 23d of July; but the appearance of the British ships soon convinced the French admiral of his mistake, and he immediately determined to avoid an engagement as anxiously as he had formerly sought it; and in this he was favoured by the approach of night. All that could be done by the British, therefore, was to form the line of battle, in expectation that the enemy would follow the example. During the night the wind changed, and the French getting the weather-gage, had the choice of coming to action or of declining it entirely in their own power, whilst the British admiral was deprived of the opportunity of forcing them to engage as he had proposed. During the space of four days matters continued in this state; the French cautiously avoiding a battle, and the British beating up against the wind with a resolution to attack them. But notwithstanding all his efforts, the British admiral had the mortification to see his endeavours defeated by the vigilance and precaution of the enemy. The chase lasted till the 27th of July. But between ten and eleven in the morning of that day, an alteration of wind and weather occasioned several movements in both fleets, which brought them so near each other, that it was no longer in the power of the enemy to decline an engagement. Both fleets were now on the same tack, and had they so remained, the British fleet on coming up with the French would have had an opportunity of engaging ship to ship; but as this was a mode of combating quite contrary to the wishes of the enemy, their admiral, as soon as he found an action likely to ensue, put his ships on the contrary tack, by which means a close action was avoided. As soon as the van of the British fleet, consisting of Sir Robert Harland's division, came up, they directed their fire upon it, though at too great a distance to make any impression; but the fire was not returned by the British ships till they came close enough to do execution. In this manner the hostile fleets passed close to each other on opposite tacks, keeping up a very heavy and destructive fire.

The centre division of the British line having passed the rearmost ships of the enemy, the first care of the admiral was to renew the engagement as soon as the ships of the different fleets yet in action had got clear of each other respectively. Sir Robert Harland, with some ships of his division, had already tacked, and stood towards the French; but the remaining part of the fleet had not yet tacked, and some had dropped to leeward, and were repair-

ing the damages which they had received in the action. His own ship the Victory had suffered too much to tack about instantly; and had he done it he would have thrown the ships astern of him into disorder. As soon as it was practicable, however, the Victory wore, and steered again upon the enemy before any other ship of the centre division, not above three or four of which were able to follow the example. The other ships not having recovered their stations near enough to support each other on a renewal of the action, in order to collect them more readily for that purpose the admiral made the signal for the line of battle ahead. It was now three in the afternoon; but the ships of the British fleet had not sufficiently regained their stations to engage. The Victory lay nearest the enemy, with the four ships above mentioned, and seven more of Sir Robert Harland's division. These twelve were the only ships in any condition for immediate service; of the others belonging to the centre and to Sir Robert Harland's division, three were a great way astern, and five at a considerable distance to leeward, much disabled in their rigging. Sir Hugh Palliser, who commanded the rear division during the time of action, in which he had behaved with signal bravery, came of course last out of it, and, in consequence of the admiral's signal for forming the line of battle ahead, was to have led the van on renewing the fight; but his division was upon the contrary tack, and was entirely out of the line. The French, on the other hand, expecting to be directly re-attacked, had closed together in tacking, and were now spreading themselves into a line of battle. But on discovering the position of the British ships which had fallen to leeward, they immediately stood towards them in order to cut them off. This obliged the admiral to wear, and to steer athwart the enemy's foremost division, in order to secure them; directing, at the same time, Sir Robert Harland to form his division in a line astern, in order to confront the enemy till Sir Hugh Palliser should come up, and enable him to act more effectually. In moving to the protection of the leeward ships the admiral was now drawing near the enemy. As Sir Hugh Palliser still continued to windward, he made a signal for all the ships in that quarter to come into his wake, and Sir Hugh repeated this signal; but it was unfortunately mistaken by the ships of his division for an order to come into his own wake, which they did accordingly; and as he still remained in his position, they retained theirs of course. Sir Robert Harland was now directed to take his station ahead, and the signal was repeated for Sir Hugh Palliser's division to come into his wake; but this signal was not complied with, any more than a verbal message to that purpose, and other subsequent signals for Sir Hugh's division coming into its station in the line, before it was too late to recommence any operations against the enemy. In the night, the French resolved to put it wholly out of the power of the British fleet to attack them a second time; and for this purpose three of their swiftest sailing vessels were fixed in the stations occupied during the day by the three flag ships of the respective divisions, with lights at their mast heads, to deceive the British fleet into the belief that the French fleet kept its position with an intent to fight next morning. Protected by this stratagem, the remainder of the French fleet drew off unperceived during the night, and retired with all speed towards Brest, which they entered the following day. Their departure was not discovered till break of day; but it was too late to pursue them, as they were only discernible from the mast heads of the largest ships in the British fleet. The admiral then made the best of his way to Plymouth, as being the nearest port, in order to put his fleet into a proper condition to return in quest of the enemy.

This action, whatever might have been the merit of the

commanders, proved a source of fatal animosity. The bulk of the nation had so long been accustomed to hear of great and glorious victories at sea, that it was supposed a kind of impossibility for a French and British fleet to encounter without the total ruin of the former. The event of the last engagement, therefore, became an object of severe criticism; and complaints were made, that, through the bad conduct of the blue division, an opportunity had been lost of gaining a complete victory over the French fleet. These complaints were quickly introduced into the public papers; and were carried on with a warmth and vehemence which threw the whole nation into a ferment. The friends of Sir Hugh Palliser, the vice-admiral of the blue, were no less violent in the defence of his conduct than his opponents were in its condemnation; whilst those who espoused the cause of the admiral manifested equal determination in accusing him of being the real cause of the escape of the French fleet, through his disobedience of the signals and orders of his commander, and by remaining at a distance with his division, instead of coming to the assistance of the rest of the fleet. An accusation of so weighty a nature alarmed Sir Hugh Palliser, who in consequence applied to Admiral Keppel for a justification of his conduct, and required of him to sign and publish a paper relative to the engagement of the 27th of July, stating, that he did not intend by his signals on the evening of that day to renew the battle then, but only to be in readiness for the next morning. The admiral rejected this demand, on which Sir Hugh Palliser published, in one of the daily papers, a variety of details concerning the engagement, reflecting severely on the conduct of the admiral, and prefacing the whole by a letter signed with his name. An attack so public, and so detrimental to his character, induced Admiral Keppel to declare to the admiralty, that unless Sir Hugh Palliser explained this matter to his satisfaction, he could not, consistently with his reputation, ever again act in conjunction with that officer.

This altercation having occurred before the meeting of parliament, was of course noticed when it assembled. In the House of Peers an inquiry was demanded into the conduct of the commanders of the fleet on the 27th of July; and in the House of Commons it was urged, that as Admiral Keppel had expressed a public refusal to serve in conjunction with Sir Hugh Palliser, the cause of such a declaration ought to be investigated. Admiral Keppel and Sir Hugh Palliser, who were both present in the house upon this occasion, spoke severally on the point in question; and after a keen debate, a motion was made for an address to the crown to bring Sir Hugh Palliser to a trial for his behaviour in the late engagement with the French fleet. To this motion Sir Hugh Palliser replied, in a speech of great heat and vehemence, that he had already demanded and obtained a court-martial on Admiral Keppel, whom he now charged with having, through his misconduct, caused the failure of success in that engagement. This intelligence was received with astonishment in the house. It had been, and still continued to be, the general desire of individuals of all parties, to heal the breach between these officers at a time when the services of both were so much needed; and it was therefore with deep concern that the house learned the determination which had been taken to bring Admiral Keppel to a trial. The admiral, however, conducted himself on this occasion with remarkable temper and coolness. He acquiesced without reluctance in the orders which had been given him to prepare for a trial of his conduct; and he expressed a hope, that, upon inquiry, it would be found to have been neither dishonourable to his country nor discreditable to himself.

But the conduct of the board of admiralty in admitting

Reign of
George III.

the charges against Admiral Keppel, and appointing a trial, was strongly censured in the house, upon the ground that it was their duty to labour with the utmost earnestness, and exert their whole official influence, to stifle an unhappy disagreement, the consequences of which might be highly detrimental to the public service, instead of promoting the dispute, by consenting to bring it to a judicial and public hearing. On the other hand, it was observed, that the admiralty could not, consistently with the impartiality which they owed to every officer of the navy, refuse to receive all matters of complaint relating to subjects in their department; that they had no right to decide on the merits of any case laid before them, but were bound to refer it to a court composed of naval officers, who were the only proper and competent judges in professional matters; that, in conformity with these principles, they left the decision of the present altercation to the gentlemen of the navy, whose honour and integrity in all instances of this kind had never been called in question, and by whose verdict every officer in that branch of the service must wish to stand or fall. The arguments upon this subject being urged with much heat and vehemence, generated uncommon animosity, and gave rise to a spirit of contention which diffused itself among all classes of society. Individuals of every rank and profession engaged in it with as much zeal as if they had been personally concerned in the issue; and the dissatisfaction that prevailed among the upper classes in the navy appeared in a memorial presented to the king by twelve of the oldest and most distinguished admirals, at the head of whom was Lord Hawke, condemning the conduct of Sir Hugh Palliser without reserve, and censuring that of the admiralty itself, as establishing a precedent pregnant with the most ruinous consequences to the naval service. The majority of those who subscribed this memorial were not only officers of the highest rank and importance in the navy, but unconnected with the opposition, and attached by various motives to the court and ministry; so that their conduct in this instance must have been uninfluenced by party considerations.

No business of consequence was discussed in either house of parliament during the trial, which began upon the 7th of January 1779, and lasted till the 11th of February ensuing. After a lengthened and minute investigation, the court-martial acquitted Admiral Keppel, in the most complete and honourable manner, of all the charges which had been brought against him; he was declared to have acted the part of a judicious, brave, and experienced officer; and the accusation was censured in the severest manner. Both houses of parliament then voted him their thanks for the eminent services he had performed; the city of London conferred on him every mark of honour and respect it could bestow; and the nation re-echoed with his praise; whilst the resentment against his accuser was so strong as to constrain him to retire wholly from public life, and to resign all his employments. But notwithstanding the high degree of national favour and esteem in which Admiral Keppel stood, he thought it prudent to withdraw from a situation in which he found himself not acceptable to those in power, and accordingly resigned his command.

The conduct of those who presided at the admiralty board now became an object of severe censure; and a number of facts were cited to prove, that for many years past they had acted in a manner highly reprehensible. The debates were uncommonly animated; and a resolution for censuring the conduct of the admiralty was lost by a majority of only thirty-four. Administration, however, still kept their ground; and although a second attempt was made to show that the state of the navy was incommensurate with the vast sums bestowed upon it, the point

was again lost by nearly the same majority as before. But however victorious they might be in divisions, the conduct of the admiralty was far from giving general satisfaction. Following the example of Admiral Keppel, Lord Howe declared his resolution to relinquish the service while it continued under the present system of management; and his resignation was followed by that of Sir Robert Harland, Sir John Lindsay, and several others; nay, so general had the dislike to the service now become, that no fewer than twenty captains of the first distinction proposed to go in a body to resign their commissions at once; and they were prevented doing so only by the urgent occasion there was at that time for their services.

The same feeling which led to these resignations produced a direct attack upon Lord Sandwich, then first lord of the admiralty. But though in this as in other cases the ministry were victorious, they could not prevent an inquiry into the cause of our want of success in the American war. This was insisted upon by Lord Howe and General Howe, whose conduct had been so much reflected upon, that a vindication became absolutely necessary. The inquiry was indeed singularly disagreeable to the administration, and consequently evaded as long as possible. From the evidence of Lord Cornwallis and other officers of high rank, however, it appeared that the forces sent to America were at no time sufficient to reduce it; that the Americans were almost universally unfriendly to the British cause; and that from the nature of the country, the conquest of it would be attended with great difficulties. It was also proved, that, from its great strength, the camp of the Americans on Long Island could not have been attacked with any probability of success, after their defeat in 1776, owing to the want of artillery and other necessities. In every instance, therefore, the general's conduct was shown to have been judicious and proper. But these facts being directly at variance with the view which the ministry wished to countenance, counter-evidence was produced, in order to invalidate the testimony of the respectable witnesses above mentioned, and Major-general Robertson, and Mr Joseph Galloway, an American gentleman, were examined. According to the evidence of Mr Galloway especially, the conduct of General Howe had not been unexceptionable; the greater part of the Americans were friendly to the cause of Britain; the country was not so full of obstructions as had been represented; the woods and forests formed no obstruction to the marching of armies in as many columns as they pleased; and soldiers might carry provisions for nineteen days on their backs. Upon such extravagant assertions, proceeding undoubtedly from ignorance, no stress whatever could be laid; yet they fully answered the purpose of ministry at this time, namely prostration, and preventing the disagreeable truths elicited in the course of the inquiry from striking the minds of the public too forcibly.

The event of this inquiry, however, encouraged General Burgoyne to insist for an examination of his conduct, which indeed had been so unmercifully censured, that even the ministers began to think he had suffered too much, and that he ought to be allowed to vindicate himself. He was accordingly permitted to bring witnesses in his own behalf, and from the evidence produced, it appeared that he had acted the part both of a general and a soldier; that the attachment of his army to him was so great, that no dangers or difficulties could shake it; and that, even when all their patience and courage were found to be ineffectual, they were still ready to obey his commands, and die with arms in their hands. A great number of other particulars relating to his expedition were also cleared up; several charges against him were refuted; and it appeared that the Americans, far from being

the contemptible enemy they had been called, were introduced and resolute antagonists.

After the resignation of Admiral Keppel, the command of the Channel fleet was bestowed on Sir Charles Hardy, a brave and experienced officer, but now advanced in years, having retired from the service with the design of not returning to it, and being at that time governor of Greenwich hospital. The choice of an admiral to command this fleet was now of the greatest importance, on account of the accession of Spain to the general confederacy which took place during the present year. This determination was formally intimated by the Spanish minister on the 17th of June 1779, and was attended with new but ineffectual proposals for an accommodation with America, and the removal of the ministry. The imminent danger, however, to which the nation was now exposed, required vigorous exertion; and various projects for its internal defence were laid before the parliament. The spirit and magnanimity displayed on this occasion did the highest honour to the national character, and fully justified the opinion entertained of its valour and resources. All parts of the kingdom seemed actuated by a desire to concur in every measure necessary for its defence; large sums were subscribed by persons of rank and affluence; and companies were raised, and regiments formed, with an alacrity which quickly banished all apprehensions for the safety of the country.

On the other hand, the French, thinking themselves secure of victory by the accession of Spain, began to extend their schemes of conquest; and a squadron was fitted out under the command of the Marquis de Vaudreuil, destined to reinforce the fleet commanded by D'Estaing. But before proceeding to its destination, this squadron made an attack on the British settlements on the rivers Senegal and Gambia, which were easily conquered. On this occasion the French quitted their own island of Goree, which was soon afterwards taken possession of by Sir Edward Hughes, when on his way to the East Indies. But these distant conquests being insufficient to produce any serious impression, it was resolved to strike a blow nearer home, by the conquest of Jersey and Guernsey. An attempt was accordingly made on these islands, but with so little success that not a single man could be disembarked on the spot which they intended to conquer. The enterprise, however, proved indirectly serviceable to the cause of America. A fleet of four hundred merchantmen and transports was at this time on the point of sailing for New York, under the conduct of Admiral Arbuthnot; but that officer, informed of the attack on Jersey, thought it his duty to go to the assistance of that island rather than proceed on his voyage; and this delay was followed by another, occasioned by bad weather, so that the fleet, which was laden with warlike stores and necessities, did not arrive till the end of August, and several important enterprises projected by Sir Henry Clinton were in consequence abandoned. The French, however, determined to make a second attempt on Jersey; but their squadron, being attacked by another under Sir James Wallace, was driven on shore in a small bay on the coast of Normandy, under cover of a battery, and pursued by the British commander, who silenced the battery, took a thirty-four gun frigate, with two rich prizes, and burned two other frigates and several vessels besides.

Thus disappointed in the attempt on Jersey, the court of France next projected an invasion of Great Britain itself; and the preparations for the enterprise, whether serious or not, were so formidable, as justly to excite a considerable alarm in this country. Not only were the best troops in the French service marched down to the coasts of the British Channel, but transports were provided in great numbers, and many general officers promoted; the persons who were to command this important ex-

pedition were also named by the government. A junction was formed between the French and Spanish fleets, in spite of the endeavours of the British to prevent it; and the combined fleets made their appearance in the British seas with upwards of sixty ships of the line, besides a vast number of frigates and other armed vessels. But all this formidable preparation ended in the capture of only a single ship, the *Ardent*, of sixty-four guns. The combined fleets had passed the British fleet under Sir Charles Hardy in the mouth of the Channel without observing him; and then sailing along the coast of England, they came in sight of Plymouth, where they captured the *Ardent*, as already mentioned; after which they returned, without making the least attempt to effect a landing. The British admiral made good his entrance into the Channel without opposition, on the enemy quitting it, which a strong easterly wind obliged them to do; and he endeavoured to entice them up the Channel in pursuit of him; but the great sickness and mortality on board their ships obliged them to retire, in order, as they alleged, to recruit the health of their crews. Thus ended the first, and indeed the greatest exploit performed by the combined fleets in the British seas. An annual parade of a similar kind was afterwards kept up, and as formally opposed on the part of the British; but no act of hostility was ever committed by either of the Channel fleets against each other.

Though the pusillanimity manifested by the combined fleets was such that the French themselves were ashamed of it, the appearance of them in the Channel furnished opposition with abundance of matter for declamation. All ranks of men, indeed, now began to be wearied of the American war; and even those who had formerly been the most zealous in recommending coercive measures were at length convinced of their utter inutility. The calamitous effects produced by the continuation of these measures, indeed, had by this time rendered the greater part of the people exceedingly averse to the war; and the almost universal wish was, that the oppressive burden of the American contest should be cast off, and the entire national strength exerted against those whom we had been accustomed to consider as our natural enemies. Nevertheless, the national spirit continued to be exerted with unabated vigour. Large sums, subscribed in the several counties, were employed in raising volunteers, and forming them into independent companies; and associations were also entered into in the towns, where the inhabitants bestowed a considerable portion of their time in training themselves to the use of arms. The East India Company, too, forgot their quarrels with ministry, and not only presented government with a sum sufficient for levying six thousand seamen, but at its own cost added three seventy-four gun ships to the navy.

Administration, however, not yet weary of the plans which they had originally adopted, seemed still inclined to prosecute schemes of conquest. The virulence of opposition continued unabated; and, what was worse, every part of the kingdom seemed to imbibe the sentiments of the minority in parliament. Amongst the charges now brought against ministers was that of misapplying the national force. An hundred thousand men were employed for the internal defence of the kingdom. The army of Great Britain at this time fell little short of three hundred thousand men; the navy amounted to three hundred sail, including frigates and armed vessels; twenty millions had been expended on the service of the year 1779; and yet, with all this force and treasure, the utmost boast that ministers could make was, that the enemy had hitherto been kept at bay. Nor were the other charges of a less grave description. Veteran officers had been passed over to make room for persons of inferior merit; whilst the discontents and miserable state

Reign of
George III.

of Ireland, the loss of the West India islands, and other disasters, were all put to the account of ministers; and it was alleged that the universal cry of the nation was for their dismissal. To all this ministry replied by denying or attempting to refute every allegation, and at last, after several stormy debates, gained their point of an address without an amendment, by large majorities in both houses.

But the enormous expense incurred in carrying on the war occasioned such general alarm, that it was no longer possible to refuse complying with some scheme of economy, or at least giving it a patient hearing. The Duke of Richmond proposed that the crown should set the example, and moved for an address to this purpose; but the motion was negatived. The Earl of Shelburne next brought the subject under the consideration of parliament; and having, in a very elaborate speech, compared the expenses of former times with the present, and shown the immense disparity, he moved that the expenditure of the vast sums annually sunk in extraordinaries should be brought under some control, and that to extend the public expenses beyond the sums granted by parliament, was an invasion of its peculiar and exclusive rights. But although the Earl of Shelburne's motion was rejected, and some others of a similar tendency shared the same fate, the minds of the people were far from being conciliated to the views of ministers. On the contrary, an opinion began to prevail that they exercised an unconstitutional influence over the representatives of the nation, and that as this influence had recently been greatly augmented, nothing short of a change in the constitution of parliament could remedy the evil complained of. Accordingly, on the 30th of December 1779, a petition to this effect was framed in the city of York, where a number of the most respectable people in the county had assembled; and sixty-one gentlemen were appointed as a committee for carrying into effect the object contemplated by the petitioners. The York petition was followed by others of a similar description from twenty-seven of the principal counties and largest towns in England; while severe and even opprobrious language was used in the county meetings respecting both the ministry and the parliament.

The emissaries of America and the other enemies of Great Britain are said to have been active in fomenting these discords, which at this period rose to a height unknown for a century past. But the ministry continued firm, and, previous to taking any of the petitions into consideration, insisted on going through the business of the supplies.

At length, in the beginning of February 1780, a plan was brought forward by Mr Burke, for securing the independence of parliament, and introducing economy into the various departments of government. He proposed the abolition of the offices of treasurer, comptroller, and cofferer of the household; of treasurer of the chamber, master of the household, the board of green cloth, and several other places under the steward of the household; of the great and removing wardrobe, the jewel office, the robes, board of works, and the civil branch of the board of ordnance. Other reformatory measures were also suggested; but though the temper of the times obliged the minister to admit the bills, and even to pretend an approbation of the plan, he had no serious intention of acquiescing in the scheme to its full extent, or indeed in any part, if he could possibly help it. When the plan, therefore, came to be considered in detail, he was provided with objections to every part of it. But the general temper of the people without doors had now affected many of the members of parliament, and caused them to desert their old standard. An economical plan proposed in the House of Lords by the Earl of Shelburne was rejected by a narrow majority, and in the lower house matters went still

worse. The first proposition in Mr Burke's plan was to abolish the office of secretary of state for the colonies; and the utmost efforts of administration could preserve this office only by a majority of seven. The board of trade, however, was abolished by a majority of nine; but this was the only defeat sustained by ministry at present, all the rest of the plan being rejected excepting only one clause, by which it was enacted that the offices of lieutenant and ensign in the yeomen of the guards should no longer be sold, but given to officers in the army and navy on half pay, and of fifteen years' standing in their respective departments of service.

But the administration were destined to sustain a still more mortifying defeat than that which they had met with in the abolition of the board of trade. The 6th of April being the day appointed for taking into consideration the numerous petitions already mentioned, the subject of these was introduced by Mr Dunning, in an elaborate speech, in which he dwelt on the numerous attempts which had been made to introduce reformation and economy into the plans of government, and which had been defeated by ministerial artifice, or overthrown by mere dint of numbers; and he concluded by moving the celebrated resolution, that "the influence of the crown has increased, is increasing, and ought to be diminished." After a long and stormy debate, this motion was carried; upon which Mr Dunning further moved, that the House of Commons was as competent to examine into and correct abuses in the expenditure of the civil list as in any other branch of the public revenue; and this was followed by a third resolution, moved by Mr Thomas Pitt, that it was the duty of the house to provide an immediate and effectual redress of the abuses complained of in the petitions. The ministry now interposed with a request that nothing further might be done at that sitting; but such was the temper of the house, that both these motions were carried without a division.

Ministry had never experienced such a complete defeat, nor been treated with so much asperity of language. The news of the proceedings of the day were received by the people at large with as much joy as if a complete victory over a foreign enemy had been announced. Opposition, however, though masters of the field at present, did not imagine that they had obtained any permanent victory, and therefore resolved to make the most of the advantages they had gained. Accordingly, at the next meeting it was moved by Mr Dunning, that to ascertain the independence of parliament, and remove all suspicion of its being under undue influence, there should, every session, seven days after the meeting of parliament, be laid before the house an account of all the sums issued out of the civil list, or any other branch of the revenue, since the last recess, in favour of any of its members; and this passed with little difficulty. But when he moved that the treasurers of the chamber and household, the cofferer, comptroller, and master of the household, with the clerks of the green cloth, and their deputies, should be excluded from having seats in the house, a warm debate ensued, and the motion was carried only by a majority of two. This was the last triumph of the popular party; their next motion, for the exclusion of revenue officers, being thrown by a majority of twenty-seven. A final effort was however made by Mr Dunning, who proposed an address to the throne against proroguing or dissolving the parliament, until measures had been taken to prevent the improper influence complained of in the petitions; but on a division the motion was lost by a very considerable majority. Ministry would gladly have screened their friends from the vengeance of opposition, alleging the lateness of the hour, it being then past midnight; but the Speaker perceiving Mr Fox about

Reign of
George II.

Reign of George III. to rise, insisted that the house should remain sitting; and thus the deserters from the popular party were condemned to hear their conduct set forth in terms such as were never perhaps applied on any other occasion to members of the British senate.

The last victory of administration confirmed the unfavourable opinion which the people had conceived of the majority of their representatives; and in the height of the ill humour which the conduct of the parliament had created in the multitude, those discontents broke out which were so near involving the kingdom in a species of civil war. The hardships under which individuals of the Roman Catholic persuasion laboured in this country had lately engaged the consideration of enlightened and liberal-minded men; whilst the inutility as well as absurdity of persecuting people from whom no danger was to be apprehended, and who were not suspected of disaffection to the civil constitution of this country, had induced several persons of rank and influence to undertake to procure them relief from the disabilities under which they laboured. Meanwhile the calamities of the times had afforded the Catholics a proper occasion for manifesting their attachment to government; and accordingly they presented a loyal and dutiful address to the king, containing the strongest assurances of affection and fidelity to his person and civil government. They declared that their exclusion from many of the benefits of that constitution had not diminished their reverence for it; that they had patiently submitted to such restrictions and discouragements as the legislature thought expedient, and had thankfully received such relaxation of the rigour of the laws as the mildness of an enlightened age and the benignity of the British government had gradually produced; that they submissively waited, without presuming to suggest either time or measure, for such other indulgence as the happy causes alluded to could not fail in their own season to effect; that their dissent from the legal establishment in matters of religion was purely conscientious; that they held no opinions adverse to his majesty's government, or repugnant to the duties of good citizens; that they thought it their duty to assure his majesty of their unreserved affection to his government, of their unalterable attachment to the cause and welfare of the country, and their detestation of the designs and views of any foreign power against the dignity of the crown and the safety and tranquillity of the people; and that, though they did not presume to point out the particular means by which they might be allowed to testify their zeal and their wishes to serve the country, they would be perfectly ready, on every occasion, to give such proofs of their fidelity, and of the purity of their intentions, as his majesty's wisdom and the sense of the nation should at any time deem expedient. This address was presented to the king on the 1st of May 1778, and was signed by the Duke of Norfolk, the Earls of Surrey and Shrewsbury, the Lords Stourton, Petre, Arundel, Dormer, Teynham, Clifford, and Linton; and by a hundred and sixty-three commoners of rank and fortune.

The only obstacle which stood in the way was the difficulty of overcoming the prejudices of the lower classes, who were disposed to disapprove of and condemn any indulgence shown to those of a persuasion which they had been taught to regard with horror and detestation. But notwithstanding the prepossessions of the vulgar, it was resolved by several individuals of generous and liberal sentiments, to espouse their cause as far as it could be done consistently with the principles of the constitution and the general temper of the times. And the circumstance of their being patronized by some of the principal leaders of opposition was greatly in their favour; for it

showed that those who professed to be the most strenuous friends of freedom and the constitution did not imagine that these would be endangered by treating the Roman Catholics with more lenity than they had hitherto experienced. Accordingly, about the middle of May, Sir George Saville made a motion for the repeal of some of the disqualifications under which the Catholics laboured. He grounded his motion on the necessity of vindicating the honour and asserting the true principles of the Protestant religion, of which the peculiar merit consisted in an abhorrence of persecution. He represented the address above quoted as a convincing proof of the loyal disposition of the Roman Catholics, and as an unfeigned testimony of the soundness of their political principles; and, to silence the objections of those who might suspect the Catholics of duplicity, a test was proposed of so binding and solemn a nature, that no authority could annul its efficacy.

The pains and penalties of the statutes to be repealed were laid before the house by Mr Dunning. By these statutes it was made felony in a foreign clergyman of the Catholic communion, and high treason in one who was a native of this kingdom, to teach the doctrines, or perform divine service according to the rites, of that church; the estates of persons educated abroad in the Catholic persuasion were forfeited to the next Protestant heir; a son, or any other nearest relation, being a Protestant, was empowered to take possession of his own father's, or nearest kinsman's estate, during their lives; and a Roman Catholic was disabled from acquiring any legal property by purchase. The mildness of the British government did not indeed countenance the enforcement of the severities enacted by these statutes; but still the prospect of gain subjected every man of the Roman Catholic persuasion to the ill usage of informers; and on the evidence of such miscreants the magistrates were bound, however unwilling, to put these cruel laws in execution.

In consequence of such representations, the motion made in favour of the Roman Catholics was received without a dissentient voice; and a bill conformable thereto was brought into and passed through both houses. The test or oath to be taken by the Catholics was conceived in the strongest terms. They were to swear allegiance to the king's person and family, and to abjure especially the pretensions to the crown assumed by the person called Charles III. They were to declare their disbelief and detestation of the doctrines, that it is lawful to put individuals to death on pretence of their being heretics; that no faith is to be kept with heretics; that princes excommunicated by the pope and council, or by the see of Rome, or any other authority, may be deposed or murdered by their subjects or by any others; and that the pope of Rome, or any other foreign prelate or sovereign, is entitled to any temporal or civil jurisdiction or pre-eminence, either directly or indirectly, in this kingdom. And they were solemnly to profess, that they made the aforesaid declarations with the utmost sincerity, and in the strictest and plainest meaning of the words and language of the test, without harbouring a secret persuasion that any dispensation from Rome, or any other authority, could acquit or absolve them from the obligations contracted by this oath, or declare it null and void.

The favour shown to the Roman Catholics in England encouraged those of the same persuasion in Scotland to hope for a similar relief; and several Scottish gentlemen of high rank and character, who had seats in the house, not only expressed their warmest wishes for the extension of the indulgence to their own country, but declared their intention to bring in a bill for the purpose the ensuing session. The design was approved of by the General Assembly of the Church of Scotland; and a petition on behalf of the

Reign of George III.

Reign of
George III.

Roman Catholics in Scotland was in consequence prepared. But these favourable prospects were for a time obscured by a dense cloud of religious fanaticism, looming large and high in the political horizon. A pamphlet appeared, in which the doctrines and professors of the Roman Catholic religion were represented, the former as damnable, and the latter as the common foes of mankind and the disturbers of all states; and this inflammatory production being circulated among every class, raised up a great number of enemies to the intended petition. The opposition was at first chiefly conducted by persons at Edinburgh, who assumed the title of The Committee for the Protestant Interest, and under that denomination carried on a correspondence with all those who coincided in their opinions, being in fact a very large proportion of the common people in Scotland. This committee, from its residence in the capital of the kingdom, was naturally supposed to consist of persons of weight and influence; and hence it in a manner directed the motions of all the others. The persons of whom it was composed, however, acted from honest though mistaken views. They aimed only at the preservation of the Protestant religion and the liberties of their country, which they conceived to be endangered by the indulgence shown to individuals of the Roman Catholic persuasion; and, actuated by these ideas, they exerted themselves so effectually, that the principal gentlemen of the Catholic persuasion thought it requisite to convey to the ministry an intimation of their desire to desist for the present from applying for an indulgence similar to that which had been extended to their fellow-subjects of the same communion in England. They published also in the newspapers the representation which they had made to the ministry, in hopes of convincing the country that they were sincerely disposed to remove any cause of dissatisfaction on their own account, and to submit to any inconvenience rather than occasion disturbance, even in the prosecution of a lawful and praiseworthy object. But matters had now gone too far to be conciliated by any concessions.

On the 2d day of February 1779, the populace met according to appointment, in order to carry into execution the various projects which they had in contemplation. They began by an attack upon the house inhabited by the Roman Catholic bishop, and others of his persuasion, which they committed to the flames, together with the place of worship adjoining to it; and having in the same manner destroyed another house, which also contained a chapel, they proceeded to vent their resentment on several individuals of the same persuasion by burning their effects. The next objects of their vengeance were those who had patronised the Roman Catholics. They beset the houses of Dr Robertson and Mr Crosby; but the friends of these eminent persons, on hearing of the intentions of the rioters, came to their assistance in such numbers, and so well prepared to repel force by force, that the populace did not dare to commit the violence they had premeditated. This spirited conduct, which was followed by the adoption of the necessary precautions against their malevolent designs, put an end to the attempts of the mob at Edinburgh. But the spirit of dissatisfaction on account of the intended indulgence remained in full force; and ministry being held out as harbouring a secret determination to undermine the Protestant religion, and to introduce popery, were in consequence loaded with the most outrageous invectives.

Matters, however, did not stop here. The same ungovernable spirit was soon communicated to a part of the English nation; the cry against popery became daily louder among the inferior classes; and that inveteracy which time appeared to have mitigated began to revive in as powerful a degree as if the nation were actually under the impending horrors of persecution. To this were added

the secret fears of others, who still imagined that it was not inconsistent with good policy to discourage a religion, from the professors of which so much danger had accrued to the constitution of this country in former times, and who, though averse to acts of violence, thought it necessary to keep alive the antipathy to the ancient faith, and by no means to show a willingness to grant any further indulgence than it had hitherto experienced. On these grounds they were of opinion, that a suspension of the laws enacted against it, although tacit and unauthorized, was sufficient to remove all complaints of harshness and oppression on the part of the Roman Catholics; and they looked upon the penal statutes as a requisite bar to confine the Catholics within the bounds of due submission to the laws of a Protestant state.

Hence a society was formed in London, under the designation of the Protestant Association, and Lord George Gordon, who had rendered himself conspicuous in Scotland by his opposition to the repeal, was elected its president; and this body now prepared to act in a decisive manner against the resolutions of the legislature.

On the 29th of May 1780 the members of the association held a meeting in order to settle as to the manner in which they should present a petition to the House of Commons against the repeal of the penal statutes; and on this occasion a long speech was delivered by the president, who represented the Roman persuasion as gaining ground rapidly in the country, and affirmed that the only method of stopping its progress, was to go up with a spirited remonstrance to their representatives, and to tell them in plain and resolute terms that they were determined to maintain their religious freedom against all enemies, and at whatever sacrifice. This harangue being received with the loudest applause, Lord George next moved that the whole body of the association should meet on the second day of June, in St George's Fields, at ten in the morning, to accompany him to the House of Commons for the presentation of the petition; which was also assented to unanimously. Lord George then informed the meeting, that if he found himself attended by fewer than twenty thousand persons he would not present the petition; he directed them to form into four divisions, the first, second, and third consisting of those who belonged to the city, Westminster, and Southwark, and the fourth of the Scottish residents in London; and all were requested, by way of distinction, to wear blue cockades in their hats. Three days previous to the presentation of the petition, he gave notice of it in the ordinary form to the house, and stated the manner in which it was to be presented; but this was received with as much indifference and unconcern as all his former intimations.

On the second day of June, according to appointment, about fifty or sixty thousand persons assembled in St George's Fields; and drawing up in four divisions, as had been arranged, proceeded to the parliament house, with Lord George Gordon at their head. An immense roll of parchment was carried before them, containing the names of those who had signed the petition. On their way to the house they behaved with propriety and decency; but immediately on their arrival disturbances commenced. The rioters began by compelling all the members of both houses whom they met to put blue cockades in their hats, and call out "No Popery;" they forced some to take an oath that they would vote for the repeal of the popery act, as they styled it; and they treated others with great indignity, posting themselves in all the avenues to both houses, the doors of which they twice endeavoured to break open. But their rage was chiefly directed against the members of the House of Lords, several of whom narrowly escaped being murdered.

During these disturbances Lord George Gordon moved

Reign of George III. for leave to bring up the petition, which was readily granted; but when he moved that it should be taken into immediate consideration, his proposal was strenuously opposed by almost the whole house. Enraged at this opposition, he came out several times to the people during the debate, acquainting them how averse the house appeared to grant their petition, and naming particularly those who had spoken against it. Several members of the house expostulated with him in the warmest terms on the unjustifiableness of his conduct; and one of his relations, Colonel Gordon, threatened to run him through the moment any of the rioters should force their entrance into the house. It was some hours before the house could carry on its deliberations with any regularity, which was not done till the members were relieved by the arrival of a party of the guards. As soon as order had been restored, the business of the petition was resumed, when Lord George Gordon told the house that it had been signed by nearly a hundred and twenty thousand British Protestant subjects, and he therefore insisted that the petition should be considered without delay. But notwithstanding the dangers with which they were menaced, and the proof which the mover of the petition had given that no means would be left unemployed to compel them to grant it, the Commons continued immovable in their determination, and of two hundred members then present in the house, six only voted for taking the petition into immediate consideration.

In the mean time the mob had dispersed itself into various parts of the metropolis, where they demolished two Roman Catholic chapels belonging to foreign ministers, and openly vented the most terrible menaces against all persons of that persuasion. On the 4th of June they assembled in great numbers in the eastern parts of London, and attacked the chapels and houses of the Roman Catholics in that quarter, stripping them of their contents, which they threw into the street, and committed to the flames. They renewed their outrages on the following day, destroying several Romish chapels, and demolished the house of Sir George Saville, in resentment of his having brought into parliament the bill in favour of the Roman Catholics. On the 6th both houses met as usual; but finding that no business could be done, they adjourned to the 19th.

During this and the following days the rioters were absolute masters of the metropolis and its environs. Some of those who had been concerned in the demolition of the chapels belonging to foreign ministers having been seized and sent to Newgate, the mob collected before that prison, and demanded their immediate release; and this being refused, they proceeded to throw into the keeper's house firebrands and all manner of combustibles, which communicating fire to that and other parts of the building, the whole of the immense pile was soon in flames. Amidst this scene of confusion, the prisoners, amounting to about three hundred, were all released, including several who were under sentence of death. In the same manner they set fire to the King's Bench and Fleet prisons, and to a number of houses belonging to Roman Catholics. The terror occasioned by these incendiaries was such that most people hung out of their windows pieces of blue silk, which was the colour assumed by the rioters, and chalked on their doors and shutters the words "No Popery," by way of signifying they were friendly to their cause.

The night of the 7th of June concluded these horrors. Not less than thirty-six different conflagrations were counted at the same time. The Bank had been threatened, and was twice assailed; but being well guarded, both attempts failed. In the evening large bodies of troops arrived from all parts, happily in time to put a stop to the progress of the rioters, and falling upon them wherever they appeared, multitudes were killed and wounded, whilst num-

bers perished through intoxication. It was not until the afternoon of the 8th, however, that people began to recover from their consternation. During the greater part of the day, the disorders of the preceding night had created so terrible an alarm, that the shops were almost universally shut in every part of London. Nor were the melancholy effects of misguided zeal confined solely to the capital. The outrageous disposition of the populace was preparing to enact the like horrid scenes in other parts of England, and the mob actually rose in Hull, in Bristol, and in Bath; but through the timely interposition of the magistracy, these places were saved from their fury.

On the subsiding of this violent and unexpected commotion, Lord George Gordon was arrested, and committed close prisoner to the Tower after having undergone a long examination before the principal lords of the council.

On the 19th of June both houses met again pursuant to adjournment; and on this occasion a speech was read from the throne, acquainting them with the measures which had been taken in consequence of the disturbances, and assuring them of the readiness of the crown to concur in any measures that might contribute to the maintenance of the laws and liberties of the people. The speech was highly approved; but the conduct of administration was severely censured, and charged with unpardonable neglect for not calling forth the civil power, and employing the military in due time to obviate the mischiefs which had been committed. Ministry excused itself, however, on the ground of not having sufficient strength to answer all the demands of assistance that were made during the riots, and the absolute impossibility of suppressing them till the arrival of troops from the country. The various petitions which had been presented for the repeal of the act which had occasioned the riots, were now taken into consideration; but the house continued in the same mind as formerly. Nevertheless it was thought proper to yield somewhat to the prejudices of the people, by passing a bill for preventing persons of the popish persuasion from teaching or educating the children of Protestants; but this was afterwards thrown out by the Lords.

Nothing could have happened more opportunely for the ministry than the Protestant riots; for such were the alarm and terror occasioned by them, that the ardour which had been manifested in favour of popular meetings and associations, as they were called, for opposing the measures of government, was in a great degree suppressed. The county meetings were also represented as having a tendency, like the Protestant association, to bring on insurrections and rebellions; many began to consider all popular meetings as extremely dangerous; and among the commercial and monied classes, some were so panic-struck by the late riots, that all attention to the principles of the constitution was overruled by their anxiety about the preservation of their property. Had it not been for these events, it is probable that the spirit of opposition which then prevailed in the different counties would have compelled administration to make some concessions to the people.

In the suppression of these riots, however, the interference of the military without the command of the civil magistrate became a matter of suspicion to the country; and in the House of Lords the Duke of Richmond expressed a desire that some of his majesty's ministers would rise and give their lordships assurances, that the measures taken in order to suppress the riots, which were defensible only upon the ground of necessity, would be so stated, and that what had been illegally done, on the ground of necessity, would be cured by an act of indemnity. Various other observations were thrown out relative to the king's prerogative and to military law; upon which

Reign of George III.

Reign of
George III.

Lord Mansfield observed, that neither the king's prerogative nor military law had any thing to do with the conduct of government in their endeavours to quell the late outrages. All men, of all ranks, descriptions, and denominations, were bound, by their oath of allegiance, to interpose for the prevention of acts of high treason or felony, wherever any attempts to perpetrate such crimes were made in their presence, and were criminal if they refused to do so. In the whole of these proceedings, therefore, the military had not acted in their technical capacity as military, but had merely exercised their duty as civil men, which they, in common with other civil men, had both a right and an obligation to exercise. When a body of men were convened, without proceeding to the actual perpetration of treasonable or felonious acts, then the presence of the civil magistrate was necessary before the military could interpose at all; and for this reason, that as no acts of felony were committed, they could have no plea in their civil character for meddling at all. But by the statute law of the country, it became felonious in any combination of men to persevere in that combination after the riot act had been read by a justice of the peace; and this being done, they had then, and not till then, a constitutional reason for their interposition, namely, the privilege and duty of hindering the commission of felony whenever they had it in their power to do so.

This extraordinary doctrine was far from being agreeable to the nation in general, and was very freely censured in publications of all kinds. It was admitted, that if soldiers came accidentally as individuals to any place where felonies were committing, they might interfere, as well as others of the king's subjects, in the prevention of them. But this was a different case from that of bodies of armed troops being sent under officers commissioned by the king, and with orders to act against riotous and disorderly persons without any authority from the civil magistracy. The constitution of England knew no such character as a mercenary soldier, at the sole will of the executive power. Soldiers were held to their duty by laws which affected no other part of the community; and no soldier, as such, could be employed in the service of the constitution without a particular act of parliament in his favour. The idea that a military man was convertible into a soldier or a citizen, as royalty might move its sceptre, was a novelty got up for the present occasion. Mercenary armies were understood to consist of men who had either detached themselves or been forced from civil societies; and on these suppositions laws were made regarding their liberties and lives, such as no members of civil society could submit to. Soldiers were only tolerated by annual bills, and under repeated pretences; and the very idea of blending them with the common subjects of the state, and giving persons of their description a right of judging on its most important occurrences, would have filled our ancestors with horror. The laws tolerated an army for certain periods, and under certain restrictions; but there was no existing law which admitted the interference of the military in any of the operations of civil government. It was acknowledged that the late atrocious riots had rendered an extraordinary exertion of power absolutely necessary; but it was at the same time contended, that the interposition of the army in those outrages, without any authority from the civil magistrate, was an act of prerogative unconstitutional and illegal, although perfectly seasonable and beneficial. The public safety and benefit might sometimes excuse exertions of power, which would be injurious and tyrannical on ordinary occasions; but the utmost care ought to be taken that such extraordinary exertions should not be established as precedents, which might operate fatally to the constitution. If a large standing army was kept up,

and the king was understood to be invested with a power of ordering the troops to act discretionally whenever he should judge proper, without any authority from the civil magistrate, the people could have no possible security for their liberties.

We now proceed to notice the operations of the war, which, notwithstanding the powerful confederacy against Great Britain, were rather in her favour than otherwise. The Spaniards had commenced their military operations with the siege of Gibraltar, but with very little success; and the close of the year 1779, and beginning of 1780, were productive of considerable naval advantages to Great Britain. On the 18th of December 1779, the fleet under the command of Sir Hyde Parker in the West Indies captured nine sail of French merchant ships under the convoy of some ships of war; and two days afterwards he detached Rear-Admiral Rowley in pursuit of three large French ships, which were supposed to form part of M. la Motte-Piquet's squadron returning from Grenada. About the same time several other vessels were taken by the same squadron commanded by Sir Hyde Parker. On the 8th of January 1780, Sir George Brydges Rodney, who had been intrusted with the command of a fleet, one object of the destination of which was the relief of Gibraltar, fell in with twenty-two sail of Spanish ships, and in a few hours captured the whole fleet. In little more than a week afterwards the same fortunate admiral met with still more signal success. On the 16th of the month he engaged, near Cape St Vincent, a Spanish fleet, consisting of eleven sail of the line and two frigates, under the command of Don Juan de Langara. The Spaniards made a gallant defence; but four of their largest ships were taken, and carried into Gibraltar. These were, the *Phoenix* of eighty guns and seven hundred men, on board of which was the Admiral Don Juan de Langara; the *Monarca*, of seventy guns and six hundred men, Don Antonio Oyarvide commander; the *Princessa*, of seventy guns and six hundred men, Don Manuel de Leon commander; and the *Diligente*, of seventy guns and six hundred men, Don Antonio Abornoz commander. Two other seventy gun ships were also taken; but one of them was driven on shore on the breakers and lost, and the other was likewise driven on shore, but afterwards recovered. Four ships of the line and the two frigates escaped; but two of the former were much damaged in the action, during which one ship, the *San Domingo*, of seventy guns and six hundred men, was blown up. The five men of war taken were remarkably fine ships, and being afterwards completely refitted and manned, were put into the English line of battle. The Spanish admiral and his officers applied to Sir George Rodney to obtain the liberty of returning to Spain upon their parole of honour; but this he declined for some time, having received information that a great number of British seamen, who ought to have been released, were then prisoners in Spain. However, having afterwards received assurances that these captives would be immediately set at liberty, he released the Spanish admiral and officers upon their parole; and the prisoners in general were treated with a generosity and humanity which made a great impression upon the court of Madrid and the Spanish nation.

When Admiral Rodney had supplied the garrison of Gibraltar with provisions, ammunition, and money, he proceeded on his voyage to the West Indies; having sent home part of his fleet, with the Spanish prizes, under the command of Rear-Admiral Digby. On the twentieth of March an action was fought in the West Indies, between some French and English men of war, the former under the command of M. de la Motte-Piquet, and the latter, forming part of Sir Peter Parker's squadron, under that of Commodore Cornwallis. The contest was maintained

Reign of George III. on both sides with great spirit; but the French were at length forced to sheer off, and make the best of their way for Cape François.

Soon after Admiral Rodney had arrived in the West Indies, and assumed the command of his majesty's ships at the Leeward Islands, an action took place between the fleet under his orders and that of the French under the command of Count de Guichen. This occurred on the 17th of April. The British squadron consisted of twenty ships of the line, besides frigates; and the French fleet of twenty-three ships of the line, and several frigates. The action began a little before one, and continued till about a quarter after four in the afternoon. Admiral Rodney was on board the *Sandwich*, a ninety gun ship, which beat three of the French ships out of their line of battle, and entirely broke it. But the *Sandwich* and several other ships were so much crippled that an immediate pursuit was impossible, without compromising the safety of the disabled ships. The victory was accordingly claimed by both sides, but no ship was taken on either, and the French retired to Guadeloupe. Admiral Rodney's ship, the *Sandwich*, had suffered so much, that for twenty-four hours she was with difficulty kept above water. Of the British upwards of three hundred were killed and wounded in this engagement. On the 15th of May another action took place between the same commanders. But as it did not commence till near seven in the evening, and only a few ships were engaged, nothing decisive took place. The fleets met again on the 19th of the same month, when a third action ensued; but this, like the former, terminated without any material advantage to either side. On this occasion the British lost upwards of two hundred men killed and wounded; while, according to the French accounts, the total loss sustained by the enemy in the three actions, amounted to nearly a thousand killed and wounded. The preceding details show that the French at this time had a formidable fleet in the West Indies; and its force was augmented in June by the junction of a Spanish squadron near the island of Dominica; so that the French and Spanish fleets, when united, amounted to thirty-six sail of the line. Notwithstanding their superiority, however, they did not attack any of the British islands, nor even reconnoitre the fleet under the command of Sir George Brydges Rodney, which then lay at anchor in Gros Islet bay. By the vigilance and good conduct of the admiral, indeed, their efforts were in a great measure paralysed; and so sensible were the inhabitants of these islands of his services, that the houses of assembly of St Christophers and Nevis presented addresses to him, testifying their gratitude for the security which they enjoyed in consequence of his spirited and seasonable exertions.

In the month of June, Admiral Geary, who commanded the grand fleet, took twelve valuable merchant ships bound from Port-au-Prince to Bourdeaux and other ports of France; but in the month of July a very unexpected and important capture was made by the Spaniards, which excited considerable alarm in Great Britain. On the 8th of August, Captain Moutray, who had under his command the *Ramillies* of seventy-four guns, and two frigates, with a fleet of merchantmen bound for the East and West Indies under convoy, had the misfortune to fall in with the combined fleets of France and Spain, which had sailed from Cadiz the preceding day. The *Ramillies* and the two frigates escaped; but the rest were so completely surrounded, that five East Indiamen, and fifty merchant ships bound for the West Indies, were taken. This was one of the most complete naval captures ever made, and proved a heavy stroke to the commerce of Great Britain. The prize, however, great as it was, scarcely compensated the Spaniards for the capture of Fort Omoa, where upwards of

three millions of dollars were secured by the victors, and other valuable commodities, including twenty-five quintals of quicksilver, for extracting the precious metals from their ores, and the loss of which consequently rendered the mines useless.

But whilst the British were making the most vigorous efforts, and upon the whole gaining advantages over the powers who opposed them in the field, enemies were raised up throughout all Europe, who, by reason of their acting indirectly, could neither be opposed nor resisted. The power which most decidedly manifested its hostile intentions was Holland; but besides this, a most formidable confederacy, under the title of the Armed Neutrality, was formed, evidently with the design of crushing the power of Great Britain. Of this powerful confederacy the empress of Russia avowed herself the head; and her resolution was intimated on the 26th of February 1780, in a declaration addressed to the courts of London, Versailles, and Madrid. In this paper it was alleged, that her imperial majesty's subjects had often been molested in their navigation, and retarded in their operations, by the ships and privateers of the belligerent powers; that she found herself under the necessity of removing the vexations which were offered to the commerce of Russia, as well as to the liberty of commerce in general, by all the means compatible with her dignity and the welfare of her subjects; but that before adopting any serious measures, and to prevent all new misunderstandings, she thought it just and equitable to expose to the eyes of all Europe the principles which she had adopted as the guides of her conduct.

And these were contained in the following propositions: First, that neutral ships should enjoy a free navigation, even from port to port, and on the coasts of the belligerent powers; secondly, that all effects belonging to the subjects of the belligerent powers should be looked upon as free on board such neutral ships, excepting only such goods as were stipulated contraband; thirdly, that the principles recognised, and the articles enumerated as contraband, in the treaties between Great Britain and Russia in 1734 and 1766, should still be adhered to. In the former it was provided, that "the subjects of either party may freely pass, repass, and trade in all countries which now are, or hereafter shall be, at enmity with the other of the said parties, places actually blocked up or besieged only excepted, provided they do not carry any warlike stores or ammunition to the enemy," whilst, "as for all other effects, their ships, passengers, and goods, shall be free and unmolested; but," that "cannons, mortars, or other warlike utensils, in any quantity beyond what may be necessary for the ship's provision, and may properly appertain to and be judged necessary for every man of the ship's crew, or for each passenger, shall be deemed ammunition of war; and if any such be found, they may seize and confiscate the same according to law; but neither the vessels, passengers, nor the rest of the goods, shall be detained for that reason, or hindered from pursuing their voyage." And in the treaty of 1766 the same enumeration was given of the goods stipulated as contraband, as in the treaty of 1734. Her imperial majesty further proposed, fourthly, that in order to determine what characterizes a port blocked up, that denomination should not be granted, except to places before which there were actually a number of enemy's ships stationed near enough to render its entry dangerous; and, lastly, that these principles should serve as rules in judicial proceedings and in sentences as to the legality of prizes. Her imperial majesty declared, that she was firmly resolved to maintain these principles; that, in order to protect the honour of her flag and the security of the commerce and navigation of her subjects, she had given an order to fit out a considerable naval force; that

Reign of George III.

Reign of George III. this measure, however, would have no influence on the strict and rigorous neutrality which she was resolved to observe, as long as she should not be forced to depart from her principles of moderation and impartiality; and that it was only in such an extremity that her fleet would be ordered to act, wherever honour, interest, or necessity, should require. This declaration was also communicated to the States-general by Prince Galitzin, envoy extraordinary of Russia, who invited them to make common cause with the empress for the protection of commerce and navigation; and similar communications and invitations were made to the courts of Copenhagen, Stockholm, and Lisbon, in order, as was alleged, that the navigation of all the neutral trading nations might be established and legalized, and a system adopted founded upon justice, and calculated to serve as a sort of maritime code for future ages.

The memorial of the empress of Russia, though proceeding upon principles unfavourable to the views of Great Britain, and incompatible with her maritime superiority, received a civil answer from that court; but other powers, as might have been expected, received it with far greater cordiality. In the answer of France it was observed, that what her imperial majesty claimed from the belligerent powers was nothing more than the rules prescribed to the French navy; the execution of which was maintained with an exactness known and applauded by all Europe. Strong approbation was expressed of the principles and views of her imperial majesty; and it was declared, that from the measures now adopted by Russia, solid advantages would undoubtedly result, not only to her subjects, but also to those of all nations. Sweden and Denmark likewise acceded formally to the armed neutrality proposed by Russia; and the States-general, after an interval of some months, followed their example. It was further resolved by the parties to this armed league, to make common cause at sea against any of the belligerent powers who should violate, with respect to neutral nations, the principles which had been laid down in the memorial of Russia.

But though the British ministry could not openly engage in war with all the other powers of Europe, they determined to take signal vengeance on the Dutch, whose base ingratitude and perfidy now became a subject of general speculation. It has already been observed, that ever since the commencement of hostilities with the Americans, the Dutch had shown a decided inclination in their favour; and this partiality continued to be evinced to a degree beyond what might have been expected from the natural avidity of a mercantile people. Frequent memorials and remonstrances had in consequence passed between the two nations, and the breach gradually grew wider and wider, until at last matters came to extremities, by a discovery that the town of Amsterdam was about to enter into a commercial treaty with America. This came to light in the beginning of September 1780, by the capture of Mr Laurens, lately president of the American congress, and who had been empowered by that

body to conclude a treaty with Holland. Mr Laurens himself was instantly committed prisoner to the Tower, and a spirited remonstrance was addressed to the states of Holland, requiring a formal disavowal of the transaction. The states, however, answered evasively, that they would take the matter into consideration according to the forms and usages of the country, and that a reply would be given as soon as the nature of their government would admit.

The British government could not possibly mistake this pitiful equivocation; and accordingly the most vigorous measures were instantly resolved on. On the 25th of January 1781, it was announced to the House of Commons that his majesty had directed letters of marque and reprisal to be issued against the States-general and their subjects. For the causes and motives of his majesty's conduct in this respect, the house were referred to a public manifesto against that republic, which had been ordered to be laid before parliament. The charges against the republic were briefly summed up by Lord North in his speech on the occasion. The states, he said, had, in open violation of treaties, not only refused to give Great Britain that assistance which those treaties entitled her to claim when attacked by the house of Bourbon, but had also, in direct violation of the law of nations, contributed to furnish France with warlike stores, and had now at length thought proper to countenance the magistracy of Amsterdam in the insult which they had offered to this country, by entering into a treaty with the rebellious colonies of Great Britain, as free and independent states. By the treaty of 1678, it had been stipulated, that in case Great Britain was attacked by the house of Bourbon, she had a right to take her choice of either calling upon the States-general to become parties in the war, and to attack the house of Bourbon within two months, or of requiring an aid of six thousand troops and twenty ships of war, which the states were to furnish immediately after the claim was made. But though this country had always preserved inviolate her faith with Holland, yet that republic had refused to fulfil the terms of this treaty. The States-general had also suffered Paul Jones, a Scotsman, and a pirate, acting without legal authority from any acknowledged government, to bring British ships into their ports, and to refit there.¹ A rebel privateer had in like manner been saluted at the Dutch island of St Eustatius, after she had been suffered to capture two British ships within cannon-shot of their forts and castles. A memorial had been presented at the Hague in June 1779, on the breaking out of the war with Spain, to claim the aid we were entitled to require by the treaty of 1678; but of this not the least notice had been taken on the part of the states. Two other notices had since been delivered, each of which met with the same reception. The British ministry had done all in their power to bring the states to a true sense of their interest; and when the necessity of the case compelled them to seize on the Dutch ships carrying stores to France, they had paid the full value of the cargoes, and returned the ships; so that neither the private merchant, the private adventurer, nor the

¹ This man, who had formerly been a servant in Lord Selkirk's house, had landed in 1778, and plundered it of the plate, but without doing any further mischief. The action, however, proved very disagreeable to his own party; and, at the desire of Dr Franklin, the plate was afterwards restored. After this exploit he attempted to set fire to the town of Whitehaven, but without success. In 1779 he made a descent on the coast of Ireland, but without committing any act of hostility: his people indeed carried off some sheep and oxen, but their captain paid liberally for what they had taken. In the month of September 1779, he appeared in the Frith of Forth with several prizes, and advanced up above the island of Inchkeith, so as to be nearly opposite to Leith. His design was supposed to have been to burn the shipping there; but he was prevented from attempting this by a strong westerly wind; and such measures were also taken for the defence of the harbour, by erecting batteries and otherwise, that he would probably have miscarried had any attempt been made by him. On leaving the coast of Scotland he fell in with the Serapis and Scarborough, both of which he took after a desperate engagement, in which these vessels were reduced to almost total wrecks. These prizes were carried by Jones into a Dutch harbour; and it was this transaction to which Lord North now alluded. He was called a pirate, on account of his not being at that time properly furnished with a commission either from France or America; though this was denied by the opposite party.

states, had suffered any loss.' France only had felt the inconvenience, by her being deprived of that assistance which she would have received from those cargoes. The minister lamented the necessity of a war with Holland; but it appeared to him to be unavoidable. The difficulties with which the nation had to struggle were certainly great; but they were by no means insuperable. He was neither desirous of concealing their magnitude, nor afraid to meet them, great as they must be acknowledged; convinced, that when the force of this country was fully exerted, it would be found equal to the contest, and that the only means of obtaining an honourable and a just peace, was to show ourselves capable of carrying on the war with spirit and vigour.

But before this resolution could have been communicated officially to the naval commanders in the West Indies, the Dutch were actually attacked. The island of St Eustatius was, on the 3d of February 1781, summoned by Admiral Rodney and General Vaughan to surrender to the arms of Great Britain, and only one hour was given for consideration. Submission was inevitable. The island accordingly surrendered; the property found on it was confiscated, and a sale instituted, with circumstances of rapacity which afterwards became the subject of a discussion in parliament, and drew upon the nation the ill will of all Europe. The Dutch in fact seem to have acted with great imprudence, and, notwithstanding their provoking conduct towards Britain, to have made no preparations for war in the event of being attacked. But in spite of this inactivity, they still retained much of their ancient valour, and were in fact the most formidable naval enemies whom Britain had to contend with.

By August 1781 they had equipped a considerable squadron, the command of which was given to Rear-admiral Zoutman; and on the 5th of that month this squadron fell in with the British fleet commanded by Admiral Hyde Parker. The force under Zoutman consisted, according to the Dutch account, of one ship of seventy-four guns, one of sixty-eight, one of sixty-four, three of fifty-four, and one of forty-four, besides frigates; but the English account states the hostile fleet to have consisted of eight two-decked ships. No gun was fired on either side till the fleets were within half musket-shot distance. The action began about eight in the morning, and continued with the utmost fury for three hours and forty minutes. Both sides fought with equal ardour, and little advantage was gained by either. When the action ceased, both squadrons lay like logs on the water; but after a time the Dutch ships of war, with their convoy, bore away for the Texel, whilst the English were too much disabled to follow them. A Dutch seventy-four gun ship sunk soon after the action. On board the British fleet upwards of four hundred were killed and wounded; and the loss of the Dutch was probably greater. Admiral Zoutman, in his account of the engagement, states that his men fought like lions; and the British admiral, in the dispatch transmitted by him to the admiralty, observes that his majesty's officers and men behaved with great bravery, nor did the enemy show less gallantry.

The impossibility of crushing the power of Great Britain by any force whatever was now beginning to be evident even to her most inveterate enemies. In Europe, the utmost efforts of France and Spain were able to effect nothing more than the annual parade of a mighty fleet in the Channel; and this called forth the apparition of a British fleet, so formidable that the enemy never durst attack it. The states of Holland had sent out their force; and this too was opposed by one which, if insufficient to conquer, was at least able to prevent their effecting any thing detrimental to our possessions. In the East Indies

the united powers of the French and Indians had been conquered, and the Dutch settlements had suffered severely.

In the year 1781, however, the British naval power in the West Indies seemed to sink, and some events took place which threatened serious results. This was owing to the great superiority of the combined fleets of France and Spain, by which that of Britain was now so far outnumbered, that it could not achieve any thing of consequence. An ineffectual attempt was made by Admiral Rodney on the island of St Vincents, and an indecisive engagement took place on the 28th of April 1781, between Admiral Hood and the Count de Grasse, the event of which, however, was certainly honourable to Britain, as the French had a superiority of six ships of the line. But the damage done to the British ships having obliged them to retire to Barbadoes to refit, the French availed themselves of the opportunity to effect a descent on the island of Tobago; and although the governor made a gallant resistance, he was at last obliged to surrender. Admiral Rodney had sent Rear-admiral Drake with six sail of the line, three frigates, and some troops, to the assistance of the island; but they were dispatched too late, as the island had capitulated before the intended relief could have reached it.

But the great and decisive stroke, which happened this year, was the capture of Lord Cornwallis, with the division of the army under his command, at Yorktown. This was a great calamity; and other events were sufficiently mortifying. The province of West Florida had been reduced by the Spaniards; Minorca was besieged by them with every prospect of success; the island of St Eustatius had been surprised by the French; and in short every circumstance seemed to proclaim the necessity of putting an end to a war so calamitous and destructive. But all the disasters which had yet happened were insufficient to induce the ministry to abandon their favourite scheme of war with the colonies.

The parliament met on the 27th of November 1781. It has already been stated, that in the year 1780 the ministry had sustained a defeat so signal as seemed to prognosticate the ruin of their power. They had indeed afterwards acquired a majority, and the terror produced by the riots had contributed not a little to the re-establishment of their influence. The remembrance of what had passed, however, most probably induced them to dissolve parliament; whilst the successes at Charlestown and in other parts of America once more gave them a decided majority in both houses. But the disasters of the year 1781 involved them in the most serious difficulties. In the speech from the throne, his majesty observed, that the war was still unhappily prolonged by the restless ambition which had first excited the enemies of his crown and people to commence it. But he should not discharge the trust committed to the sovereign of a free people, nor make a suitable return to his subjects for their zealous and affectionate attachment to him, if he consented to sacrifice, either to his own desire of peace, or to their temporary ease and relief, those essential rights and permanent interests, upon the maintenance and preservation of which the future strength and security of Great Britain must depend. The events of war, he said, had been very unfortunate to his arms in Virginia, having ended in the loss of his forces in that province; but the misfortune in that quarter called loudly for the firm concurrence and assistance of parliament, in order to frustrate the designs of the enemy, which were as prejudicial to the real interests of America as to those of Great Britain. His majesty regretted much the additional burdens which a continuance of the war would unavoidably bring upon his subjects; but he still declared his perfect conviction of the justice of his cause, and hoped that, by the concurrence and support of his parliament, by the valour of his

Reign of George III. fleets and armies, and by a vigorous, animated, and united exertion of the powers and resources of his people, he would be enabled to restore to his dominions the blessing of a safe and honourable peace.

A motion for an address of thanks, couched in the usual style, was made in the House of Commons; and it was urged, that a durable and advantageous peace could result only from the firm, vigorous, and unremitting prosecution of the war, and that the present was not the time to relinquish hope, but to resolve upon exertion. The motion, however, was vehemently opposed by Mr Fox and Mr Burke. The latter remarked, that if there could be a greater misfortune than had already been inflicted on this kingdom in the present disgraceful contest, it was hearing men rise up in the great assembly of the nation to vindicate such measures. If the ministry and the parliament were not to be taught by experience,—if neither calamities could make them feel, nor the voice of God make them wise,—what had this fallen and undone country to hope for? A battle might be lost, an enterprise might miscarry, an island might be captured, an army might be lost in the best of causes, and even under a system of vigour and foresight; because the battle, after all the wisdom and bravery of man, was in the hands of heaven; and if either or all of these calamities had happened in a good cause, and under the auspices of a vigilant administration, a brave people would not despair. But it was not so in the present case. Amidst all their sufferings and their misfortunes, they saw nothing so distressing as the weakness or wickedness of their ministers. They seemed still determined to go on, without plan and without foresight, in this war of calamities; for every thing that happened in it was a calamity. He considered them all alike, victories and defeats; towns taken and towns evacuated; new generals appointed, and old generals recalled; they were all alike calamities in his eyes, for they all spurred us on to this fatal business. Victories gave us hopes, defeats made us desperate, and both instigated us to go on. In the course of the debate, it was contended on the part of administration, and particularly by Lord North, that by the address, as originally proposed, the house did not pledge themselves to any continuance of the American war; but this was strongly denied by the gentlemen in opposition. However, the point was at last decided in favour of ministry by a large majority; and the address was then carried as originally proposed. In the House of Peers, a motion for an address similar to that of the House of Commons was made by Lord Southampton, and seconded by Lord Walsingham; but it was vigorously opposed by the Earl of Shelburne and the Duke of Richmond, whilst Lord Stormont and the lord chancellor defended the course adopted by ministers; and the address was ultimately carried by a majority of more than two to one. A short protest against the address was, however, entered by the Duke of Richmond, the Marquis of Rockingham, and Earl Fitzwilliam; in which they declared that they dissented, for reasons too often urged in vain for the last seven years, against the ruinous prosecution of the unjust war carrying on by his majesty's ministers against the people of North America, and too fatally confirmed by repeated experience, and the disgraceful loss of a second army, to stand in need of repetition.

Though ministers thus succeeded in carrying the addresses in the usual form, they did not meet with equal success in their main design of carrying on the war. After the debate on the number of seamen, which was fixed at one hundred thousand for the ensuing year, Sir James Lowther moved as a resolution of the house, that the war carried on with America had been ineffectual for the purposes for which it was undertaken; and that all further

attempts to reduce that continent by force of arms would be in vain, and must be injurious to this country, by weakening her power of resisting her ancient and confederated enemies. This was supported by a number of arguments interlarded with the most severe reflections on the conduct of ministers. But the motion was opposed by Lord North, who said that, if agreed to by the house, it would put an end to the American war in every shape, and even cripple the hands of government in other respects. It would point out to the enemies of this country what were to be the mode and conduct of the war; and thus inform the enemy in what manner they might best point their operations against this country during the next campaign. With respect to the American war in general, his lordship acknowledged that it had been extremely unfortunate; but he affirmed that the misfortunes and calamities which had attended it, though of a most serious and fatal nature, were matters rather to be deplored and lamented as the events of war, in themselves perpetually uncertain, than to be ascribed to any criminality in ministers. He added, that though he totally disapproved of the motion, yet he was willing to declare it to be his opinion, that it would not be wise nor right to go on with the American war as we had hitherto done; that is, to send armies to traverse from south to north the provinces in their interior parts, as had been done in a late case, and which had failed of producing the intended and desired effect.

On the other hand, General Burgoyne observed, that declaring a design of maintaining posts in America, of the nature of New York, was declaring a design of offensive war; and that such a maintenance of posts would prove an improvident and preposterous mode of warfare. With regard to the American war, the impracticability of it was a sufficient justification for supporting the present motion. But he was now convinced that the principle of the American war was wrong, though he had not been of that opinion when he formerly engaged in the service in America. He had been brought to this conviction by observing the uniform conduct and behaviour of the people of America. Passion, prejudice, and interest, might operate suddenly and partially; but when we saw one principle pervading the whole continent, and the Americans resolutely encountering difficulty and death for a course of years, it must be a strong vanity and presumption in our own minds which could lead us to imagine that they were not in the right. It was reason, and the finger of God alone, which implanted the same sentiment in three millions of people.

After some further debate, Sir James Lowther's motion was rejected by a majority of two hundred and twenty to one hundred and seventy-nine. This, however, was a majority in which the ministry had little reason to exult, as it was sufficiently apparent, from the numbers who voted against administration, that the uninfluenced sense of the house was clearly and decisively against any further prosecution of the American war.

Other arguments to the same purpose with those of General Burgoyne, just mentioned, were used in the debate on the army estimates. On the 14th of December, the secretary at war informed the house, that the whole force of the army, including the militia of this kingdom, required for the service of the year 1782, would amount to one hundred and eighty-six thousand two hundred and twenty men, and for this force the parliament had to provide. The sum required for these troops for pay, clothing, and other articles, amounted to four millions two hundred and twenty thousand pounds. This military force exceeded that of the last year by upwards of four thousand men; and the expense was consequently greater by upwards of twenty-nine thousand pounds. The increase was occasioned by the greater number of troops already sent, or then going, to

Reign of George III. the East Indies. But the expense of those troops was to be reimbursed by the East India Company. After some further statements relative to the military force of the kingdom, and its expense, had been made by the secretary at war, Colonel Barré declared, that the estimates of the army as then laid before the house were scandalous and evasive. There was a much greater number of non-effective men than was stated in the estimates; in fact, they amounted to a fifth part of the army. The house should also recollect, that the estimates lying on the table did not compose the whole expense of the army; for extraordinaries of several millions were yet to come. Neither were the men under the several descriptions given by the secretary at war the whole number of military force employed. Other troops were employed solely at the discretion of the minister, and paid irregularly and unconstitutionally, without the consent or knowledge of the legislature; particularly the provincial corps in America, amounting to nine thousand men in actual service, the statement of which force, though it had been called for from year to year, was never brought into the estimates. Lord George Germaine explained, that the reason why the provincial corps had not been included in the estimates was, that some share of the public money might be spared, by avoiding to vote an establishment for these troops. They were raised and paid in a manner by much the most economical for the nation. Sir George Saville expressed the strongest disapprobation of any further prosecution of the American war, or of raising any more troops for that purpose. General Conway also disapproved entirely of a continuance of the American war in any form. He considered an acknowledgment of the independence of America as a severe misfortune, and a heavy stroke against Great Britain; but of the two evils he would choose the least, and submit to the independence of America rather than persist a day longer in the prosecution of a ruinous war. Notwithstanding these and other arguments, however, the question was carried in favour of ministry by a considerable majority, and the supplies were voted accordingly.

Besides the grand question of the continuance of the American war, several other matters of smaller moment were agitated during this session, particularly the affair of St Eustatius, already mentioned, and an inquiry into the state of the navy. But on these, as on the greater question, the ministry prevailed, though not without a strength of opposition which they had seldom encountered before. A motion for censuring Lord Sandwich was lost only by nineteen; and so general was the desire for a change of administration, that it excited surprise how the ministry still retained their places. Nothing could place in a more striking point of view the detestation in which they were held, than the extreme repugnance to the admission of Lord George Germaine to the dignity of the peerage. On this occasion the affair of Minden was not only brought above board; but, after his actual investiture, and when he had taken his seat in the house, under the title of Lord Viscount Sackville, a debate ensued respecting the dishonour which the peers had sustained by his admission into their house. The Marquis of Caermarthen moved, that it was reprehensible in any minister, and highly derogatory to the honour of the house, to advise the crown to exercise its indisputable right of creating a peer, in favour of a person labouring under the heavy censure of a court-martial; and urged, in support of his motion, that the House of Peers being a court of honour, it behoved them most carefully to preserve that honour uncontaminated, and to endeavour to mark, as forcibly as possible, the disapprobation which they felt at receiving into their assembly, as a brother peer, a person stigmatized in the orderly books of every regiment in the ser-

vice. The Earl of Abingdon could not help conceiving, that although there was not a right of election, there must be a right of exclusion vested in the house, when the admission of any peer happened to be against the sense of its members; that he considered the admission of Lord George Germaine to a peerage as an insufferable indignity to the house, and as an outrageous insult to the people; that it was an indignity to that house, inasmuch as it connected them with one whom every soldier was forbidden to associate withal; and that it was an insult to the people, as the person now raised to the peerage had done nothing to merit honours superior to his fellow-citizens. Lord Sackville defended himself as well as he could against this attack. He denied that he knew by whose advice he had been raised to the peerage; he impugned the justice of the sentence of the court-martial; he represented himself as the victim of an acrimony and hostility without example; he adverted to the time which had elapsed since the sentence of the court-martial was pronounced, and to the political offices which he had since been called to fill; and he contended that his elevation to the dignity of the peerage was virtually a repeal of the proceedings of the military tribunal in question. The Duke of Richmond replied with great ability to the various pleas which Lord Sackville had brought forward in his own justification. In particular, he observed, that their lordships were not ignorant, that the noble viscount rested a considerable part of the vindication of his behaviour at the battle of Minden upon the supposed existence of a striking variation in the orders delivered from Prince Ferdinand to the commander of the cavalry. It was understood that the first order was, that the *cavalry* should advance; and the second, that the *British cavalry* should advance. Yet even under these supposed contradictory orders, it was evident that the noble lord ought to have advanced, and, certainly, the distance being short, he enjoyed a sufficient space of time for obedience to his instructions. Lord Southampton, who delivered one of the messages, was now present in the house; and it would seem that he had no choice on this occasion but to acknowledge, either that he did not properly deliver such orders to the noble viscount, or that the latter, having properly received them, neglected to obey them. But whatever difficulties might have arisen during the endeavours to determine exactly how much time had actually been lost in consequence of the non-compliance of Lord Sackville with the orders which he received, he could with much facility have solved what all the witnesses examined as to this point were not able positively to determine. If, summoned as he was to appear upon the trial, his deposition had been called for, he could have proved, because he held all the while his watch in his hand, and seldom ceased to look at it, that the time lost by the noble viscount delaying to advance, under pretence of receiving such contradictory orders as made it impossible for him to discover whether he ought to advance with the *whole* cavalry, or only with the *British* cavalry, was *one hour and a half*. It was therefore extremely evident that the noble lord had had it in his power to bring up the cavalry from the distance of a mile and a quarter; the consequence of which would have been that, by joining in the battle, they might have rendered the victory more brilliant and decisive. But before the arrival of this cavalry, the engagement was concluded. Such was the testimony, said the duke, which, having had the honour to serve at the battle of Minden under Prince Ferdinand of Brunswick, he must have borne, if, being summoned, the members of the court-martial had thought proper to have examined him on the trial. Under such circumstances, the noble viscount could have but little reason to complain of the sentence of the court-martial, of the orders which

Reign of George III.

Reign of George III. followed it, or of the loss of his commission. The motion was powerfully supported by other arguments, both by the Duke of Richmond himself and by other peers; but it was nevertheless rejected by a large majority. A protest was however entered, signed by nine peers, in which the sentence and the public orders were particularly stated; and in which they declared, that they looked upon the raising to the peerage a person so circumstanced as a measure fatal to the interests as well as to the glory of the crown, and to the dignity of the house.

The ruinous tendency of the American war was now so strikingly apparent, that it became necessary for those who had a just sense of the dangerous situation of the country, and wished well to its interests, to exert their most vigorous efforts to put an end to so fatal a contest. Accordingly, on the 22d of February, a motion was made by General Conway, that an humble address should be presented to his majesty, imploring him to take into his consideration the many and great calamities which had attended this unfortunate war, and to listen to the humble prayer and advice of his faithful Commons, that the war on the continent of North America might no longer be pursued for the impracticable purpose of reducing that country to obedience by force. The motion was seconded by Lord John Cavendish, but vigorously opposed by administration, who had still strength sufficient to carry their point, though only by a single vote, the motion being rejected by a hundred and ninety-four to a hundred and ninety-three.

The increasing power of the opposition now showed that the downfall of the ministry was at hand. The decision of the last question was considered as a victory gained by the former, and Mr Fox instantly gave notice that the subject would be resumed in a few days under another form. It was accordingly revived on the 27th of February, when a petition from the city of London was presented, soliciting the house to interpose in such a manner as to prevent any further prosecution of the American war; after which General Conway moved, as a resolution, that it was the opinion of the house that the further prosecution of offensive war on the continent of North America, for the purpose of reducing the revolted colonies to obedience by force, would be the means of weakening the efforts of this country against her European enemies, and would tend to increase the mutual enmity so fatal to the interests both of Great Britain and America. It appears from the journals, said the general, that from the days of Edward III. down to the present reign, parliament has at all times given advice to the crown in matters relating to war and peace. In the reign of Richard II. it was frequently done, and also in that of Henry IV. One remarkable instance of this occurred in the reign of Henry VII. when that prince consulted his parliament respecting the propriety of supporting the Duke of Brittany against France, and also of declaring war against the latter; and when he told his parliament that it was for no other purpose than to hear their advice on these heads that he called them together. In the reign of James I. the parliament interfered repeatedly with their advice respecting the palatinate, the match with Spain, and a declaration of war against that power. In the time of Charles I. there were similar interferences; and in the reign of his son Charles II. the parliament made repeated remonstrances, but particularly in 1674 and 1675, on the subject of the alliance with France, which, they urged, ought to be renounced, and at the same time recommended a strict union with the United Provinces. To some of these remonstrances, indeed, answers were returned not very satisfactory; and the parliament were informed that they were exceeding the line of their duty, and encroaching upon the prerogative of the crown. But so little did the Commons of those

days relish these answers, that they addressed the king to know who it was who had advised his majesty to return such answers to their loyal and constitutional remonstrances. In the reign of King William, repeated instances were to be found in the journals, of advice given by parliament relative to the Irish war and the war on the continent. The same thing occurred frequently in the reign of Queen Anne, who, in an address from the parliament, was advised not to make peace with France until Spain should be secured to Austria, and also not to consent to peace until Dunkirk should be demolished. In short, it was manifest from the whole history of English parliaments, that it was ever considered as constitutional for parliament to interfere, whenever it thought proper, in all matters so important as those of peace and war. Other arguments were urged in support of the motion, which was seconded by Lord Althorp; and petitions from the mayor, burgesses, and commonalty of the city of Bristol, and from the merchants, tradesmen, and inhabitants of that city, against the American war, were also read. But in order to evade coming to any immediate determination on the question, a proposition was made by the attorney-general, that a truce should be entered into with America, and a bill prepared to enable his majesty's ministers to treat on this ground; and under pretence of allowing time for this measure, he moved that the present debate be adjourned for a fortnight. This motion, however, was negatived by a majority of nineteen; and the original motion of General Conway was then put and carried without a division.

The general immediately followed up this victory with a motion for an address to the king, soliciting his majesty to put a stop to any further prosecution of offensive war against the colonies; which was agreed to, and presented to his majesty by the whole house on the 1st of March. On this occasion his majesty answered, that there were no objects nearer to his heart than the happiness and prosperity of his people; that, in pursuance of the advice of the Commons, he should take such measures as might appear conducive to the restoration of harmony between Great Britain and her revolted colonies; and that his efforts should be directed in the most effectual manner against our European enemies, until a peace could be obtained consistent with the interests and permanent welfare of the kingdom. The proceedings of the House of Commons gave general satisfaction; but the royal answer was not thought sufficiently explicit. Accordingly, on the 4th of March, General Conway moved that an humble address be presented to his majesty, to return his majesty the thanks of that house for his gracious answer to their last address; the house being convinced that, in the present circumstances of this country, nothing could so essentially promote those great objects of his majesty's paternal care for his people as the measures which his faithful Commons had most humbly but earnestly recommended to his majesty; and this motion was unanimously agreed to. The general then moved a resolution, that, after the solemn declaration of the opinion of the house, in their humble address presented to his majesty, and his majesty's assurance of his gracious intentions, the house would consider as enemies to his majesty and the country all who should endeavour to frustrate his majesty's paternal care for the happiness of his people, by advising the further prosecution of offensive war on the continent of North America. After some debate this motion was agreed to without a division; and, on the 6th, after a number of papers had been read in the House of Peers relative to the surrender of Earl Cornwallis and the army under his command, the Duke of Chandos moved, first, that, in the opinion of the house, the immediate cause of the capture of the army under Earl Cornwallis in Virginia, was the want of

Reign of George III. of a sufficient naval force to cover and protect the same; and, secondly, that the not covering and protecting of the army under Earl Cornwallis in a proper manner was highly blameable in those who advised and planned the expedition. But after considerable discussion these motions were rejected.

In spite of all these efforts, however, the ministry still kept their ground, and with astonishing resolution combated the force of opposition, which was daily increasing. On the 8th of March several resolutions were moved by Lord John Cavendish; one of which bore that the chief cause of the national misfortunes was the want of foresight and ability in his majesty's ministers; and another respected the immense sum expended on the war, which was alleged to be little less than a hundred millions. But all inquiry was still frustrated, and these motions were lost by a majority of ten. Meanwhile, as the unpopularity of Lord North was further increased by the proposal of some new taxes, particularly on soap, the carriage of goods, and places of entertainment, opposition determined if possible to force him to resign; and on the 15th of March it was moved by Sir John Rous that the nation could have no further confidence in the ministers who had the conduct of public affairs. Lord North endeavoured to vindicate his own administration. He affirmed that it could not be declared with truth that the national calamities originated from the measures of the present administration. The repeal of the American stamp-act, and the passing of the declaratory law, took place before his entrance into office. As a private member of parliament he gave his vote in favour of both, but as a minister he was not responsible for either. When he accepted office the times were scarcely less violent than the present. He approached the helm when others had deserted it; and, standing there, he had used his utmost efforts to assist his country. That the American war was just and requisite, and prosecuted for the purpose of supporting and maintaining the rights of the British legislature, was a position for the truth of which he would ever contend, whilst he enjoyed the power of arguing at all upon the subject. As to peace, he not only wished most earnestly for it, but also for the formation of such a ministry as might at once prove acceptable to the country, and cordially co-operate for the welfare and honour of the state. The house at length divided upon the question, when there appeared a majority of nine in favour of administration.

But notwithstanding this decision, it was well known that the ministry could not stand their ground; and, accordingly, four days after, when a motion similar to that by Sir John Rous was about to be made by the Earl of Surrey, Lord North informed the house that his majesty had come to a full determination to change his ministers; and that, in fact, those persons who had for some time conducted the public affairs were no longer his majesty's ministers. They were not now to be considered as men holding the reins of government and transacting measures of state, but merely as performing their official duty till other ministers were appointed to take their places. In consequence of the declaration of Lord North, the Earl of Surrey agreed to waive his intended motion, and, after some further debate, the house adjourned. And thus an end was put to an administration which had long been obnoxious to a great part of the nation, and whose removal contributed very much to allay those ferments by which every part of the British dominions had been agitated. Peace now became as much the object of ministry as war had been formerly. But before we proceed to any account of the negotiations for that desirable object, it will be necessary to notice the military events which disposed the other belligerent powers to an accommodation.

The ill success of Britain in America has already been taken notice of. The disaster of Cornwallis had produced a sincere desire of peace with America; but this could not be accomplished without making peace with France also; and that power was still haughty and elated with success. Minorca had now fallen into the hands of the Spaniards; and though the capture of a few miserable invalids, attended with such extreme difficulty as the Spaniards had experienced, ought rather to have intimidated them than otherwise, they now projected the most important conquests. Nothing less than the entire reduction of the British West India islands was contemplated by the allies; and indeed there was too much reason to suppose that this object was within their reach. In the beginning of the year 1782 the islands of Nevis and St Christophers were obliged to surrender to Count de Grasse the French admiral, and the Marquis de Bouillé, who had already signalized himself by several exploits; and Jamaica was marked out as the next victim. But the end of all these aspiring hopes was fast approaching. The advantages hitherto gained by the French in their naval engagements with the British fleet had proceeded entirely from their keeping at a great distance during the time of action, and from their good fortune and dexterity in gaining the wind. At last the French admiral De Grasse, prompted by his natural courage, or induced by circumstances, determined, after an indecisive action on the 9th of April 1782, to risk a close engagement with his formidable antagonist, Admiral Rodney. The action was brought on by the count shortening sail to prevent the loss of a disabled ship, by parting with which he might have avoided the disaster that followed. This memorable engagement took place off the island of Dominica, three days after the former. The British fleet consisted of thirty-seven ships of the line, and the French of thirty-four. The engagement commenced at seven o'clock in the morning, and continued with unremitting fury till half past six in the evening. It is said that no other signal was made by the admiral but the general one for action, and that for close combat. Sir George Rodney was on board the *Formidable*, a ship of ninety guns; and the Count de Grasse was on board the *Ville de Paris*, a ship of a hundred and ten guns, which had been presented to the French king by the city of Paris. In the course of the action, the *Formidable* fired nearly eighty broadsides; and for three hours the admiral's ship was involved in so thick a cloud of smoke that it was almost invisible to the officers and men of the rest of the fleet. The van division of the British fleet was commanded by Sir Samuel Hood, and the rear division by Rear-admiral Drake; and both these officers greatly distinguished themselves in the course of the action. But the decisive turn on this memorable day was given by a bold manœuvre of the *Formidable*, which, taking advantage of a favourable shift in the wind, passed through the French line, and threw them into irretrievable confusion. The first French ship that struck was the *Cæsar*, of seventy-four guns, the captain of which fought nobly, and fell in the action. When she struck she had scarcely a foot of canvass without a shot hole. Unfortunately, soon after she was taken possession of, she took fire by accident, and blew up, when about two hundred Frenchmen perished in her, together with an English lieutenant and ten English seamen. The *Glorieux* and the *Hector*, both seventy-four gun ships, were also taken by the British fleet; together with the *Ardent* of sixty-four guns; and a French seventy-four gun ship was also sunk in the engagement. It was almost dark when the *Ville de Paris*, on board of which the Count de Grasse had fought gallantly, struck her colours. Five thousand five hundred troops were on board the French fleet, and the havoc among them was very great, as well as among the

Reign of
George III.

French seamen. The British lost in killed and wounded about a thousand men. Captain Blair, who commanded the *Anson*, and several other officers, were killed in the action; and Lord Robert Manners, who commanded the *Resolution*, died of his wounds on his return home. It was universally allowed that in this engagement the French, notwithstanding their defeat, behaved with the greatest valour. De Grasse himself did not surrender till four hundred of his people were killed, and only the admiral and two others remained without a wound. The captain of the *Cæsar*, after his ensign-staff was shot away, and the ship almost battered to pieces, caused his colours to be nailed to the mast, and thus continued fighting till he was killed. The vessel, when taken, was a mere wreck. Other French officers behaved with equal resolution. The valour of the British requires no encomium; it was proved by their success on this glorious day.¹

This victory was a very fortunate circumstance both for the interest and the reputation of the British admiral. Before this event the new ministry had appointed Admiral Pigot to supersede him in the command in the West Indies; and it was understood that they meant to set on foot a rigid inquiry into the transactions at St Eustatius. But the splendour of this victory put an end to all thoughts of the kind; he received the thanks of both houses of parliament for his services; and he was created an English peer, by the title of Baron Rodney of Rodney Stoke, in the county of Somerset. Sir Samuel Hood was also created Baron Hood of Catherington, in the kingdom of Ireland; and Rear-admiral Drake and Captain Affleck were created baronets of Great Britain. Some attempts were also made, in the House of Commons, to procure a vote of censure against the new ministry for having recalled Lord Rodney; but the motions for this purpose were rejected by a large majority.

Though the designs of the French against Jamaica were now effectually frustrated, the victory was not followed by those beneficial results which many had expected from it; and none of the British islands which had been taken by the French in the West Indies were afterwards recaptured. Some of the ships which had been taken by Admiral Rodney were also lost at sea, particularly the *Ville de Paris*, *Glorieux*, and *Hector*; and a British man of war, the *Centaur*, of seventy-four guns, foundered at sea on the 24th of September 1782. The Jamaica homeward-bound fleet was also dispersed by a hurricane off the banks of Newfoundland, when the *Ramillies* of seventy-four guns and several merchantmen foundered. About this time the British navy sustained a very considerable loss at home, by the *Royal George*, of a hundred guns, being upset and sunk at Portsmouth. This melancholy accident, which happened on the 29th of August, was occasioned by a partial heel given to the ship, in order to cleanse and sweeten her. The guns on one side being removed to the other, or at least the greater part of them, and her lower deck ports not being lashed in, the ship thwarted on the tide with a squall from the north-west, filled with water, and sunk in the space of about three minutes. Admiral Kempenfelt, a number of other officers, and upwards of four hundred seamen and two hun-

dred women, besides children, perished on this occasion. The prosecution of the war was thus attended with disasters and difficulties to all parties. The signal defeat above mentioned not only secured the island of Jamaica against the attempts of the French, but prevented them from entertaining any other project than that of distressing commerce.

In the beginning of May an expedition was undertaken to the remote and inhospitable regions of Hudson's Bay; and though no force existed there capable of making any resistance, a seventy-four gun ship and two thirty-six gun frigates were employed in the service. All the people in that part of the world either fled or surrendered at the first summons. The loss of the Hudson's Bay Company, on this occasion, amounted to £500,000; but the humanity of the French commander was conspicuous, in leaving a sufficient quantity of provisions and stores of all kinds for the use of the British who had fled at his approach. Another expedition was undertaken by the Spaniards to the Bahama Islands, where an equally easy conquest was obtained. The island of Providence, defended only by three hundred and sixty men, could make no resistance when attacked by five thousand. An honourable capitulation was granted by the victors, who likewise treated the garrison with kindness. Some settlements on the Mosquito shore were also taken by the Spaniards; but the Bay-men, assisted by their negroes, bravely retook some of them; and having formed a little army of the Indians in those parts, headed by Colonel Despard, they attacked and carried the posts on the Black River, making prisoners of about eight hundred Spanish troops. The greatest disaster which befel this power, however, was their failure before Gibraltar, which happened in the month of September 1782, and was accompanied with such circumstances of horror and destruction as evinced the absurdity of persisting in the enterprise. Thus all parties felt that it was high time to put an end to the contest. The affair of Cornwallis had shown that it was impossible for Britain to conquer America; the defeat of De Grasse had rendered the reduction of the British possessions in the West Indies impracticable by the French; the final repulse before Gibraltar, and its relief afterwards by the British fleet, put an end to that favourite enterprise, in which almost the whole strength of Spain had been employed; and the engagement of the Dutch with Admiral Parker showed them that nothing could be gained by a naval war with Britain.

The events which led to the removal of Lord North and the other ministers who had so long directed public measures in this kingdom have been already noticed. On this occasion it was said that his majesty expressed considerable agitation of mind at being in a manner compelled to make an entire change in his councils; for the members in opposition would form no coalition with any of the old ministry, the lord chancellor only excepted. On the 30th of March 1782, the Marquis of Rockingham was appointed first lord of the treasury; Lord John Cavendish chancellor of the exchequer; the Earl of Shelburne and Mr Fox principal secretaries of state; Lord Camden president of the council; the Duke of Richmond master of the ordnance; the Duke of Grafton lord privy seal; Ad-

¹ The Count de Grasse, after his defeat, was received on board the *Barfleur* man of war, and afterwards landed on the island of Jamaica, where he was treated with great respect. After continuing there some time, he was conveyed to England, and accommodated with a suite of apartments at the royal hotel in Pall-mall. His sword, which he had delivered up, according to the usual custom, to Admiral Rodney, was returned to him by the king. This etiquette enabled him to appear at court, where he was received by their majesties and the royal family in a manner suitable to his rank. From the time of his arrival in London to his departure, which was on the 12th of August 1782, he was visited by many persons of the first fashion and distinction, and was much employed in paying visits to the great officers of state and some of the principal nobility of the kingdom, by whom he was entertained in a very sumptuous and hospitable style. He received, indeed, every mark of civility which the British nation could bestow; and was treated with much respect even by the common people, from the opinion that was generally entertained of his valour and merit.

Reign of George III. of miral Keppel first lord of the admiralty; General Conway commander in chief of all the forces in Great Britain; Mr Thomas Townshend secretary at war; Mr Burke paymaster of the forces; and Colonel Barré treasurer of the navy. Other offices and honours were likewise conferred on different members of the opposition; and some were raised to the peerage, particularly Admiral Keppel, Sir Fletcher Norton, and Mr Dunning.

The first business in which the new ministry engaged was taking the necessary measures for effecting a general peace. No time, in fact, was lost in the pursuit of this great object; and the empress of Russia, having offered her mediation, in order to restore peace between Great Britain and Holland, Mr Secretary Fox, within two days after his entrance in office, wrote a letter to Simolin, the Russian minister in London, informing him that his majesty was ready to enter into negotiations for peace, on the basis of the treaty of 1674; and that, in order to facilitate such negotiations, he was willing to give immediate orders for a suspension of hostilities, if the States-general were disposed to agree to that measure. But the states of Holland did not appear inclined to enter into a separate peace; nor perhaps would it have been agreeable to the principles of sound policy if they had consented to any propositions of this kind. But immediately after the change of ministry, negotiations for a general peace were commenced at Paris; and Mr Grenville was invested with full powers to treat with all the parties at war, and to propose the independence of the thirteen United Provinces of North America in the first instance, instead of making it a condition of a general treaty. Admiral Digby and General Carleton were also directed to acquaint the American congress with the pacific views of the British court, and with the offer made to acknowledge the independence of the United States.

But before this work of pacification had made any considerable progress, the new ministry sustained an irreparable loss by the death of the Marquis of Rockingham in July 1782. Even before this event, considerable apprehensions were entertained of their want of union; but the death of the nobleman just mentioned occasioned an absolute dissolution. The Earl of Shelburne, who succeeded him as first lord of the treasury, proved so disagreeable to some of his colleagues, that Mr Fox, Lord John Cavendish, Mr Burke, Mr Frederick Montague, and two or three others, instantly resigned. Others, however, though little attached to the earl, continued in their places; and his lordship found means to attach to his interest Mr William Pitt, son to the late Earl of Chatham. Though then in an early stage of life, that gentleman had already distinguished himself greatly in parliament, and was now prevailed upon to accept the office of chancellor. The seceding members of the cabinet were at pains to explain to the house their motives for taking this step, which were in general a suspicion that matters would be managed differently from the plan which they had proposed while in office, and particularly that American independence would not be acknowledged. But this was positively denied at the time, and with truth, as appeared by the event. There appeared, indeed, a duplicity in the conduct of the Earl of Shelburne not easily to be accounted for. Even after it had been intimated by General Carleton and Admiral Digby that the independence of the United Provinces would be conceded by his majesty in the first instance, instead of making it a condition of a provisional treaty, his lordship said, that "he had formerly been, and still was, of opinion, that whenever the independence of America was acknowledged by the British parliament, the sun of England's glory was set for ever." This had been the opinion of Lord Chatham and other able statesmen; nevertheless, as the majority of the cabinet were of a contrary way of thinking, he acquiesced

in the measure, though his ideas were different. He did not wish to see England's sun set for ever, but looked for a spark to be left which might light us up a new day. He wished to God that he had been deputed to congress, that he might plead the cause of America as well as Britain. He was convinced that the liberties of the former were gone as soon as the independence of the states was allowed; and he concluded his speech with observing, that he was not afraid of his expressions being repeated in America, there being great numbers there who were of the same opinion with him, and perceived ruin and independence linked together."

If his lordship really expected that by a flourish of rhetoric he could persuade the Americans to abandon a system for which they had fought so desperately, he greatly overrated his own powers, and mistook the men with whom he had to deal. No obstruction, however, arose to the general pacification. As early as the 30th of November 1782, the articles of a provisional treaty were settled between Britain and America. By these it was stipulated, that the people of the United States should continue to enjoy, without molestation, the right to take fish of every kind on the grand bank, and on all the other banks of Newfoundland; and that they should continue to exercise the same privilege in the Gulf of St Lawrence, and at every other place in the sea where the inhabitants used heretofore to fish. They were likewise to have the liberty to take fish of every kind on such parts of the coast of Newfoundland as British seamen resort to, but not to cure or dry them on that island. They were to enjoy the privilege of fishing on the coasts, bays, and creeks of the other dominions of his Britannic majesty in America; and the American fishermen were permitted to cure and dry fish in any of the unsettled bays, harbours, and creeks of Nova Scotia, Magdalen Islands, and Labrador. But it was agreed that, after such places should be settled, this right could not be legally put in practice without the consent of the inhabitants and proprietors of the ground. It was arranged that creditors upon either side should meet with no impediment in the prosecution of their claims; that the congress should earnestly recommend it to the legislatures of the respective states, to provide for the restitution of all estates and properties which had been confiscated belonging to real British subjects, and of the estates and properties of persons resident in districts in the possession of his majesty's arms, and who had not borne arms against the United States; that persons of any other description should have free liberty to go to any part whatsoever of any of the thirteen United States, and remain in it for twelve months unmolested in their endeavours to recover such of their estates, rights, and properties, as might not have been confiscated; that the congress should earnestly recommend to the several states a revision of all acts or laws regarding the premises, so as to render them perfectly consistent, not only with justice and equity, but with that spirit of conciliation which, on the return of the blessing of peace, should universally prevail; that no future confiscations should be made, nor prosecutions commenced against any person, or body of men, on account of the part which he or they had taken in the war; that those who might be in confinement on account of such a charge at the time of the ratification of the treaty in America should be immediately set at liberty; that all hostilities by sea and land should immediately cease; that prisoners on both sides should be set at liberty; that his Britannic majesty should expeditiously, and without committing destruction of any sort, withdraw all his armies, garrisons, and fleets, from every port, place, and harbour, of the United States; that the navigation of the river Mississippi, from its source to the ocean, should remain for ever free

Reign of George III.

Reign of
George III.

and open to the subjects of Great Britain and the citizens of the United States; and, finally, that if any place or territory belonging to Great Britain or to the United States should be conquered by the arms of either before the arrival of the provisional articles in America, it should be restored without compensation or difficulty.

In the treaty between Great Britain and France it was agreed that Newfoundland should remain with England, as before the war; and, to prevent disputes about boundaries, it was arranged that the French fishery should commence at Cape St John on the eastern side, and, sweeping round by the north, should have for its boundary Cape Ray on the western side. The islands of St Pierre and Miquelon, which had been taken in September 1778, were ceded in full right to France. Great Britain was to restore to France the island of St Lucia, and to cede and guarantee to her that of Tobago; and France was to surrender to Great Britain the islands of Grenada and the Grenadines, St Vincent, Dominica, St Christophers, Nevis, and Montserrat. The river Senegal and its dependencies were to be given to France; and the island of Goree was also to be restored. Fort James and the river Gambia were guaranteed to his Britannic majesty; and the gum trade was to remain in the same condition as before the commencement of hostilities. The king of Great Britain was to restore to his most Christian majesty all the establishments which belonged to him at the breaking out of the war on the coast of Orixá and in Bengal; and became bound to secure to the subjects of France in that part of India, and on the coasts of Orixá, Coromandel, and Malabar, a safe, free, and independent trade, either as individuals, or under the direction of a company. Pondicherry, as well as Karikal, was to be restored to France; the two districts of Valanour and Bahour, round Pondicherry, and the four contiguous Magans round Karikal, were also to be given up; and the French were again to enter into the possession of Mahe, and of the comptoir at Surat. The allies of France and Great Britain were to be invited to accede to the present pacification; and in the event of their disinclination, no assistance on either side was to be given to them. Great Britain renounced all claims to Dunkirk. Commissioners were to be respectively appointed by both nations to inquire into the state of commerce, and to concert new arrangements of trade on the footing of mutual convenience. And all conquests on either side, in any part of the world whatsoever, not mentioned nor alluded to in the treaty, were to be restored without difficulty, and without requiring compensation. The prisoners on each side were also to be released without ransom, upon the ratification of the treaty, and on paying the debts which they might have contracted during their captivity; and each crown was respectively to reimburse the sums which had been advanced for the maintenance of their prisoners, by the country where they had been detained, according to attested and authentic vouchers. These preliminary articles of peace were concluded at Versailles on the 20th of January 1783, between Mr Alleyne Fitzherbert, minister plenipotentiary on the part of his Britannic majesty, and Charles Gravier, Comte de Vergennes, the minister plenipotentiary on the part of the king of France.

At the same time preliminary articles of peace between Great Britain and Spain were also concluded at Versailles between Mr Fitzherbert and the Conde d'Aranda, the minister plenipotentiary of the Spanish monarch. His Catholic majesty was to continue in possession of the island of Minorca, and to retain West Florida; whilst East Florida was to be ceded to him by the king of Great Britain. Eighteen months from the ratification of the definitive treaty were to be allowed to the subjects of Britain

who had settled in the island of Minorca and in the two Floridas, to sell their estates, recover their debts, and transport their persons and effects, without being restrained upon account of their religion, or on any other pretence whatsoever, except that of debts and prosecutions for crimes. The liberty of cutting logwood, in a district of which the boundaries were to be ascertained, without molestation or disturbance of any kind whatsoever, was granted to Great Britain. The king of Spain was to restore the islands of Providence and the Bahamas, in the condition in which they were when conquered by his arms. And all other conquests of territories and countries upon either side, not included in the present articles, were also to be mutually restored without difficulty or compensation.

But no sooner were these articles ratified and laid before parliament, than they excited the most vehement declamations against ministry. Never had the administration of Lord North himself been arraigned with more asperity of language. The ministry defended themselves with resolution, but found it impossible to avoid the censure of parliament. An address without any amendment was indeed carried in the House of Lords by a considerable majority; but it was lost in the lower house. On the 21st of February some resolutions were moved in the House of Commons by Lord George Cavendish, of which the most remarkable were, that the concessions made by Britain were greater than its adversaries had a right to expect; and that the house would take the case of the American loyalists into consideration. The last motion indeed his lordship consented to waive, but the rest were carried against ministry.

These proceedings, however, made no alteration with regard to the treaty, which had already been ratified by all the contending powers, the Dutch only excepted. The terms offered the latter were a renewal of the treaty of 1674; which, though highly advantageous, they at that time positively declined. They afterwards, however, made an offer to accept the terms which they had formerly rejected; but the compliment was then returned by a refusal on the part of Britain. When the preliminary articles had been settled with the courts of France and Spain, a suspension of arms with Holland ensued; but though the definitive arrangements with the other powers were finally concluded by the month of September, it was not till then that the preliminary articles were settled with Holland. The terms were a general restitution of all places taken on both sides during the war, excepting only the settlement of Negapatnam in the East Indies, which was to remain in the hands of Britain, unless an equivalent should be given on the part of Holland. The navigation of the eastern seas was to remain free and unmolested to all British shipping. The remaining articles concerned only the exchange of prisoners, and such other matters as are common to all treaties.

Thus an end was put to the most dangerous war in which Britain had ever engaged, and out of which, notwithstanding the powerful combination against her, she came superior to all her enemies. The politicians who had imagined that the prosperity of Britain depended in a great measure on her colonies were singularly mistaken. This was shown at the time, and has been completely confirmed by subsequent experience. For a number of years she had not only been deprived of these colonies, but opposed by them with all their force; yet though attacked at the same time by three of the greatest powers in Europe, and looked upon with an invidious eye by all the rest, the damage done to her enemies still greatly exceeded that which she had received. Their trade by sea was almost ruined; and on comparing the loss of ships on both sides, the balance in favour of Britain was twenty-eight ships of the line and thirty-seven frigates, carrying in all near two thousand

Reign of
George III.

guns. Notwithstanding this, however, the state of the nation appears to have been really such that a much longer continuance of the war would have been impracticable.

Having thus given as full an account as our limits admit of the great national events till the conclusion of the peace in 1783, we shall now advert to some others, which, though of sufficient importance to deserve notice, could not be previously introduced without interrupting the narrative. On the 8th of December 1776 a fire broke out in the rope-house of the dock-yard at Portsmouth, which totally consumed it, but without doing any very material damage. For some time the affair passed as an accident; but in clearing away the rubbish a tin-box was found with a wooden bottom, containing matches which had been lighted, and underneath was a vessel filled with spirits of wine. The fire, however, not having been properly supplied with air, had gone out of itself before it touched the spirits of wine; for if it had caught fire, all the stores in the storehouse, sufficient to fit out fifty sail of the line, would have been destroyed. In the beginning of the year 1777 a fire happened at Bristol, which consumed six or seven warehouses; and by the discovery of machines similar to those already mentioned, it was evident that the fire had not been accidental. The terror of the public was now greatly increased, and violent mutual accusations were thrown out by the ministerial and popular parties. On this point, however, they soon came to a right understanding, by the discovery of the author of all this mischief.

This was one James Aitken, otherwise called John the Painter, a native of Edinburgh. Having from his early years been accustomed to a vagrant life, to which indeed his profession naturally led him, he had gone through a variety of adventures. He had enlisted as a soldier, deserted, and, when pinched by want, made no scruple of betaking himself to the highway, or of committing thefts. Having traversed a great part of America, he had there imbibed to such a degree the prejudices against Britain, that he at last took the extraordinary resolution of singly overturning the whole power of the nation; an achievement which he was to accomplish by setting fire to the dockyards at Portsmouth and Plymouth, and afterwards to the principal trading towns of the kingdom. With this view he carefully inspected the docks and other places on which his attempts were to be made, in order to ascertain in what manner they were guarded, which he found in general as negligent as he could desire: and had there not been some deficiency in the construction of his machines, he must have done incredible mischief; for as his attempts were always detected by the discovery of his machines, it is evident that he had met with abundance of opportunities. For some time the affair at Portsmouth, as has already been mentioned, passed for an accident. It was soon recollected, however, that a person had been seen loitering about the rope-house, and had even been locked up a night in it; that he had worked as a painter, and taken frequent opportunities of getting into that house, and other buildings in the yard. These circumstances exciting a suspicion that he was the incendiary, he was traced to different places, and at last found in a prison, to which he had been committed on a charge of burglary. On his examination, however, he behaved with an assurance and apparent consciousness of innocence which almost disconcerted those who were appointed to examine him; but at last he was deceived into a confession by another painter, a native of America, who pretended to compassionate his case. Evidence was thus procured against him, but he still maintained his character to the last, rejecting and invalidating the testimony of his perfidious friend, on account of his baseness and treachery. He received his sentence with great fortitude, but at length confessed his guilt, and left

some directions for preventing the dock-yards and magazines from being exposed to similar danger in future. Thus it appeared that the whole of the alarm of treason and American incendiaries was occasioned by the political enthusiasm of a wretched vagabond, who chose to stake his life on the wild venture we have described.

Still, however, it appeared that the French court were very well acquainted with many particulars relating to the state of this kingdom, and the movements of our squadrons, which ought by all means to have been kept secret. These treacherous communications were first detected in the month of June 1780. One Ratcliffe, master of a cutter, disclosed that he had been hired by a fellow called Roger to carry packets to France, for which he was to be paid L.20 each time, and to have L.100 besides at a certain period; but apprehending that he might incur some danger by continuing this employment, he gave information of what was going on to one Mr Steward, a merchant at Sandwich, by whom his last packet was carried to the secretary of state. After being opened and sealed up again, it was returned, and he was directed to carry it to France as formerly. Several succeeding packets were treated in the same fashion, though it was some time before Ratcliffe saw the principal party concerned; but this was at last accomplished by his complaining to Roger that he had not been paid the L.100 according to promise. A meeting having been procured, it was found that the person who furnished intelligence to the enemy was one M. Henri de la Motte, a French gentleman then residing in London. On searching his house, no papers of any consequence were found; but being absent when the messengers first arrived, he, on his return, threw some out of his pockets, unperceived, as he thought, by any body. The papers, however, were taken up by the messengers, and gave plain indications not only of a treasonable correspondence with the enemy, but also of his being connected with one Henry Lutterloch, a German, who then resided at Wickham near Portsmouth. This person being also apprehended, not only made a full disclosure of the treasonable correspondence with France, but gave abundant proofs of being himself one of the most depraved of mankind, and lost to every feeling excepting the desire of accumulating wealth. His evidence, however, and other strong circumstances, were sufficient to convict M. de la Motte, who was accordingly executed, though the king remitted the more dreadful part of his sentence. During his trial, and on every other occasion, he behaved in such a manner as showed him to be an accomplished gentleman, and not only excited the compassion, but the admiration, of every one who saw him.

During the whole course of the war, only one other person was detected in any act of treason; and he appears to have been actuated merely by mercenary motives. This was a man called David Tyrie, a native of Edinburgh. Having been bred in the mercantile line, and engaged in a number of speculations with a view to gain money, in all of which he had discovered considerable abilities, he at last engaged in the more dangerous one of conveying intelligence to the French, of the ships of war fitted out in Britain, the time of their sailing, and other particulars. For this he was apprehended in the month of February 1782. The discovery was made by means of one Mrs Askew, who passed for Tyrie's wife. This person having delivered a bundle of papers in a hurry to a school-mistress, desired her not to show them to any one; the latter, however, not only inspected them herself, but showed them to another, by whom they were sent to the secretary at war. By this, and another packet discovered by William James, who had been employed to carry it to France, Tyrie was convicted of treasonable correspondence with the enemy, and executed in the month of August 1782.

Reign of
George III.

On the whole, it appears that notwithstanding the excessive virulence of parties, which even proceeded so far as to produce duels between some members of parliament, neither entertained any designs against what was believed to be the true interest of the nation. The one seems to have regarded its honour too much, and to have been inclined to sacrifice even its existence to that favourite notion; the other perhaps regarded the national honour too little; nor indeed could an advantageous idea have been formed of the spirit of the nation which should have submitted to the dismemberment of its empire without a struggle. The event, however, has shown, that the loss of the colonies, so far from being a disadvantage, has been the very reverse. The commerce of Britain, instead of being dependent on America, has arrived at a much greater height than ever; whilst the consequent increase of wealth has enabled the nation to support that enormous debt, part of which was contracted, first in defending, and then in attempting to conquer, the colonies.

the Ministry.—The Prince's Correspondence.—Regency Bill passed.—Recovery of the King.—Conduct of the Irish Parliament respecting the Regency.—The Slave Trade.—Mr Wilberforce's Propositions.—Jesuitical Support of Mr Pitt.—Mr Addington chosen Speaker of the House of Commons.—New Taxes.—Extension of the Excise Laws.—Proposed Repeal of Religious Tests and Penal Statutes.—Indian Affairs.—Trial of Mr Hastings.—Affair of Nundcomar.

It has been already remarked, that in the debates in the House of Commons upon the treaties concluded under Lord Shelburne's administration, by which the American war was brought to a close, the terms of those treaties were disapproved of by the majority of the house; and this disapprobation was expressed by carrying an amendment to the ministerial motion for an address of thanks to his majesty. It does not appear, however, that the nation at large disapproved of the conditions of the peace. All ranks of men had long been weary of the war with the colonies, and desirous to relinquish every claim of sovereignty over them; and this point being decided, other objects of negotiation were of too little importance to excite any great degree of public interest. The majority which now voted against administration consisted of men brought together by views little connected with the accomplishment of any patriotic object, and in a manner which well merits the attention of the historian.

The death of the Marquis of Rockingham left in a very disjointed state the party which had opposed the American war. Lord Shelburne's administration appears to have been formed under the influence of the crown alone, to the exclusion of Lord North and his friends, as well as of Mr Fox and the other principal members of the former opposition. Thus an attempt appears to have been made to govern the kingdom without supporting the royal prerogative by the strength of any political party. An event, however, occurred of a nature undoubtedly not a little dangerous to the constitution; but being new in itself, it seems not to have been foreseen by speculative writers upon the British government.

The American war had been conducted with a profusion of expense totally unexampled in former contests. The service of government became of itself an immense object of trade, an employment in which thousands of all kinds of artists, manufacturers, and merchants, engaged; and hence the patronage enjoyed by the minister for the time was proportionally extensive. The natural consequence was, that he and his friends, with a long train of their friends and dependents, were enabled to accumulate great wealth, and rise to the enjoyment of influence in all parts of the country. The impracticability of accomplishing the great object of the war at last led to its termination; and the minister who had been unsuccessful in conducting it was dismissed, as had usually been done upon such occasions in Britain, to make way for his antagonists, who had long recommended, and who could, therefore, with a better grace adopt, measures of pacification. But the dismissal of the minister and his friends from their official situations did not at once destroy their political importance in the state. They constituted a very formidable body of men in both houses of parliament; and such was the influence which the possession of power had conferred upon Lord North, that to the latest period of his life he was understood to be able to carry along with him, at all times, upwards of forty votes in the House of Commons; a power which was evidently too dangerous to belong to a subject of a free state, and so indeed it proved by the event to be.

Mr Fox, and the other statesmen who had led the opposition to Lord North's measures during the American war, but who had retired from administration on the accession of Lord Shelburne to the treasury after the death

Reign of
Geo. III. of the Marquis of Rockingham, appear to have at last become weary of an unprofitable opposition, and desirous upon almost any terms of entering into the enjoyment of power. But their party, though possessing very great talents, was too weak in point of numbers to be able to contend against the minister of the day, supported by the whole patronage of the crown. On the other hand, though Lord North and his friends formed in both houses of parliament a very formidable phalanx, still they also were too few to contend against ministerial influence, and the party usually called the "king's friends;" while from the natural course of things they might also expect that their numbers would gradually diminish. They had risen by attaching themselves to the service of the state; and the changes which mortality produces would by degrees enable the existing government to supplant them by a new race of ambitious men. In this state of matters the two opposition parties, led by Lord North and Mr Fox, thought fit to come to an agreement to unite their strength, and thus, by forming a complete majority in parliament, to impose themselves upon the sovereign as his ministers. In this way the majority was produced which opposed Lord Shelburne's administration, and it has since been known under the appellation of the Coalition.

The effect produced upon the public mind by this coalition was extremely important; and it is probable that even yet its consequences are not fully understood. In almost any other country than Britain, and indeed at many former periods of our history, such a combination of powerful men, possessing a predominance in the legislature, could not have failed to prove fatal to the constitution, and destructive of the internal tranquillity of the state. If the king gave way to such an aristocratical combination, and received its leaders into his service, it was to be feared that the whole patronage of the crown, together with the authority of the royal name, and the majority which they already possessed in the other branches of the legislature, might enable them to fortify themselves by new institutions and laws, and render them independent both of the king and people. No hope appeared from a dissolution of parliament, as the public at large were not at once aware of the critical situation to which the constitution had been brought by the Coalition; and a prince of a rash character would, in such circumstances, perhaps have seen no other resource for the protection of his prerogative, than to attempt to govern without a parliament, the majority of which were evidently acting, not the part of dutiful subjects or faithful representatives of the people, but of individuals conspiring to seize, for their own private advantage, the emoluments and authority of office. This judgment will not probably be regarded as too severe, when it is considered, that at the period in question there existed no pretext for opposition to the crown founded upon any complaint of the nation against the abuse of its prerogatives; and that the individuals who now coalesced could not have been induced to do so upon any pretence of political principle. Lord North, the steady assertor and supporter of the royal prerogative, and the conductor of the American war, now joined Mr Fox, the opponent of that war, and the eloquent champion of the privileges of the people; and neither of these men, nor their friends, ever pretended that they had relinquished their former opinions. The purpose of the present coalition was therefore notorious; whilst the outrageous abuse with which they had formerly treated each other served only to afford a new example how completely ambition is capable of subduing every resentment, and all the ordinary passions of the human mind.

The party now called the Coalition had displayed the superiority of their numbers in the House of Commons in

the debates upon the treaty of peace in the middle of February. From that period it was considered as obvious that a new administration must be formed; and hence from that time public business remained at a stand, and the nation was kept in suspense. The period was critical, on account of the termination of the war, at which great bodies of troops and seamen were to be discharged, and many pecuniary arrears paid off. The different regiments of militia were also disembodied, and sailors and soldiers dismissed in a state of turbulence, natural to men accustomed to arms, and whose pay had not been regularly paid. These and other circumstances, joined with the unsettled state of the government, produced various disorderly proceedings at Portsmouth, Plymouth, and other places. In the mean time, a loan could not be negotiated by the ministry whilst they wanted the countenance of the House of Commons. During the whole month of March, however, they still lingered in their places, and a variety of negotiations were carried on by the court for the purpose of attempting to form a new ministry, without an unconditional transfer of the government of the kingdom to the Coalition. Confident of their own strength, however, this political combination were desirous of attaining power upon their own terms, and continued to display their superiority in the House of Commons, with a view to compel their own reception at court. On the 24th of March, on the motion of Mr T. W. Coke, seconded by Lord Surrey, an address was agreed to, requesting his majesty to take into consideration the distracted state of the empire after an exhausting war, and to comply with the wishes of the house, by forming an administration entitled to the confidence of his people. His majesty answered, that it was his earnest desire to do every thing in his power to comply with the wishes of his faithful Commons. The delay, however, continued; and all descriptions of men were involved in doubt, suspense, and anxiety. On the 31st of the same month, a new address, moved by Lord Surrey, was agreed to, urging in very earnest terms the formation of what was called an efficient and responsible administration, formed upon principles of strength and stability, and suited to the actual state of his majesty's affairs both at home and abroad. And at last, on the 2d of April, his majesty, yielding to what appeared as necessity, appointed an administration consisting of the leaders of the Coalition.

The Duke of Portland was promoted to be first lord of the treasury; Lord North and Mr Fox were appointed principal secretaries of state; Lord John Cavendish was made chancellor of the exchequer; Lord Keppel was placed at the head of the admiralty; Lord Stormont was created president of the council; and the Earl of Carlisle was advanced to be keeper of the privy seal. These constituted the cabinet; and the other offices of government were filled by the supporters and friends of ministers. The right honourable Charles Townshend was appointed treasurer of the navy, Mr Burke paymaster general of the forces, and Lord Viscount Townshend master-general of the ordnance. The seals were put in commission, at the head of which was Lord Loughborough. The right honourable Richard Fitzpatrick was appointed secretary at war; James Wallace, Esq. was made attorney-general; John Lee, Esq. became solicitor-general; the Earl of Northington was appointed lord-lieutenant of Ireland; and, in Scotland, the honourable Henry Erskine was made lord-advocate, in the room of Mr Henry Dundas. But the new administration was no sooner installed, than an opposition was formed, which, in the House of Lords, was led by the Duke of Richmond and Lord Thurlow; and in the House of Commons by Mr Pitt, and Mr Jenkinson, afterwards created successively Lord Hawkesbury and Earl of Liverpool.

The Coalition administration, on entering into office,

Reign of
George III.

Reign of
George III.

were under the necessity of instantly negotiating a loan of twelve millions, to supply the necessities of the state; and to provide for the interest of this loan various taxes were proposed by Lord John Cavendish, the chancellor of the exchequer. These were imposed on bills of exchange, receipts, probates of wills and legacies, bonds, and law proceedings, stage coaches, quack medicines, carriages, letters-patent, and other articles; whilst registers of births, marriages, and deaths, were also taxed. These taxes gave rise to debates which produced little interest. But the case was otherwise with regard to another subject in which Mr Pitt took the lead.

Towards the close of the American war, when want of success had begun to render it unpopular, it had been repeatedly urged, both in parliament and in various publications, that the ministerial majorities in favour of the measures pursued against the colonies would never have existed if the people of this country had been fairly represented in the House of Commons. By degrees this sentiment attracted attention; and to give countenance to parliamentary reform came to be regarded as a sure step towards the attainment of popular favour. Accordingly, Mr Pitt, then a young man, endeavoured to recommend himself to notice, by engaging eagerly in the pursuit of this object. He opened the subject in the House of Commons on the 7th of May, in an eloquent speech, in which, after declaring his admiration of the general fabric of the British constitution, and affirming that he wished not to alter but to restore its true spirit, which time and changes, accident and events, had enfeebled and diminished, he asserted that the state of parliamentary representation was partial and inadequate, and the progress of undue influence alarming and ominous; that the true spirit of liberty had decayed, and that the powers of control, in different branches of the government, were greatly debilitated; that wild speculations of reform were afloat without doors; but that the measures he was about to propose were equally moderate and necessary. He stated his plan of reform to be,—first, that measures ought to be taken to prevent bribery and expense at elections; secondly, that for the future, when the majority of voters of any borough should be convicted of notorious corruption, the borough should be disfranchised, and the minority of voters not so convicted should be entitled to vote for the county in which the borough might be situated; thirdly, that an addition ought to be made to the representation, to consist of knights of the shire, and of representatives of the metropolis. Mr Pitt was opposed with much earnestness by Lords North and Mulgrave, and also by Mr Powis. He was supported, however, by Mr Fox and Mr Beaufoy, and also by Mr Thomas Pitt, who offered, as a testimony of his sincerity, to make a voluntary sacrifice of his borough of Old Sarum. Mr Henry Dundas, who now attached himself to Mr Pitt, supported on this occasion the motion of his friend, and asserted, that to comply with the wishes of the people would be the happiest means of putting an end to their complaints. Mr Pitt's resolutions, however, were lost by a very large majority.

During the same session the new administration brought forward a bill, admitting in express terms the exclusive rights and absolute supremacy of the parliament and courts of Ireland in matters of legislation and judicature, and preventing any writs of error or appeal from the courts of that country to the courts of Great Britain. The bill passed with little opposition, and tended to gratify the people of Ireland, though, by increasing the line of separation between the countries, it evidently placed them in greater hazard of disunion.

During the present session Mr Dundas obtained leave to bring into parliament a bill for regulating the affairs of

India. The chief feature of his plan consisted in subjecting the presidencies of Madras and Bombay to a controlling jurisdiction, to be conferred on the government of Bengal, which he wished to vest in the person of a governor, entitled to act when he thought fit, in opposition to the opinion of his council. Another object of this bill was to secure to the native proprietors their estates in perpetuity, on payment of a fixed tribute, and to extend these provisions to the nabob of Arcot and the rajah of Tanjore. Mr Dundas contended that such a measure was rendered necessary in consequence of the improper conduct and tyranny of the servants of the East India Company, and especially of their principal servant Mr Hastings, whom he proposed to recall, and to send out to India Lord Cornwallis, as governor-general, in his stead. The scheme, however, proved abortive; but it led to other legislative efforts on the same subject.

Though Mr Pitt had been unsuccessful in his proposal to reform the representation of the people in parliament, he immediately brought forward a bill containing a project for an inferior species of reform, respecting the fees, gratuities, and perquisites in the different departments of the public offices. The object of this bill being economy, it passed through the House of Commons, but was rejected in the House of Lords.

Towards the close of the session, a petition from the American loyalists was, by his majesty's command, presented to the House of Commons by Lord John Cavendish. It stated that the petitioners, some of whom were persons of the first character, fortune, and consideration, having adhered to Great Britain during the contest with the colonies, had been attainted in North America as traitors, and their effects confiscated by the legislatures of the different states. Many of the petitioners were widows and orphans, who had lost husbands and fathers by their adherence to the British cause; whilst others were military and civil officers, clergy and other professional men, who had lost their means of subsistence in the same manner. They prayed the House of Commons to grant them such relief as might seem adequate to their situation; and, on the motion of the chancellor of the exchequer, an act was accordingly passed, appointing commissioners to inquire into the circumstances of such persons as were reduced to distress by the late dissensions in America.

On the 23d of June his majesty, by a message, requested the aid of parliament in making a separate establishment for the Prince of Wales. Sixty thousand pounds only were demanded for this purpose; and it was stated by Lord John Cavendish, that his majesty intended to allow the prince L.50,000 a year out of the civil list, without requiring from the public any further assistance than the above sum of L.60,000, which would be requisite to defray the extraordinary expense attending a new establishment. This last sum was the more readily granted, because rumours had gone abroad, which were alluded to by Mr Pitt in the House of Commons, that an intention had existed on the part of the administration, particularly of Mr Fox, to give the prince a very splendid establishment at the public expense, but that this proposal had not proved acceptable to his majesty. Mr Fox said, that he undoubtedly considered the proposed establishment as much too low; and that if it had remained with him to have advised an establishment, he would most assuredly have proposed a sum more adequate to the object in view. The person, however, most proper to decide in the business had been of an opinion very different, and it was his duty to submit.

Parliament was soon afterwards prorogued. The nation was now in a state of perfect tranquillity. Some anxiety,

Reign of George III. however, existed in the minds of men with regard to the public welfare. The load of public debt which had been incurred seemed excessive; and though commerce began to flow into new and extensive channels, the returns of trade necessarily required some time to exhibit themselves in the form of a flourishing revenue. In the interval, therefore, between the period at which the ministerial expenditure for the support of the war ceased, and that at which the first profits of foreign trade were received, a considerable shortcoming took place in the public revenue, and individuals experienced many difficulties. These, however, gradually passed away; and two inventions were by degrees brought to perfection, which of themselves secured a profit to the public, almost equivalent to the burdens which it had incurred in consequence of the American war. These were the machine for spinning cotton, the invention of a man, originally of low station, Richard Arkwright; and the very valuable kinds of pottery contrived by Mr Wedgwood. The first of these, by producing at a cheap rate the most beautiful cotton fabrics, in a great measure put an end to the use of silk, and gave to the British manufacturers a kind of monopoly of many of the most useful articles of clothing; whilst the other not only drew to the nation immense sums from foreign countries, but, from the bulky nature of the commodity, employed an immense tonnage of shipping in its exportation.

In the mean time people had leisure to reflect upon the nature of the coalition of political parties which had recently taken place. The tendency of that measure, and the possible evils which might result from it, did not at once present themselves to the minds of men, because it was not known to the public at large that the sovereign had felt his own independence affected by the event. The general sentiment, however, was that of indignation against the political parties, who had so far forgotten all the principles which they had long and loudly professed, as to be capable of uniting with each other for the sake of power and emolument. It was universally said that no honesty was to be found among political men, and that no profession of patriotism ought henceforth to be trusted. Thus a severe wound was inflicted upon the public morals of the nation, by the want of consistency which its most conspicuous characters had exhibited; and the wound was only the deeper from the apparent strength of administration, which included in itself the men of greatest political influence in the kingdom, who were considered as likely to retain long the power which they now possessed.

In this state of affairs parliament assembled on the 11th of November. In the speech from the throne, the necessity of providing for the security of the revenue, and of attending to the situation of the East India Company, were stated to both houses, as apologies for calling them together after so short a recess. Some days passed in discussions relative to different parts of the revenue, when Mr Secretary Fox moved for leave to bring in two bills relative to the affairs of the East India Company. By the first of these, it was proposed to take from the East India Company the whole administration of their territorial and commercial affairs, and to vest it in seven directors, named in the bill, viz. Earl Fitzwilliam, the Right Honourable Frederick Montague, Lord Viscount Levisham, the Honourable George Augustus North, Sir Gilbert Elliot, Sir Henry Fletcher, and Robert Gregory, Esq. These directors, or commissioners, were to hold their office during four years, and not to be removable by his majesty, without an address from either house of parliament; and they were to be aided by a board composed of nine assistant directors, who were to be removable by five of the principal directors, and were to have full authority over all the company's servants and affairs, civil as well as military. The

second bill, which accompanied the first in all its stages, was intended to regulate the administration of affairs in India. It forbade the exchange, acquisition, or invasion of any territory in India, by the general council, or any presidency there. It abolished all monopolies in India, and prohibited the acceptance of presents, making them recoverable by any person for his sole benefit. It secured an estate of inheritance to the native landholders, and provided against the alteration or increase of rents. It prohibited the molestation of princes subject to the Company, and restrained the Company's servants from collecting or farming their revenues, or having any pecuniary transactions with them. It prescribed a mode for adjusting the disputes between the nabob of Arcot and the rajah of Tanjore, and also between them and their British creditors. It disqualified the agents of the Company, or of any protected Indian prince, from sitting in the British House of Commons; and directed all offences against the act to be prosecuted in the courts of India or in the Court of King's Bench.

The East India Company's affairs had hitherto been governed, in terms of the charter of the Company, by a court of proprietors, and a court of directors elected by the proprietors. The rights of these courts, however, were to be absolutely taken away; and their whole powers, or the sovereignty of British India, was to be vested during four years certain in the hands of seven individuals, nominated by the present administration, through the medium of their parliamentary majority. It was undoubtedly a bold measure, openly to assault the privileges of such a body of men as the East India Company; but it was still more new and singular under the British constitution, in the form in which it had existed for more than a century, to vest a large portion of the executive power, including the command of armies, and an immense pecuniary patronage, in the hands of a few individuals, who were to hold their places for a fixed period, independently of the will of the crown. By taking possession in this manner of the patronage of Hindustan, the present administration would have found means to render themselves for a certain time avowedly independent of their sovereign, and they would not have failed to renew their own powers at the end of that period. It is to be observed, however, that the administration had in some degree been led by circumstances which previously occurred, and which did not originate with them, to adopt some decisive measures for reducing India under better management than that in which it had been placed by the East India Company; and of these it will not be improper here to take a short review.

The circumstance of a great and wealthy empire having been vanquished by a company of merchants, was a thing so new in the history of the world that it could not fail to be attended with a variety of inconveniences. The European nations have a near resemblance to each other in laws, manners, arts, and religion; and the mutual jealousy which for some centuries they had been accustomed to entertain of each other had prevented any of them from making great conquests. When any power, therefore, happened to acquire a portion of territory, this addition was never very great; and the laws of the neighbouring states being nearly alike, the conquered province scarcely experienced any misfortune from a change of masters. Hence the evils attending upon great conquests had ceased to be known among the nations of Europe; and the conquerors and the conquered being in all cases men of similar characters and talents, easily mingled with each other. The nobles of Alsace were as well received at the court of France as those belonging to the ancient dominions of the French crown; and the natives of the Netherlands regarded with

Reign of George III.

Reign of
George III.

much indifference their transition from the dominion of Spain to that of Austria and of France. But when the British made conquests in Hindustan, all the evils occurred which naturally attend the loss of national independence, and that most wretched of all states of human affairs, in which a race of strangers enjoys permanent dominion, whilst the natives of a country are subjected to hopeless depression and slavery. The British invaders of India undoubtedly possessed, or speedily acquired, the same rapacity with other conquerors; and as they were the servants of a company of merchants whose only principle of exertion was profit, it is probable that under them avarice and extortion assumed more vexatious forms, because accompanied with greater assiduity, and a more persevering temper, than were exhibited by the former conquerors of that country, who issued from the deserts of Tartary and Arabia. The people of Great Britain, accustomed at home to the mildest government, and to the most equitable administration of justice that the world ever experienced, heard with horror of the crimes, robberies, perfidies, and massacres which their countrymen had committed, and by which the national name and character had been rendered odious in the East. The British government, also, being no party to these crimes, wished to see them repressed, and very naturally supposed that the best remedy would consist in taking India under its own immediate management. Some public-spirited individuals, indeed, dreaded the accession of influence which the crown would thus necessarily acquire; but men of humanity were willing to encounter considerable hazard, for the sake of altering the unjustifiable mode of management which had prevailed in the East.

Early in 1781, two committees were appointed by the House of Commons, to inquire into the mal-administration of the East India Company's affairs both at home and abroad; and all parties in the house concurred in the appointment. The first, or select committee, conducted by some of the most distinguished members of opposition, was directed to inquire into the state of the administration of justice in the provinces of Bengal, Bahar, and Orlissa, and consider how the British possessions in the East Indies might be governed with most advantage to this country, and with the greatest happiness to the natives. The second, or secret committee, under the management of persons in the confidence of administration, was directed to inquire into the causes of the war in the Carnatic, and the condition of the British possessions in those parts.

On the 9th of April 1782, Mr Henry Dundas, lord-advocate of Scotland, and chairman of the secret committee, moved that the reports of that committee be referred to a committee of the whole house. Upon this occasion, Mr Dundas, in a long speech, enumerated the causes of the calamities of the East, particularly the departure of the Company's presidencies from the line of policy prescribed to them, namely, to avoid military operations with a view to conquest; the corrupt interference of their servants in the domestic and national quarrels of the country powers; their breaches of faith and disregard of treaties; their peculation and scandalous oppression of the natives; and the criminal relaxation on the part of the directors in the exercise of their controlling power over their servants, and their ready connivance at the grossest misconduct. Mr Dundas also brought forward a variety of other resolutions, which were adopted by the house; and criminated in strong terms Sir Thomas Rumbold, formerly governor of Madras, and Mr Hastings, then governor-general of Bengal. Among various charges, it was stated that Sir Thomas Rumbold had remitted to Europe, between the 8th of February 1778, the day of his arrival at Madras, and the beginning of August in the same year, the sum of L.41,000; and during the two subsequent years a fur-

ther sum of L.119,000, amounting in all to L.160,000; although his salary did not exceed L.13,335 per annum, and he had no other fair means of acquiring wealth. He was charged with having abolished the committees instituted to superintend the payment of the revenue due by the zemindars, or natives holding lands under the Company; with having compelled them to travel many hundred miles to negotiate separately with himself the terms on which they were to hold their estates; with having suffered his private secretary to receive a bribe of no less than L.20,000; with having concealed other peculations of the Company's servants; with having given a lease of lands to the nabob of Arcot, in direct disobedience of the Company's orders; and with having violated the most solemn treaties entered into with the nizams of the Deccan. Charges so heavy could not be passed over, and leave was accordingly given to bring in a bill of pains and penalties against Sir Thomas Rumbold, and two of his associates, Peter Perry and John Whitehill, for breaches of public trust and high crimes and misdemeanours; and at the same time an act was passed restraining those persons from leaving the kingdom, and obliging a discovery of their property, and preventing its alienation.

In other resolutions brought forward on the 15th of April, Mr Dundas stated a variety of accusations against Mr Hastings and Mr Hornsby; and a resolution was adopted, declaring it to be the duty of the directors of the East India Company to recal the governor-general, and Mr Hornsby the president, from their respective offices. Accordingly, the court of directors issued orders for this purpose; but these were appealed from to a court of proprietors, who, on the 31st of October 1782, prohibited the court of directors from complying with the resolution of the House of Commons. The result was, that Mr Hastings retained his office, and Mr Dundas, in the following session of parliament, brought forward the bill which we have already mentioned, but which was not passed into a law.

At the same time that Mr Dundas, as chairman of the secret committee, brought forward the resolutions already mentioned, the select committee presented their report; and on the 18th of April, General Smith, their chairman, proposed various resolutions, in some of which Mr Hastings was criminated along with Sir Elijah Impey, chief-justice of the supreme court of Bengal. By means of investigations carried on by this committee, the leading members of opposition, particularly Mr Fox and Mr Burke, qualified themselves for directing at a future period the attention of the legislature and of the public to the state of Indian affairs. Mr Fox made use of his knowledge to bring forward the two remarkable bills already mentioned; and to justify so strong a measure, it was alleged that, by the mismanagement of the courts of directors and proprietors, the affairs of the Company had been brought into such a state of extreme embarrassment as rendered it absolutely necessary to vest the administration in other hands.

These abuses were arranged under three heads, as they affected, first, the independent powers of India; secondly, the states in alliance with us; and, thirdly, our own territorial possessions. Under the *first* head were classed the extravagant projects and expensive wars entered into by the Company to extend their dominions; their violations of treaty; the sale of their assistance in support of the ambition, rapacity, and cruelty of others; and the betraying in turn almost every prince, without exception, with whom they had formed any connection in India. The *second* class of abuses comprehended the corrupt and ruinous interference of the Company in the internal government of the princes dependent on them; the unjust

Reign of George III. of exaction of exorbitant aids and tribute; the enormous peculations of the Company's civil servants; and the rapacity of the military. The *third* included the management of the countries under the immediate dominion of the Company, with respect to which it was affirmed, that the general system of their conduct in India was directed to a single end, the transmission of wealth from that country to this. With this view, monopolies had been established, not only of every article of trade, but even of the necessities of life; the privilege of pre-emption had been secured to the Company; and a variety of no less ruinous and arbitrary preferences followed. By this oppressive conduct the merchants and bankers of India, many of whom in extent of trade and credit were scarcely equalled by those of the first class in Europe, fell gradually into decay; whilst the native cultivators and manufacturers were obliged to accept of a bare sufficiency for their maintenance, measured out to them by the judgment of those who alone were to profit by their labour. The case of the zemindars, and of the cultivators under them, was, if possible, still more deplorable. At the time we obtained the dewanee or stewardship from the Mogul, the provinces of Bengal and Bahar had been laid waste by a famine, which carried off upwards of one third of the population. But the first thing done for their relief was to exact from the remainder the same tribute which had before been paid by the whole. Nor was this all. The Company's government in India had set up to public auction the whole landed interest of Bengal, without the least regard to the rights of private property, or even giving a preference to the ancient possessors; and the zemindars, most of them persons of ancient families and respectable fortunes, were under the necessity of bidding against every desperate adventurer and schemer, or of seeing their estates delivered up to the management of strangers. The sufferings of the natives under our dominion in India were further aggravated by their being almost wholly excluded from any share in the expenditure of the Company's government; all the principal collections of the revenue, all the honourable, all the lucrative situations in the army, all the supplies and contracts of every kind, were in the hands of the English; so that the natives, with few exceptions, were only employed as the servants or agents of Europeans, in subordinate stations in the army, and in the inferior department of collection, where it was impossible to proceed a step without their assistance. It was therefore urged, that the present government of India was not in its nature capable of reform. Nothing could be expected from the court of proprietors, because the members, as individuals, derived more profit from supporting Indian delinquents, than they could ever hope to receive from the fair dividends of the Company; and the court of directors, being a representative body, naturally partook of the imperfections of its constituents. In these views Mr Fox was powerfully supported by the splendid eloquence of Mr Burke. But Mr Pitt contended, that although India undoubtedly wanted reform, the alteration to be adopted ought to be constitutional, and not such as in its principle endangered the safety of every chartered incorporation in the kingdom. The company's charter was not the result of the mad prodigality of a Plantagenet, a Tudor, or a Stuart, but a fair purchase deliberately made from parliament, which could not be violated without a gross disregard to public faith. By vesting the whole patronage of India in commissioners nominally appointed by parliament, but actually selected by administration, the influence of the crown would be augmented to a degree which would enable it, like an irresistible torrent, utterly to overpower and sweep away the remaining liberties of the country. On the other hand,

Mr Dundas did not object to the measure under consideration because it increased the influence of the crown, but because it did what was much worse, by placing a new and unexampled influence in the hands of the minister and his party for five years, which would be independent both of the crown and the parliament. The bills were further attacked, not merely by those persons who might be supposed to aspire to supplant ministers in their offices, but also by several country gentlemen of independent character and high reputation for integrity; whilst the ordinary members of opposition impugned the motives of their author in very pointed terms.

The principal supporters of the bills were the two secretaries of state, Mr Burke, Mr Sheridan, Mr Erskine, Mr Lee, Mr Adam, Sir Grey Coupar, Mr Anstruther, Mr Courtney, Mr Rigby, Lord Maitland, and Sir Henry Fletcher; and they were opposed by Mr William Pitt, Mr Thomas Pitt, Mr Jenkinson, Mr Powis, Mr Dundas, Mr Macdonald, Sir James Lowther, Mr Duncombe, Mr Martin, the Marquis of Graham, Mr Arden, Mr William Grenville, Mr Beaufoy, Mr Wilberforce, Lord Mulgrave, and Mr Wilkes. The first bill, however, was carried by a considerable majority; and on the 9th of December it was presented to the House of Lords by Mr Fox, attended by a great number of members. On the first reading, Earl Temple, Lord Thurlow, and the Duke of Richmond, reprobated the measure in the most unqualified terms, but without calling for a vote of the house; and Lord Thurlow, at the same time, pronounced a panegyric upon the character and services of Mr Hastings.

Reign of George III. Meanwhile an alarm seems to have been excited in the mind of the sovereign. He had reluctantly given way to the strength of the coalition, and conferred upon its leaders the first offices of the state; and he now heard it alleged, with some plausibility, that this combination of ambitious men, not satisfied with the ordinary influence attending their situation, were about to fortify themselves in the possession of power in such a way as gradually to enable them to become independent both of him and his people. The moment seemed therefore to have arrived when temporizing measures could no longer be pursued, and a stand must be made for the support of the royal prerogative. Accordingly, on the 11th of December his majesty had a conference with Earl Temple, in which he confessed himself completely convinced of the correctness of the views entertained by opposition; and although it was now somewhat late to oppose a measure which had been brought forward by the ministers of the crown, and carried through the House of Commons under the apparent sanction of the royal authority, a resolution was nevertheless adopted to endeavour to prevent its further progress by means of the House of Lords. A card was accordingly circulated, understood to be sent by Earl Temple, in consequence of written authority from his majesty, in which it was stated, that his majesty allowed Earl Temple to say, that whoever voted for the India bill was not only not his friend, but would be considered by him as his enemy; and that if these words were not strong enough, Earl Temple might use whatever words he should deem stronger or more to the purpose. The consequence of this interposition was, that, on the 15th of December, upon a question of adjournment in the House of Lords, the ministers were left in a minority of eight. On the same day Mr Baker brought forward a motion in the House of Commons, to declare, that, to report any opinion of his majesty, upon proceedings depending in parliament, with a view to influence the votes of the members, is a high crime and misdemeanour, and a breach of the fundamental privileges of parliament. This motion was seconded by Lord Maitland, and supported by references to the journals, and by the principle, that

Reign of
George III.

advice ought only to be given to the king by his ministers, who are responsible for all the measures of government. Mr Pitt, however, opposed it, as proceeding upon unauthenticated rumours, and asserted that the precedents alluded to in the journals were not applicable to the present case. But the motion was nevertheless carried by a large majority; and as it was feared that a dissolution would instantly take place, the house resolved that they would consider any person as an enemy to his country who should advise his majesty to interrupt their discharging the important duty of providing a remedy for the abuses which prevailed in the East Indies, and that they would resolve themselves into a committee on the state of the nation on the 22d December. But on the 17th Mr Fox's India bill was rejected in the House of Lords; and at twelve o'clock on the night of the 18th a message was delivered to the secretaries of state, requiring them to transmit to his majesty the seals of their offices, by the under secretaries, as a personal interview would be disagreeable to the king. Early next morning, letters of dismissal, signed by Earl Temple, were sent to the other members of the cabinet, and a general resignation of offices followed.

A new administration was immediately formed, in which Mr Pitt was appointed first lord of the treasury and chancellor of the exchequer; the Marquis of Caermarthen and Mr Townshend, who had been created Lord Sidney, were made secretaries of state; Lord Thurlow became lord high chancellor; the privy-seal was transferred to the Duke of Rutland; Earl Gower became president of the council; the Duke of Richmond was made master of the ordnance, and Lord Howe first lord of the admiralty; Mr Grenville and Lord Mulgrave were appointed joint paymasters of the forces, and Mr Henry Dundas treasurer of the navy; the office of lord advocate of Scotland, which this gentleman had formerly held, being transferred from the Honourable Henry Erskine to Mr Ilay Campbell.

A spectacle was now about to be exhibited which had long been unknown in Britain,—that of an administration appointed by the crown, in direct opposition to the House of Commons. This, however, was no longer the House of Commons which had subdued the royal prerogative, and contended with success against our ablest and most ambitious monarchs. The late coalition had produced throughout the nation a general distrust of the character of those who formed the majority of its members; and it was soon found that a representative body possesses little power or influence, and may be safely disregarded, when it ceases to be the organ of the public sentiments. It was expected that an immediate dissolution of parliament would take place; but the change of the highest officers of the crown having been hastily made, it is probable that the new ministry dreaded entering instantly upon the business of an election against the powerful parties coalesced in opposition to them. The majority of the House of Commons also dreaded a dissolution, and, on Monday the 22d of December, they voted an address to the king, stating the present inconveniencies which would attend a prorogation or dissolution of parliament. His majesty returned an answer on the 24th, acquiescing, in general terms, in the sentiments contained in the address, and assuring the house that, after a short adjournment, their meeting would not be interrupted by any prorogation or dissolution.

When the house met on the 12th of January, Mr Fox attempted to introduce, previous to any other business, the discussion of certain resolutions which had been prepared by the opposition; whilst the new ministers endeavoured, by means of a stratagem, to be heard first, Mr Pitt declaring that he had a message to deliver from the king. But after some tumult, Mr Fox being allowed to proceed, called upon Mr Pitt to give the house an assu-

rance that no dissolution would take place; and the latter, having declined to comply with this requisition, Mr Fox moved that the house should resolve itself into a committee on the state of the nation, and the motion was carried by a large majority. It was then resolved, that to issue public money after a prorogation or dissolution of parliament, unless an act had previously passed, appropriating the supplies to specific services, would be a high crime and misdemeanour; that, in the present state of his majesty's dominions, it was necessary to have an administration possessing the confidence of the house and the public; that the recent appointments did not enjoy the confidence of the house; and that the second reading of the mutiny bill should be deferred till the 23d of February. Warm debates ensued upon these resolutions. The Coalition was branded as a corrupt confederacy of two desperate factions to seize upon the government of the country; and the India bill was represented as an experiment made by the late secretary of state, with a view to raise himself to a degree of power superior to that of the sovereign. On the other hand, the new administration was described as a coalition, not indeed of parties, but of the shreds and remnants, of the dregs and outcasts, of parties; as a body collected for the purpose of fighting the battles of secret and unconstitutional influence, of trampling on the power and dignity of the House of Commons, of establishing a government of cabal, intrigue, and favouritism, and of destroying the very principles of laudable ambition and honourable service in the state.

On the 14th of January Mr Pitt obtained leave to bring in a bill for the better government and management of the affairs of the East India Company. By this bill, commissioners were appointed by his majesty, authorized to superintend and control all operations of the courts of directors and proprietors of the East India Company, relative to the civil and military government or revenues of the territories and possessions of the Company. This board of control was to have access to all papers belonging to the Company; and the court of directors was on no pretence to send out orders to India, without the previous approbation of the board, which was also authorized to alter and amend the orders of the directors. His majesty was authorized to name the commanders-in-chief in India, and to remove any governor, general, or member of the councils, of any British settlement in India; and all nominations by the court of directors to these offices were declared to be subject to the approbation of his majesty; nor was the court of proprietors allowed, for the future, to revoke any proceeding of the court of directors which had been approved of by his majesty. It was objected to this bill, that it disfranchised the East India Company, or violated their charter, no less than Mr Fox's bill had done; and although a meeting of the court of proprietors had passed a vote in favour of the regulations contained in it, yet at the second reading, on the 22d of January, it was negatived by a small majority.

The discussion of this bill did not prevent the House of Commons from endeavouring to shake the determination of the court, and to intimidate the new administration. A resolution was moved and carried, declaring in pointed terms the disapprobation of the house, of the appointment and continuance in office of the present ministers, which they considered as unconstitutional. Mr Pitt was also called upon to explain upon what principle he ventured to remain in office after the House of Commons had declared him unworthy of their confidence. He answered, that though novel and extraordinary, his conduct was by no means unconstitutional; that the immediate appointment or removal of a minister did not rest with the house; that he neither could or ought to remain long in such a

Reign of
George III.

Reign of George III. of situation; but that he was bound to use his own discretion to prevent the consequences which might attend an instant resignation, from the country being left without an executive government. The public at large now began to be greatly interested in the dispute which had occurred between the king and the House of Commons. The common council of London voted an address of thanks to his majesty for the dismissal of his late ministers; and this address was followed by similar addresses from the merchants and trades of the city of London, from the city of Norwich, and other parts of the kingdom. The Coalition made some attempts in the county of Middlesex, in Westminster, and in the county of York, to turn the tide of addresses in their own favour; but in these instances, if they avoided a defeat, they gained no victory.

In the meanwhile, a number of independent members of the House of Commons attempted to heal the present breach by proposing a new coalition of parties, and the formation of an administration upon a still broader basis than formerly. On the 26th of January, about seventy members of the House of Commons met at the St Albans tavern, and signed an address, to be presented, by a committee of their body, to the Duke of Portland and Mr Pitt, requesting them to communicate with each other on the arduous state of public affairs, and expressing a hope that, by a liberal intercourse, every impediment to a cordial co-operation of men of character, acting on the same public principles, might be removed. In answer to this address, both parties expressed themselves desirous to comply with the wishes of so respectable a meeting; but the Duke of Portland declined any interview with Mr Pitt, for the purpose of union, while that gentleman continued prime minister in defiance of the resolutions of the House of Commons; and, on the other hand, Mr Pitt refused to resign as a preliminary to negotiation. To co-operate with the St Albans meeting, one of its members moved and carried unanimously a resolution, that the present critical state of public affairs required an efficient, extended, and united administration, entitled to the confidence of the people; and it was also resolved that the continuance of the present ministers in office was an obstacle to forming an efficient, extended, and united administration; resolutions which were ordered to be laid before his majesty. The meeting at the St Albans tavern next declared that an administration formed on the total exclusion of the members of the last or present administration would be inadequate to the exigencies of public affairs. Mr Fox expressed his wishes for a union, but insisted on the resignation of the chancellor of the exchequer in compliance with the resolutions of the House of Commons, as an indispensable preliminary. Mr Pitt, on the contrary, adhered to office, and declared that the house might address the crown for his dismissal; but till the king should think proper to remove him from his situation, he held it to be neither illegal nor unconstitutional to retain it, and would not recede from his former determination. He at the same time suggested, that there might be persons on the opposite side of the house with whom he could not act. Lord North, understanding himself to be alluded to, declared his readiness to relinquish his pretensions to an official situation, if these should be deemed any obstacle to a union; and this self-denying declaration was received with great applause. Mr Marsham, Mr Powis, and other members of the St Albans association, then called upon Mr Pitt to yield to the pressing exigencies of his country, but in vain. These gentlemen, however, still continued their efforts; and, to remove the difficulty arising from Mr Pitt's refusal to resign, or to save the honour of the house upon that point, they procured the royal interference to the extent of requesting that a negotiation should be set on foot between the Duke of

Portland and Mr Pitt. A message was accordingly sent by Mr Pitt, acquainting the duke that he was commanded to signify to him his majesty's earnest desire that his grace should have a personal conference with Mr Pitt for the purpose of forming a new administration, on a wide basis, and on fair and *equal* terms. The duke requested an explanation of the message with regard to the words *equal terms*; but Mr Pitt declined any preliminary discussion. The Duke of Portland likewise proposed that he should be permitted to understand that the message implied a virtual resignation by Mr Pitt, or that he himself should receive his majesty's commands personally relative to the conference. But both of these propositions were refused, and here terminated the efforts of the St Albans association.

On the 18th of February the chancellor of the exchequer, in his place in the House of Commons, being required to say, previous to the consideration of the question of supply for the ordnance department, whether any communication was to be expected relative to the resolutions of the house which had recently been laid before the king, replied, that his majesty, after considering all the circumstances of the country, had not thought fit to dismiss his ministers, and that his ministers had not resigned. This produced a warm debate, in which it was observed by Mr Fox, that it was the first instance since the revolution of a direct denial on the part of the crown to comply with the wishes of the House of Commons; and he threw out a hint that it might be necessary for the house to protect its own authority by refusing to vote the supplies. But to allow his majesty's ministers time to consider well their situation, he proposed to defer the report of the ordnance estimate for two days. The refusal of the supplies was treated by the friends of the new administration as a threat which the utmost madness of faction would not seriously attempt to execute, and which could never be justified by his majesty's refusal to dismiss ministers who had been condemned without a trial. On a division, however, there appeared a majority of twelve for postponing the supplies. On the 20th of February a new address to the throne for the removal of the ministers was carried by a majority of twenty-one; and on the 27th his majesty's answer was reported by the speaker, in which it was stated that no charge or complaint had been suggested against the ministers, nor was any one of them specifically objected to; and that, on the other hand, numbers of his subjects had expressed to his majesty the utmost satisfaction with the change of his councils. This answer was abundantly artful, as it tended to alienate the people from the House of Commons, and, at the same time, to perplex the Coalition, who could not accuse the prime minister of any political crime, as he was a young man, who had never enjoyed the chief direction of any important affair. A second address to the throne, however, was moved in the House of Commons on the 1st of March, and agreed to by a majority of twelve, remonstrating against the answer to the former address. His majesty replied in civil terms; but persevering in his resolution to retain his ministers, the opposition resolved to make a last effort to overcome the royal determination. Mr Fox declared that he would not propose an address to the throne, because he wished for no answer, but a humble representation, to which it was not customary to make any reply. And this representation consisted of a long remonstrance against the alleged unconstitutional appointment of an administration in opposition to the wishes of the House of Commons; and concluded by stating, that the house had done its duty in pointing out the evil, and that the blame and responsibility must henceforth lie wholly upon those who had presumed to advise his majesty to act in contradiction to the

Reign of George III.

Reign of
George III.

uniform maxims which had hitherto governed his own conduct, as well as that of every other prince of his illustrious house. This representation was carried by a majority of only one vote, which the Coalition appear to have considered as a defeat; for they finally yielded to their destiny, and suffered the mutiny bill, which had been their last security against a premature dissolution, to pass in the usual terms.

Soon after the partial cessation of this struggle, parliament was dissolved; and in the elections which ensued, the new administration were extremely successful. Upwards of a hundred and sixty members of the former House of Commons lost their seats; and of these, nearly the whole were the friends of the previous administration. Thus the defeat of a powerful combination was completely accomplished, and its leaders were rendered of little importance in the legislature of the empire; and thus terminated the strength of the celebrated Coalition, the fate and effects of which ought never to be forgotten. That unfortunate measure may be said to have ruined the political fortunes of Mr Fox, undoubtedly one of the most accomplished statesmen whom Britain ever produced. From that period he was generally regarded as unfit to be intrusted with power; his eloquence ceased to persuade, and his counsels, even when full of wisdom, were regarded with distrust, because his coalition with Lord North constantly rose up against him, and suggested suspicions of his integrity, or at least of his wisdom. This coalition also had a tendency to diminish the attachment of the nation to the House of Commons, and its confidence in that branch of the legislature which, in fact, might be nothing more than a combination of factious men aiming at personal aggrandizement, and in certain circumstances rendering it necessary for the people to arrange themselves behind the throne, in order to obtain protection against one of the worst and most oppressive of all governments, that of a corrupt aristocracy.

On the 18th of May the new parliament assembled; and in the speech from the throne his majesty assured both houses of his satisfaction in meeting them, after recurring, in so important a moment, to the sense of his people, and of his reliance on their being animated by the same sentiments of loyalty and attachment to the constitution which had been so fully manifested throughout the kingdom. He directed their attention to the affairs of the East India Company, but warned them against adopting any measures which might affect the constitution; and concluded with expressing his inclination to maintain, in their just balance, the rights and privileges of every branch in the legislature.

The affairs of the East India Company were speedily brought before parliament. On the 24th of June a bill was introduced by the chancellor of the exchequer to allow the Company to divide four per cent. on their capital for the half year concluding at midsummer 1784. The necessity of the case was urged in justification of this bill for supporting the credit of the Company; and it was alleged, that notwithstanding their present distresses, which were admitted to be great, there existed a sufficient probability that their affairs upon the whole might warrant such a dividend. The bill passed through both houses, and received the royal assent. On the 2d of July, Mr Pitt brought forward another bill, which had for its object to allow the Company a respite of duties due to the exchequer, to enable them to accept of bills beyond the amount prescribed by former statutes, and to establish the regularity of their future dividends. This act gave rise to various debates, particularly in consequence of a question put by Mr Philip Francis, how far the honour of parliament would be pledged by it to enable the East India Company to make

payment of the bills accepted by them, in case the funds of the Company should prove deficient. But it nevertheless passed into a law; and Mr Pitt, still further to support the East India Company, brought forward a bill to diminish the duty upon tea, for the sake of preventing smuggling, and in lieu thereof to substitute a commutation tax upon windows. The amount of the revenue raised from tea was between L.700,000 and L.800,000; and the object of the new act was to proportion it in such a way as to raise upon that article in future no more than L.169,000, which it was supposed would enable the Company to sell thirteen millions of pounds of tea, instead of five millions and a half.

But these, which all passed and received the royal assent, were subordinate to the bill for regulating the general management of the affairs of the Company, which, though framed upon the same model with that proposed by Mr Pitt in the last parliament, yet differed from it in several particulars. The powers of the board of control were enlarged; in cases of urgency and secrecy, it was authorized to transmit its own orders to India without these being subject to the revision of the court of directors; in the governor-general and council of Bengal was vested an absolute power over the other presidencies in transactions with the country powers, and in all applications of the revenues and forces in time of war; the receiving of presents was declared to be extortion and disobedience of orders; the Company's servants were required, on their return to England, to lodge in the exchequer a statement upon oath of their whole property; and for the effectual punishment of crimes committed in the East Indies, a new court of justice was instituted.

Mr Francis opposed in strong terms the general principle of this bill, as tending to create an incongruous power, nominal on the part of the directors, real on the part of administration; and Mr Fox affirmed that the proposed board of control violated the privileges of the India Company no less than the enactment of his bills had done, whilst it increased in a greater degree the dangerous influence of the crown. He treated with great contempt the new court of judicature, which he said might fairly be called a bed of justice, as justice would sleep upon it, and thereby embitter the calamities of India, by removing all fear of punishment. When the bill came to be discussed in the committee, Mr Pitt acted in a manner which afterwards on many occasions distinguished his mode of transacting the national business. Instead of coming forward, like the leader of a party, with a measure complete in all its parts, and prepared to receive the firm support of his adherents, he not only of himself proposed some essential alterations, but adopted those suggested by others, whether friends or antagonists. The consequence was, that, in the committee, it underwent important modifications. The power of issuing orders, in the first instance, was limited to the case of the court of directors neglecting to transmit dispatches to the board, after fourteen days' notice, upon any subject which the board might think it necessary to take up. The directors were also empowered to elect a secret committee of three members, to communicate with the board concerning such orders as the board might of its own authority transmit to India. The appointment of the commander in chief of the army was withdrawn from his majesty, and left with the Company, together with the negative upon nominations in general. Mr Pitt himself also brought forward some amendments respecting the constitution of the new tribunal. Authority was now given to any person or persons to move the Court of King's Bench for an information. The court was also authorized to issue commissions to the courts in India, for the purpose of taking depositions; and the direc-

Reign of George III. of tors of the Company, and persons returning from India, were excluded from the judicature that was to be erected. The bill, thus amended, passed the House of Commons on the 28th of July, and the House of Lords on the 9th of August.

Early in July the chancellor of the exchequer informed the House of Commons that Sir Elijah Impey, chief judge of the supreme court of justice of Bengal, had arrived in England, in consequence of being recalled by his majesty, pursuant to an address of the house. The acute sensibility or powerful imagination of Mr Burke having induced him to interest himself greatly in the sufferings of the natives of India under the British government, he now called on the ministry to enforce the resolutions of the house respecting Sir Elijah Impey, by bringing him to trial; and he repeatedly endeavoured to introduce as the subject of deliberation the reports of the committees of the former parliament respecting Indian affairs; but he was either defeated, with little reply, by a motion for the order of the day, or overpowered and silenced by the loud and continual clamour of the house.

During the present session it was found necessary to have recourse to a loan of six millions, to settle the remaining expenses of the American war. The naval establishment was at the same time fixed on a higher scale than in former years of peace. The number of seamen and marines voted was twenty-six thousand; but the military force was not large, as it did not exceed seventeen thousand five hundred men for guards and garrisons. Several new taxes were imposed upon linen and cotton manufactures, hats, paper, candles, bricks, postage of letters, horses, hackney-coaches, persons dealing in excisable commodities, and persons engaging in the amusement of shooting game or hunting, none of which met with almost any opposition.

The session closed with a motion, brought forward by Mr Dundas, for the restoration of the estates forfeited in Scotland in the rebellion of 1745, to the descendants or other heirs of the rebels. As this measure had for its object the relief of individuals whose unequivocal attachment to his present majesty and his family could not be supposed to be tainted or affected by the crimes of their ancestors, it met with the approbation of the Commons; but in the House of Lords it was opposed by the Lord Chancellor Thurlow, on the ground both of its impolicy and its partiality; impolicy, as rendering nugatory the settled maxim of the British constitution, that treason was a crime of so deep a dye that nothing was adequate to its punishment but the total eradication of the person, the name, and the family, out of the society which he had attempted to injure; and partiality, because the estates forfeited in 1715, and which were forfeited upon the same grounds and principles as those in 1745, were passed over in silence, whilst a person who had been forfeited in 1690 was even included in the provision. The bill, however, passed the Lords, and received the royal assent.

At this time the British nation enjoyed profound peace; and the public attention being no longer excited by national efforts, or by the enterprises of any political faction, was easily directed to objects of less importance, among which may be mentioned the discoveries in aerostation, which had hitherto proved of more curiosity than utility.

Parliament assembled again on the 25th of January 1784. In the speech from the throne, the object particularly recommended to the attention of both houses was the final adjustment of the commercial intercourse between Great Britain and Ireland. The first business taken up related to the choice of two members of parliament for Westminster at the late general election. Lord Hood, Mr Fox, and Sir Cecil Wray, had offered themselves

as candidates. Lord Hood easily carried his election; but between the other candidates the contest was carried on with unexampled obstinacy. The engaging manners of Mr Fox, who had for some time represented the city of Westminster in parliament, enabled him, however, notwithstanding the general unpopularity of the Coalition, to engage with success in the contest. After the election had continued upwards of six weeks, it was concluded on the 17th May 1784, leaving a considerable majority in favour of Mr Fox. At this time, being the very day previous to the return of the writ for the election, the high bailiff, at the request of Sir Cecil Wray, granted a scrutiny into the votes which he had taken. This was protested against by Mr Fox and several of the electors; and immediately on the meeting of parliament, the conduct of the high bailiff was vehemently attacked by opposition, and no less vigorously defended by administration. On a motion of Lord Mulgrave, however, it was resolved that the high bailiff of Westminster should proceed in the scrutiny with all practicable dispatch. In the beginning of February the business was resumed in the House of Commons. The scrutiny had continued eight months, and only two parishes out of seven had been scrutinized; so that it was admitted that probably more than two years longer would be necessary to finish the scrutiny. On the 8th of February, however, Mr Welbore Ellis moved that a return of the election be immediately made by the high bailiff of Westminster; and, after a variety of debates, it was at length carried, and Lord Hood and Mr Fox were returned as members for Westminster.

On the 18th of February, the attention of the House of Commons was called to the payment of the debts of the nabob of Arcot. The statute which Mr Pitt had got passed during the preceding summer authorized in general terms the court of directors to establish, in concert with the nabob, funds for the payment of such of his debts as should appear to be justly due. The court of directors accordingly ordered the council at Madras to investigate these debts; but the board of control, with some trifling limitation, ordered the whole debts to be paid out of the revenues of the Carnatic. Mr Dundas undertook the defence of the board of control, and treated with ridicule a declaration made by Mr Francis, that rumours were abroad of a collusion between the board of control and the creditors of 1777. He justified the whole of the nabob of Arcot's debts. One set of debts incurred in 1767 consisted of money borrowed by the nabob at the rate of from thirty to thirty-six per cent. interest, to pay off a sum due by the nabob to the Company, which was at that time in the utmost distress, and the interest had afterwards been reduced to ten per cent. The second branch of the nabob's debts had arisen from sums borrowed to pay off his own cavalry, which the Company had ordered him to reduce, but which he was unable to dismiss from want of money to pay their arrears. He had borrowed this money, and the Company had engaged its credit for the loan. A third class of debts, incurred or consolidated in 1777, were acknowledged by the nabob to be valid, and were only approved of by the board of control, subject to his objections, or to objections by the Company or the rest of the creditors.

Mr Burke stated a variety of objections to the nabob's debts. It appeared that the nabob had contracted a debt with the Company's servants to the amount of L.888,000 sterling, which, in the year 1767, was settled at an interest of ten per cent. In the year 1777 a second debt of the nabob of Arcot, amounting to L.2,400,000, was settled at twelve per cent. interest; and to this was added another debt, called the cavalry debt, of L.160,000, at the same interest. The whole of these four capitals, amounting to

Reign of George III.

Reign of
George III.

L.4,440,000, produced at their several rates annuities amounting to L.623,000 a year, more than half of which stood chargeable on the public revenues of the Carnatic. These annuities, equal to the revenues of a kingdom, were possessed by a small number of individuals of no consequence, situation, or profession. Mr Burke admitted that the loan of 1767 was the fairest, as it could be convicted of nothing worse than the most enormous usury. The interest at thirty-six per cent. was first paid, then twenty-five, then twenty, and, lastly, the interest was reduced to ten per cent.; but all along the interest had been added to the principal, so that of L.888,000 Mr Burke doubted whether the nabob ever saw L.100,000 in real money. With regard to the cavalry debt, Mr Burke stated, that instead of ready money, the English money jobbers engaged to pay the nabob's cavalry in bills payable in four months, for which they were to receive immediately at least one per cent. per month, but probably two, such being the rate generally paid by the nabob, and that a territorial revenue was assigned to them for that purpose; but it was upwards of two years before the arrears of the cavalry were discharged; and these jobbers being all this time in receipt of the assigned revenue, they paid off the nabob's troops with his own money. As to the debt of 1777, Mr Burke observed, that in different accounts the principal sum rose from L.1,300,000 to L.2,400,000, and the creditors had never appeared the same in any two lists. In the year 1781 they were satisfied to have twenty-five per cent. at once struck off from the capital, yet they were now to obtain payment of the whole. It appeared, therefore, that the nabob and his creditors were not adversaries, but collusive parties; and that when the nabob gave an acknowledgment of debt to a European, he received no money, and only endeavoured to support his own influence by receiving the servants of the Company into his pay. The motion for an inquiry into the conduct of the board of control on this occasion was however negatived on a division.

When Mr Pitt came into office, he had the singular good fortune of being highly popular with the nation, while he was selected to support the royal prerogative and authority against the majority of the House of Commons, then possessed by the Coalition. Accordingly, it became one of the features of his conduct to attempt, if possible, to reconcile the services expected from him by the crown with the apparent pursuit of whatever measure happened for the time to be an object of popular favour. The attempt to procure a reform in the representation of the people in the House of Commons was one of these objects. He had formerly engaged in it while acting in opposition; and now, after he had become the first minister of the crown, he still undertook to stand forward as its advocate. Every writer of history must be sensible of the defective nature of the details which he is able to give as to the causes which produce or regulate the most important events, and which often lie hidden in a region far beyond the limits of his penetration or research. In what way, or by what means, Mr Pitt contrived to retain the confidence of his master, whilst he at the same time stood forward as the champion of a reform which every body knew to be hateful at court, it is impossible to conjecture. Certain it is, however, that after he had attained to the chief place in the present administration, he still continued to correspond with the leading advocates of parliamentary reform, whose meetings he had been accustomed to attend. In a circular letter to Mr Wyvil, president of a committee of Yorkshire gentlemen, it was stated that Mr Pitt had given authority to declare, that he would bring forward the subject of a parliamentary reform as early as possible in the session; that he would support his intended proposi-

tions to the utmost of his strength; and that he would exert his whole power and credit, as a man and as a minister, honestly and boldly, to carry such a system as should place the constitution on a footing of permanent security. And at the commencement of the session, when the subject was alluded to, Mr Pitt took the opportunity to declare, that on this business he laboured incessantly; that it was that which of all others was nearest his heart, but at so early a period of the session it was impossible to state his plan specifically; that much remained to be done, but his ideas were not matured; that a reform in parliament comprehended a great variety of considerations, relating to the essentials of the constitution; that in this path he was determined to tread, but he knew with what tenderness and circumspection it became him to proceed; and he requested the house to come to the subject uninfluenced by any of those schemes and hypotheses which had hitherto been suggested.

It was not till the 18th of April, however, that he called the attention of the house to this important subject. He declared himself aware of the difficulties he must expect to encounter in proposing a plan of reform; but he entertained more sanguine hopes of success than formerly, because there never was a moment when the minds of men were more enlightened on this interesting topic, or more prepared for its discussion. He was particularly anxious to remove the objection of innovation. Anciently great fluctuations had taken place in the franchise. The number of members had varied, and even the representation of the counties was not uniform. As one borough decayed and another flourished, the first was abolished and the second enfranchised. This arose from a maxim the application of which was intrusted to the crown, that the principal places, and not the decayed boroughs, should be called upon to exercise the right of election. He was no advocate for a revival of this discretionary power, but the maxim upon which it was founded ought now to be carried into effect. The outline of his plan was this: To transfer the right of choosing representatives from thirty-six of such boroughs as had already fallen, or were falling into decay, to the counties, and such chief towns and cities as were still unrepresented; to provide a fund for the purpose of giving to the owners and holders of such boroughs disfranchised, an appreciated compensation for their property; and to make the receiving of this compensation a voluntary act of the proprietor, and if not received when tendered, to place it out at compound interest, until it became an irresistible bait to such proprietors. He also proposed to extend the right of voting for knights of the shire, to copyholders as well as freeholders. Besides the thirty-six boroughs already mentioned, he proposed to purchase the franchise of other boroughs, and to transfer the right of returning members to unrepresented large towns, which should petition parliament for the privilege. Thus a hundred members would be given to the popular interest of the kingdom, and the right of election extended to a hundred thousand additional persons. Mr Fox disapproved of purchasing from a majority of the electors of a borough the property of the whole, and of holding out pecuniary temptations to an Englishman to relinquish his franchise, though he declared himself a friend to the general principle of a more equitable representation. Mr Wilberforce supported Mr Pitt's proposal, because, by putting an end to the representation of the decayed boroughs, dangerous aristocratical coalitions would in future be prevented. But it was warmly opposed by Mr Povey, who alleged that the people of England had not called for reform, and that the business in which Mr Pitt had unfortunately engaged himself was a volunteer crusade, or a piece of political knight-errantry. Lord North likewise

Reign of
George III.

Reign of George III. opposed all change, alleging that the people were actually contented, happy, and in full possession of their liberties. And, finally, leave to bring in the bill was refused by a large majority; which was probably the very result Mr Pitt not only anticipated, but also desired.

As the sole object for which the English monarchs anciently assembled their parliaments was to obtain money from their subjects, so the adjustment of the public expenses, and levying adequate supplies, always continue to occupy a large portion of the time of every session of parliament. The prodigal expenditure which had taken place during the war still required additional taxes. For this purpose new demands were made. Hawkers and pedlars, and attornies, were taxed; and the duties on male servants and post horses were enlarged. An impost laid upon retail shops, however, encountered persevering opposition in parliament, as well as much unpopularity in the nation. It was represented as unfair, because it fell upon a small number of industrious persons; and it was observed, that, unlike other taxes, those who imposed it were in no hazard themselves of paying any part of it. But of all the taxes proposed by the minister, none encountered such sarcastic animadversion as that upon maid-servants; and Mr Pitt, who was understood to be something of a misogynist, was accused by Mr Sheridan of holding out a bounty to celibacy. But the subject which excited most attention was that of the ordnance. As early as the year 1782, the Duke of Richmond had planned an expensive system of fortifications, for protecting the different dock-yards of the kingdom; the idea having originated in the alarm occasioned by the appearance of the combined fleet in the Channel. The works had for some time been carried on, and the sum of £50,000 annually voted, without much attention being given to the subject. But during this session it was moved that an account should be laid before the house, of the expenses already incurred on fortifications, at Plymouth, Portsmouth, Gosport, Chatham, Dover, and Sheerness, with a report of the probable expense of completing the fortifications of Portsmouth and Plymouth; and afterwards the annual grant was opposed. Mr Pitt defended the Duke of Richmond, but agreed to a proposal which had been made to take the opinion of a council of officers; and this put an end to the debate.

A bill for better regulating the office of the treasurer of the navy passed without any sort of opposition; and another for the better examining of the public accounts met with little opposition; but a third brought in by Mr Pitt, for the general reform of public offices, encountered strenuous opposition. Mr Sheridan contended that it was unnecessary, as the treasury possessed ample power to make the necessary reforms; and Mr Burke contrasted, in strong terms, the trifling economy here proposed, with the prodigality of the ministers in their proceedings respecting the revenues of the Carnatic, and the sanction given by them to the pretended debts of the nabob of Arcot. The bill, however, passed through both houses, and received the royal assent.

One of the most important subjects brought under the consideration of parliament during the session, was an attempt by Mr Pitt to establish a plan of commercial union between Great Britain and Ireland. This plan was proposed to the Irish House of Commons on the 7th of February, by Mr Ord, and consisted of ten articles, usually styled the Irish Propositions, which were passed with little debate, and an address of approbation voted to his majesty. On the 22d of the same month Mr Pitt introduced the subject to the British House of Commons. He expatiated on the false and oppressive policy which had long been pursued by government in regard to Ireland, in order to render her completely subservient to the interest and opu-

lence of this country; and concluded by proposing to allow the produce of the colonies to be imported into Britain through Ireland, and to equalize the duties on the produce and manufactures of both countries; in return for which concession it was stipulated, that the parliament of Ireland should irrevocably secure some provision for defraying the expense of protecting the commerce of the empire in time of peace. After some debates upon the subject, petitions from Liverpool, Paisley, Glasgow, Manchester, and other places, to the number of sixty, were presented against the measure; and from the 16th of March to the 12th of May the House of Commons were almost incessantly employed in hearing counsel and examining witnesses. Certain exceptions were now introduced to the general rule of admitting an equal commerce between the countries; corn, meal, flour, and beer, were excluded in favour of British agriculture; and various regulations were made to secure an effectual equality of duties upon every particular object of trade in both countries. The plan thus amended produced a variety of debates, in the course of which Lord North expressed his wish for a complete incorporative union of the two kingdoms, in preference to a partial settlement, which might prove the source of perpetual discord. The resolutions, however, were warmly opposed; and being carried by only a small majority, administration did not think proper to press the adoption of the scheme.

The American war had in some measure alienated the British nation from ideas of conquest and military splendour. Commercial pursuits were now chiefly valued, and formed the principal object of encouragement to the government, and of pursuit by the people; but to prosecute these with success, it was necessary to preserve a good understanding with the neighbouring powers; and this was effected, though with some difficulty, in consequence of certain foreign occurrences not unworthy of attention.

Joseph II. was at this time at the head of the house of Austria and of the Germanic body; and among the various projects which marked his restless career, there was one which, had it been attended with success, could scarcely have failed to affect the future condition of the Germanic body. He had entered secretly into a negotiation with the elector of Bavaria, then an infirm old man, for an exchange of the electorate of Bavaria in lieu of the provinces of the Austrian Netherlands, which were to be converted into a kingdom for the elector. Count Romanzof, the Russian minister to the diet of Frankfort, informed the Duke of Deux-ponts, nephew and heir to the elector, of the substance of this treaty; and at the same time assured him that it would be carried into execution, whether he consented to the exchange or not. In the month of January of this year the duke gave notice of the intended measure to Frederick II. king of Prussia, who regarded it as a project dangerous to his own independence, as well as to that of the other German states, and endeavoured instantly to spread an alarm through Europe. He alleged, that the proposed exchange was in the highest degree iniquitous and unfair; that though the population on both sides was nearly equal, the extent of territory on the side of Bavaria more than doubled that of the Low Countries, while their respective revenues were equally disproportioned; that in Bavaria, agriculture, commerce, and finance, were notoriously neglected, whereas in the Austrian Netherlands these resources had been extended to their utmost pitch; that, whilst the territory which the emperor hoped to acquire was capable of considerable improvement, that which he gave away might be expected to retrograde rather than to advance; that these circumstances, however, were of little importance, compared with the political consequences which must result from such a measure; that the Nether-

Reign of George III.

Reign of
George III.

lands being situated at a distance from the other Austrian dominions, had always proved a source of weakness, rather than of strength, to that power; that, although a considerable revenue was derived from these provinces, it was often dearly bought, in consequence of the wars occasioned by the vicinity of France; that great political efforts had recently been made by the court of Vienna to avoid all future grounds of quarrel with the French monarchy, and this had been accomplished by the marriage of an Austrian princess to the king of France; that the possession of Bavaria, from its vicinity to the rest of the Austrian dominions, would secure to the emperor a chain of territory from the banks of the Rhine along a great part of the course of the Danube, and give him such a preponderance as would overturn all power in Germany capable of resisting the head of the empire; and that this mighty country might, at no remote period, be consolidated into one mass, and Austria would then probably rank in every sense as the first power in Europe.

Thus reasoned Frederick the Great. Succeeding events seem to warrant a belief that such an acquisition of strength by the house of Austria might have proved of considerable utility to Europe; but at the time when the scheme was proposed it excited general apprehensions. The treaty for the exchange had been concluded under the auspices of Russia and France, and to them accordingly the king of Prussia addressed his remonstrances. But the emperor of Germany and the elector of Bavaria soon found their project so strongly disapproved of by other powers, that they absolutely disavowed it; whilst the court of France contented itself with replying to the remonstrance of the king of Prussia, that the exchange had been proposed, as depending upon the voluntary arrangement of the parties, but that, as the Duke of Deuxponts had refused his consent, the proposition of course became fruitless.

Frederick, in the mean time, exerted himself with great assiduity in negotiating a league with the electors of Hanover and Saxony, for the preservation of the Germanic constitution, and for preventing such cessions and exchanges of territory as might afterwards prove injurious to the balance of power in the empire. A treaty to this purpose was therefore concluded on the 23d of July, and several German princes acceded to it, among whom were the elector of Mentz, the landgrave of Hesse Cassel, the dukes of Brunswick, Namur, and Saxe-Gotha, and the prince of Anhalt. The elector of Hanover also entered readily into the transaction, and from that period an intimate connection commenced between the courts of London and Berlin. Some British politicians, however, supposed that the opposition made to the imperial project was unwise, as tending to excite a spirit of hostility against us on the part of Austria, which, of all the powers of the Continent, was considered as our most natural ally; and it was probably owing to the part taken by Britain in this transaction that the emperor published an edict prohibiting the importation of British manufactures into any part of the Austrian dominions. In the course of the summer also the French issued an edict restricting the sale of various articles of British manufacture, particularly saddlery, hosiery, woollen cloths, and hardware, unless upon payment of duties the amount of which was equivalent to a prohibition. To counteract these proceedings commercial treaties were negotiated with the courts of Petersburg and Versailles; that with the latter having been undertaken in pursuance of a provision in the definitive treaty of peace.

Parliament met on the 24th of January 1786. In the speech from the throne some notice was taken of the continental dispute above mentioned, which was said to have terminated in such a way as to threaten no interruption to the tranquillity of Europe. This excited some discus-

sion; but Mr Pitt declined entering into any defence of the Germanic league, as he and his colleagues in office had not interfered in the formation of it; observing that accident alone had placed the sovereignty of Hanover and of this country in the same hands, and desiring to have it understood that Great Britain was by no means bound by any leagues entered into by the elector of Hanover. Mr Fox, however, denied that the affairs of Hanover could be really separated from those of Britain. Supposing that it should hereafter appear necessary for Great Britain to join the court of Vienna against the league of the Germanic princes, and that the elector of Hanover should appear as one of those princes at the head of his own troops, he put the question, Whether a British army could be directed to act in a hostile manner against troops led by their sovereign in his character of elector of Hanover? When George I. purchased Bremen and Verden from Denmark, the minister of that day, General Stanhope, used precisely the same language, and told the House of Commons that they had nothing to do with his majesty's conduct respecting his electoral dominions. But the consequence was, that the resentment of the Swedish monarch Charles XII. on account of this transaction, threatened Great Britain with a most dangerous invasion; and the very next year General Stanhope was under the necessity of demanding additional supplies, to enable his majesty to defray the expenses to which he was exposed in consequence of his purchase.

The attention of parliament was again directed to the Duke of Richmond's plan of fortification. In consequence of the former debate on the subject, the project had been remitted to the consideration of a board of officers, of which the Duke of Richmond was appointed president; and which consisted, besides the president, of Lieutenant-generals Earl Percy, Earl Cornwallis, Sir Guy Carleton, Sir William Howe, Sir David Lindsay, Sir Charles Grey, Lord George Lennox, and John Burgoyne, and six major-generals, together with Vice-admirals Barrington and Milbank, Rear-admirals Graves and Lord Hood, and Captains Hotham, Macbride, Bowyer, Luttrell, Sir John Jervis, and Sir Andrew Snape Hammond. On the 10th of February Mr Pitt stated to the House of Commons that the board had reported to his majesty their approbation of the plan, as perfectly adequate to the defence intended, and as being at the same time the least expensive in the construction, and requiring a smaller force to defend the works, than any other that could be proposed. He also presented an estimate, which had been prepared by the board of engineers, of the expense necessary to construct the fortifications. The decision of the House of Commons, however, was delayed till the end of February, when the subject was again brought forward by Mr Pitt, who proposed a resolution, bearing, that to provide effectually for securing the dock-yards of Portsmouth and Plymouth by a permanent system of fortification, was an essential object for the safety of the state, intimately connected with the general defence of the kingdom, and necessary to enable the fleet to act with vigour and effect whenever its services were required. This led to a long and not very interesting debate, the result of which was, that upon a vote the house divided equally, when the speaker gave his casting vote in opposition to the measure. On the 17th of May, however, the question was revived by Mr Pitt, who proposed that the fortifications should still be carried on at Portsmouth and Plymouth, though upon a more limited scale; but the motion was opposed with much severity of language, and at length withdrawn.

The attention of parliament was for some time occupied with a proposal for reducing the laws relative to the militia into a general act, and providing for their being an-

Reign of
George III.

ually called out and disciplined. Mr Pitt opposed the calling out of the militia annually; but afterwards, finding that a different opinion prevailed, he consented, on condition that, though the whole number of men were balloted for and enrolled, only two thirds should be actually employed. The measure, however, did not pass without opposition.

But the subject which occupied most attention during the session was the proposal of a sinking fund to be applied towards discharging the public debt. Mr Pitt had occasionally mentioned it, during the preceding session, as a great and important national measure which he intended to bring forward; and early in the present session he moved that certain papers should be laid upon the table of the House of Commons, to enable them to form an estimate of the annual amount of the national revenue and expenditure, from which a judgment might be formed of the existing disposable surplus, and of the sum it would be further necessary to provide to raise the total to the amount requisite to form the basis of the intended sinking fund. On the 7th of March he proposed the appointment by ballot of a select committee of nine persons to examine these papers, and to report the result to the house. He stated it as his intention to take every possible step to give complete satisfaction to the nation in a matter of such general concern; and he conceived that the solemnity of a committee, and the formality of a report, would answer the purpose better than a set of unconnected papers or the affirmation of a minister. The committee as balloted consisted of the Marquis of Graham, Mr William Grenville, Mr Edward Elliot, Mr Rose, Mr Wilberforce, Mr Beaufoy, Mr John Call, Mr Smith, and Mr Addington. When this committee had made its report, Mr Pitt, on the 29th March, proposed his plan to the Commons in a committee of the whole house. He congratulated parliament upon the prospects of the nation in a style of animated eloquence. He stated the revenue for the current year, as reported by the committee, to amount to L.15,397,000. The interest of the national debt was L.9,275,769, and the civil list L.900,000, which, together with the whole other expenditure for the army and navy, and other establishments, amounted to L.14,478,000; consequently there remained a surplus of the annual income, above the expenditure, of L.900,000. One million he stated to be the sum annually to be contributed to the sinking fund; and to make up the sum of L.100,000 wanted to complete this amount, he proposed small additional taxes upon spirits, timber, and hair powder and perfumery. The sum of L.1,000,000 thus provided he proposed to place in the hands of commissioners appointed for that purpose, in quarterly payments of L.250,000 each, to begin on the 5th of the following July. It was his wish that the commissioners should consist of persons of rank and distinction, the speaker of the House of Commons, the chancellor of the exchequer, the master of the rolls, the governor and deputy-governor of the bank of England, and the accountant-general of the high court of chancery. He alleged, that by laying out the sinking fund regularly at compound interest, the million to be applied would rise to a great amount in a period that was not very long in the life of an individual, and but an hour in the existence of a nation. It would diminish the debt of this country so much as to prevent the exigencies of war from ever raising it to the enormous height which they had hitherto done. In the period of twenty-eight years, the sum of a million, annually appropriated, would produce an income of four millions annually. By placing the sum in the hands of commissioners, to be applied by them quarterly to the purchase of stock, no sum would ever lie within the grasp of a minister great enough to tempt him to infringe upon this national revenue. It

could not be done by stealth, and a minister would not have the confidence to come to the house expressly to demand the repeal of so necessary a law.

Mr Fox approved in general of the institution of a sinking fund, but thought twenty-eight years too long a period to look forward to for the effect of the project. Before that term had arrived, it was not improbable that we might have another war; and a variety of circumstances might occur, which would operate as a temptation to a future chancellor of the exchequer, and a future House of Commons, to repeal the act, annul the institution, and divert the appropriation of its stock to the immediate services of the year. He stated two specific objections to the plan. The first was, that the sum appropriated ought not to have been made unalienable in time of war; and the second, that, by the institution, parliament being bound to nobody but itself, the whole plan was liable to be annihilated by a future parliament. Mr Fox repeated his objections at a future stage, and at last, in consequence of the acquiescence of Mr Pitt, introduced an amendment, that whenever a new loan should hereafter be made, the minister should not only propose taxes sufficient to pay the interest of the loan, but also to make good whatever it should be found expedient to take from the sinking fund to supply the necessities of the nation; meaning, that if, when a new loan of six millions was proposed, there should be one million in the hands of the commissioners, then the commissioners should take a million of the loan, and the *bonus* of that million should be received by them for the public, who would thus have only five millions to borrow. In the House of Lords, the other objection stated by Mr Fox was urged with some variation by Earl Stanhope, who expatiated on the danger which might occur, in future wars, of diverting the fund from its proper destination. But the bill nevertheless passed into a law without any alteration.

The establishment of a sinking fund appears to have been one of Mr Pitt's favourite schemes of finance; and, in fact, it was that which produced him the greatest degree of popularity; while, from his remaining in power during the long and expensive war which succeeded its establishment, it continued to be regularly and fully carried into effect. When a new loan was made, the minister not only proposed taxes sufficient to pay the annual interest of the new debt, but also to afford a surplus or sinking fund of one per cent. per annum, to be applied by the commissioners towards the extinction of the debt. It is almost superfluous to observe, that this scheme, from which such mighty results were anticipated, both by the political friends and opponents of the ministry, and which was loudly vaunted of as a monument raised to perpetuate his fame, is now known to every tyro in political science to have been bottomed on principles wholly fallacious; and the consequence has been, that some of its firmest supporters, having abjured the opinions which they originally entertained respecting it, afterwards united with those who had all along entertained sounder views, in putting an end to this expensive and cumbrous delusion, which had for a time imposed on the arithmetic as well as on the sense of the nation. The only effect of such a fund, when well contrived and steadily adhered to, seems to be, that it enables a nation to maintain its credit in difficult circumstances, and thus to carry on the accumulation of public debt to the highest possible amount, as well as to make trial in the completest manner of all the moral and political consequences of the funding system. We may add, that the project was not of Mr Pitt's contrivance; it formed only one, and that too not the most plausible, of three plans presented to him by Dr Price.

When the estimates for the navy were voted this year,

Reign of George III. some observations were suggested by Captain Macbride, which are worthy of being recorded, on account of their relation to the progressive improvement of the chief defence of the British islands. He censured extremely the voting of large sums of money for the repair of sixty and sixty-four gun ships; and observed that our having so many vessels of this sort was a principal reason of the many defeats we had suffered in the last war. The French had now not more than three or four sixty-four gun ships, and they took care not to build any new ones upon that construction. Another thing against our navy was, that the French seventy-four gun ships were of two thousand tons burden, while our seventy-fours had been reduced to sixteen hundred tons. Captain Macbride expressed his belief, that if the number of our ships were reduced one third, the navy of England would prove one third stronger. He condemned the system of suffering the ships to remain in their copper bottoms during time of peace; and contended, that if we persisted in this practice there would be no occasion to argue whether ships of one size or another should be built, for we should soon have no navy in our possession. The French had discovered the folly of the practice, and had for some time left off the mode of sheathing their ships. We ought therefore to do the same, or at least to take off the copper when the ships were to remain long in still water. The copper corroded and destroyed their bolts more than either worms or time; and hence, the instant the ships which had been long laid up in ordinary were sent to sea, their bottoms would drop out, and thousands of brave seamen would perish in the ocean. The ideas of Captain Macbride were confirmed by Sir John Jervis, and, as far as related to the sheathing with copper, by Captain Luttrell.

At this time the British nation, recovered from the effects of the war, was enjoying considerable prosperity. The administration of justice, proceeding in the ordinary course sanctioned by the constitution, produced its usual and natural effects of tranquillity and general satisfaction. The sovereign, in consequence of his domestic virtues and regular life, was personally popular. The members of administration had obtained their offices under circumstances which originally secured the good will of the nation; and no public events had occurred to expose their characters to any severe trial, or to produce an alteration in the public opinion regarding them. Still, however, the most distinguished members of the late coalition, continuing to hold seats in parliament, naturally wished to attract the public notice, and to rescue themselves from the neglect into which they had of late fallen. For this purpose they appear to have looked towards our Indian empire for materials upon which to exert their talents and to demonstrate their public spirit; and accordingly, during the present session, an attempt was commenced by Mr Burke to bring to trial and punishment Warren Hastings, late governor-general of Bengal, for crimes alleged to have been committed in that country.

There is something in the nature of the British constitution, or rather, perhaps, in that of every free state, which renders conquest, or even the acquisition of foreign territories, in any form, not a little inconvenient. In the case of the British American territories, a constitution less or more resembling that of Great Britain had been established in every colony or province; and these separate constitutions had produced abundance of internal prosperity to the colonies; but the whole formed a disjointed empire, slightly bound together by a limited executive power, and destitute of a common legislature; and an attempt, made by the legislature of the parent state, to make laws for the whole of the subordinate communities, gave rise to a war which ended in the dismemberment of

the empire. The remaining foreign possessions, such as Ireland and the West India islands, might be supposed to remain in union with the metropolitan country chiefly in consequence of their weakness, which rendered its protection necessary to their safety, or made them incapable of erecting themselves into separate governments in opposition to its will. But the territories which had been acquired by the British in India were, in this respect, in a very peculiar situation. It might perhaps have been possible, by an incorporating union, and an extension of the privilege of representation, to combine into one firm and consolidated government the whole British islands, together with the American colonies; but with regard to the territory of Hindustan, any thing of this kind was altogether impracticable. That great and fertile country, inhabited by men of a feebleness of race, and of different language, character, and religion, is incapable of being united to the British nation upon principles of equal political freedom. It had been originally acquired, not by a conquest made under the direct authority of the executive government of Britain, but by a company of merchants, who, by uniting the military superiority of Europeans with the arts of commercial men, contrived gradually to subjugate one of the fairest portions of the globe, containing a population many times greater than that of their native country. The progress of such a power towards empire was necessarily attended with the most cruel hardships to the natives of the subjugated country. When the mercantile invaders possessed abundance of European troops, they employed them in making direct conquests of additional territory; when these troops were exhausted by war or by the climate, or, having enriched themselves, had returned to Europe loaded with the spoils of the East, and left their former employers in that quarter in a state of considerable weakness, the servants of the Company then exerted their ingenuity to foment divisions among the native princes; and when they could no longer act as principals, they appeared as seconds in every quarrel, and obtained new territories as the reward of their insidious aid. With such views they formed and broke alliances without scruple; and, on receiving supplies of troops from Europe, they were never at a loss for pretences upon which to extend their dominion. All this was the natural result of the situation of the British East India Company with regard to the natives of Hindustan. But as the jealousy of the neighbouring states of Europe, together with their equal progress in the art of war, had long put an end to the extension of conquests, and produced much political moderation in the transactions of nations, many of the people of Great Britain learned with astonishment that their countrymen had conducted themselves in Hindustan in a manner which in Europe would have been regarded with abhorrence. Efforts, however, had been made to ameliorate as much as possible the government of India, by subjecting it, in a considerable degree, to the direct authority of the executive government of this country, instead of suffering it to remain totally vested in a company of merchants; and here it appears to have been wished that the affair should be suffered to rest, and that whatever was past should be overlooked and forgotten.

This, however, did not suit the present views of opposition. Mr Burke, in particular, had been led by an ardent imagination to interest himself deeply in the calamities suffered by the natives of India; and the policy of his party at this time coincided entirely with his feelings. Accordingly he endeavoured with much eagerness to bring to trial and punishment the most distinguished person who had recently figured upon the great theatre of Indian affairs. But great obstacles stood in the way of Mr Burke's proposed attempt to procure a parliamentary

Reign of George III. conviction of Mr Hastings. He had to overcome a long series of unpopularity, the personal indifference which had been shown to him by the House of Commons, and their indisposition so much as to give him a hearing, together with the coldness of the nation at large regarding complaints of East India delinquency. All these, however, he surmounted by efforts of the most obstinate perseverance, and of consummate eloquence, upon the fertile subject of cruelty, oppression, and treachery, committed under the authority of the British government in the East; the public attention was gradually attracted to the subject; and at last it formed the chief subject of conversation and of political discussion in all parts of the island.

Mr Hastings had arrived in England on the 16th of June 1785, and on the 20th of that month Mr Burke had given notice of his intention to move for an inquiry into the conduct of the ex-governor-general. On the day of the meeting of parliament, in January this year, Major Scott, the particular friend of Mr Hastings, publicly reminded Mr Burke of the menace he had thrown out, and requested Mr Burke speedily to decide upon the course he was to pursue. Accordingly, about the middle of February, this gentleman having resolved to proceed against Mr Hastings, by moving the House of Commons to impeach him at the bar of the House of Lords, endeavoured to prepare for substantiating the charges which were to be brought, by proposing that the house should order production of various papers; and motions to this effect were renewed by him at different periods. These motions gave rise to a variety of debates, in which Mr Dundas, who, as president of the board of control, now acted as minister for India affairs, together with Sir Lloyd Kenyon, master of the rolls, chiefly opposed Mr Burke, and threw considerable difficulties in his way. Mr Pitt appeared also to be favourable to Mr Hastings; but, upon the whole, he preferred assuming the character of a candid and impartial judge upon the occasion, affording neither protection to the accused nor favour to the accuser. At last, in the month of April, Mr Burke presented to the house his charges against Mr Hastings, twenty-one in number; and to these an additional article was afterwards added. The charges were of various degrees of importance; and some of them had sufficient weight to excite a considerable degree of public interest. Mr Hastings was accused of driving a whole people, the Rohillas, from their territory, without any show of cause for so doing; of arbitrarily confiscating the property of the native princes, and imprisoning them and their servants for the purposes of extortion; of entering into war with the Mahrattas without necessity, and treacherously delivering the Mogul into their hands on the conclusion of peace; together with a variety of other offences of minor importance. On the 26th of April Mr Hastings presented a petition, requesting to be furnished with a copy of the articles of impeachment, and to be heard in his defence against them before any witnesses should be examined. This request was at once granted; and Mr Hastings having appeared at the bar, stated the great efforts which he had made for the aggrandisement of the British power in the East, and entered into a defence of his conduct on the particular points upon which he had been accused. He asserted that the Rohillas were a tribe of adventurers, in driving whom from a usurped territory he had only assisted in performing an act of necessary justice; that the princes or princesses whose property he was accused of having seized for the use of the conquerors, had deserved their misfortunes by their treachery and rebellion; that the war with the Mahrattas had not been commenced by him; that the terms of the pacification were almost universally considered as advantageous; and that the Mogul having thrown himself into their hands, was entitled

to no protection from the British government. Upon the other points he in like manner asserted, not only the innocence, but the meritorious nature of his conduct, resting his defence chiefly upon such arguments as conquering princes usually employ to justify encroachments upon their weaker neighbours.

On the 1st of June Mr Burke brought forward in the House of Commons his first charge, which related to the expulsion of the Rohillas from their country, to the number of sixty thousand men, women, and children. On this occasion Mr Burke, exerting all his eloquence, represented the prosecution as not merely a question respecting the character of an individual, or brought forward for the purpose of inflicting a hardship upon him, but as a measure necessary for the establishment of the principle of responsibility with regard to the future governors of our distant possessions, and therefore as a national and imperial question, decisive of the good or ill government of millions yet unborn. He described, in interesting terms, the character of the Rohillas, the simplicity of their manners, the prosperity of their country, and their zeal for agriculture and commerce; and he denied that there existed any plausible ground to justify the assistance which Mr Hastings had given to one of their rapacious neighbours to expel them from their territory. After a debate, however, the house decided that this charge did not contain sufficient matter of impeachment against Mr Hastings. The next article of crimination against Mr Hastings was founded upon his alleged oppressive conduct towards Cheit Sing, the rajah of Benares. From this prince he had first arbitrarily demanded payment of a sum of money, in addition to the ordinary tribute, and, on the rajah delaying payment, imposed upon him a fine of half a million sterling; then he insulted him by an ignominious arrest, and thereafter expelled him from his dominions. This charge was opened with great ability by Mr Fox, and opposed by Major Scott and Mr Grenville, who inveighed against the rajah for his alleged unwillingness to support the British power in a dangerous crisis, and for the favour he had shown the schemes of its enemies. By this time the repeated discussion of the subject had begun to interest the public; and pamphlets were published, in which Mr Hastings' character was violently attacked, and as cagerly defended. His conduct as a governor-general of India, however, appeared to the majority of the people so totally inconsistent with those ideas of equity which regulate the opinions of men in this country, that a violent degree of popular indignation was excited against him. Hitherto, however, he had been supported in the House of Commons by those who usually adhered to administration; though Mr Pitt himself had on all occasions declared his wish to act candidly as a judge, and to avoid treating the matter as a question to be supported by a particular party. But upon this article of charge concerning the rajah of Benares he entered into the views of Mr Fox; and having declared himself satisfied that Mr Hastings had in this case acted unjustifiably, it was determined by a majority that the accusation contained matter of impeachment against the late governor-general of Bengal.

During this session some further provisions were enacted for the better regulation of the government of India. On the 7th of March a motion was made by Mr Francis, and seconded by Mr Windham, for leave to bring in a bill to explain and amend the act, formerly brought in and carried through by Mr Pitt, for regulating Indian affairs. Mr Francis censured strongly three different parts of Mr Pitt's act; first, that which establishes a double government of India at home, by the court of directors and the board of control; secondly, the excessive power, by means of a constant casting voice in the council, which was bestowed

Reign of George III. upon the governor-general of Bengal; and, thirdly, the institution of a special court of justice for the trial of Indian delinquents, which deprived such persons of the privilege of trial by jury. On the authority of Lord Macartney, Mr Dundas defended the powers conferred upon the governor-general of Bengal; and declared the necessity of a new court of judicature, from the voluminous nature of the evidence in the cases of Sir Thomas Rumbold and Mr Hastings, which could not be gone through by the ordinary form of jury trial. At the same time he stated it as his intention to bring forward a bill for amending, in certain respects, the regulating act of 1784. Mr Francis's motion was accordingly rejected; and on the 16th of March Mr Dundas brought forward his new bill for the regulation of India, which conferred still further powers upon the governor-general, authorizing him to act in opposition to the sense of his council when he thought fit to take the responsibility upon himself; united the offices of commander-in-chief and governor-general; authorized the board of control to inquire into the fortunes of persons serving in India; and divided the service there into different branches, declaring that the servants of the Company should rise by gradation only in those branches of service for which they had been prepared by their former habits. After a variety of debates in both houses, the bill was passed.

The session of parliament terminated on the 11th of July, and during the remainder of the year the British empire enjoyed profound tranquillity. An incident, however, occurred, which called forth demonstrations of attachment to the person of the king from all orders of men in the kingdom. On alighting from his carriage on the 2d of August, a woman approached his majesty, under the pretence of offering a petition, and at the same time aimed a thrust at him with a knife, which, however, did no harm. Being instantly seized, and examined by some members of the privy council, with the assistance of several medical gentlemen, this woman, whose name was Margaret Nicholson, proved to be insane, and was ordered to be confined for life in Bethlehem Hospital. A public thanksgiving was ordered for his majesty's safety, and addresses of congratulation poured in from all parts of the country.

One of the most important measures of Mr Pitt's administration was carried into effect in the autumn of this year. It consisted of a commercial treaty, which, as we have already stated, Mr Eden was sent to negotiate with France, and which was concluded on the 26th of September. This treaty stipulated, in general terms, that there should be a perfect liberty of navigation and commerce between the subjects of the two sovereigns in all their European dominions, with the view of giving fair encouragement to the produce and manufactures of both countries; and a particular tariff was adjusted with regard to a great number of commodities, while all articles which it did not include were to be reciprocally imported on the terms allowed to the most favoured nations. Each of the monarchs reserved the right of countervailing, by additional taxes on certain commodities, the internal duties imposed on the manufactures, or the import charges paid on the raw material; and it was also declared, that if either of the sovereigns should be at war, every thing should be deemed free which might be found in the ships of the respective nations, with the exception of goods usually deemed contraband, even though the whole or a part of the lading should belong to the enemies of the other state.

This treaty appears to have been acceptable to a considerable majority of the nation. When parliament assembled on the 23d of January 1787, it was announced in the speech from the throne, and formed the first subject of deliberation. When the usual address to the throne was moved, Mr Fox remarked that the treaty in question

ought to be examined with much jealousy, on account of its introducing an innovation into the established system of our policy; that all the wars of Great Britain had been wars of necessity; and that the jealousy of the power of France has been founded upon the fullest experience of her ambitious character. If this was a mere commercial treaty, the framers of it had only to prove that the new channel of trade which it opened would not obstruct, or would be more beneficial than, the other ancient channels which this kingdom had long been in possession of, and which had been found to be the sources of her commercial wealth and prosperity. But if, on the other hand, the treaty was intended as a political measure, and if ministers had in view such a close and intimate connection with France as would in future render it difficult for the two countries to go to war, strong and satisfactory reasons would be required for having pursued and concluded a measure so new in the history of this kingdom, and of such vast magnitude and importance. Mr Pitt reprobated the principles stated by Mr Fox, in as far as they went to sanction the policy of a constant animosity with France. Such a doctrine militated in the most direct manner possible both against humanity and common sense; for if war is the greatest of all evils, and commerce the chief blessing which a country can enjoy, it must be the duty of those to whom public affairs are intrusted, to endeavour as much as possible to render the one permanent, and to remove the prospect and danger of the other. This was the object of the present treaty; and the advantages likely to arise from it would operate upon succeeding administrations in both countries, so as to induce them to avoid a war as long as it could be done with honour and prudence, and would also strengthen the resources of this nation for carrying on hostilities whenever these should become indispensably necessary. This was the true method of making peace a blessing. The quarrels between France and Britain had not only continued to harass those great nations themselves, but had frequently embroiled the rest of Europe, and had disturbed the tranquillity of the most remote parts of the world. In time past they had acted as if they were intended by nature for the destruction of each other; but he hoped the period had now arrived when they would justify the order of the universe, and show that they were better calculated for the purposes of friendly intercourse and mutual benevolence.

On the 12th of February the house resolved itself into a committee for the purpose of considering the commercial treaty with France, when Mr Pitt entered into a full explanation and defence of the measure. He considered it in three points of view; as affecting our manufactures, our revenues, and our political situation. With respect to the first, he showed, that though the treaty had been formed upon principles of strict reciprocity, yet that this country must, from the very nature of the case, unavoidably have the advantage. With regard to the effect of the treaty upon the revenue, he remarked, that although a considerable reduction must undoubtedly take place of the duties upon French wines, and even upon Portuguese wines, should the provisions of the Methuen treaty be still kept in force, yet this would be balanced by the increased consumption, and by putting an end to the fraudulent manufacture of home-made wine, which was brought to market as foreign wine, a practice which no regulations of excise had hitherto been able to suppress. And with reference to the political tendency of the treaty, he recurred to his former observations on that subject, which it is unnecessary to repeat.

On the part of the manufacturers, it had been objected to this treaty, that the proposed intimate connection with France would afford opportunities of enticing away our

workmen, and conveying the tools and raw materials of our manufactures out of the kingdom. But to this it was answered, that the law in regard to these matters would remain as formerly, and afford to our manufactures the same protection as at present, by restraining the interference of foreigners in regard to the matters alluded to. It was also objected in general, that the commodities in which France traded, being the produce of her soil, which could not suffer in their quantity or quality by lapse of time, whereas our commodities being principally manufactures, which owe all their value to skilful and ingenious labour, the French might by degrees become as industrious and skilful as ourselves, and thereby enter into a successful competition with us in every branch of our present trade, whilst our soil and climate rendered it impossible for us to equal them in the articles of their produce. To this it was answered, that the different nature of the objects of British and French commerce was favourable to Britain, on account of the superior population employed in bringing our manufactures to market; and, at all events, that the threatened change could not occur in twelve years, which was the whole duration of the treaty. The members of opposition objected to the treaty chiefly upon political considerations. Mr Fox contended that the only situation in which Great Britain could stand, in the general system of Europe, with honour, dignity, or safety, was as a counterpoise to the power of France. Mr Francis reproached Mr Pitt with a desertion of the principles of his father Lord Chatham, the most prominent feature of whose political character was *Antigallicanism*. Mr Flood, Mr Sheridan, and others, expressed the same sentiments; whilst Mr Powis and Mr Alderman Watson opposed the treaty, as bringing the British commerce unnecessarily into hazard at a time when it was extremely prosperous. On the other hand, the treaty was defended by Mr Grenville, Mr Wilberforce, and Mr Dundas, and the resolution proposed by Mr Pitt was carried, on a division, by a large majority. In the House of Lords the treaty was warmly opposed by Dr Watson, bishop of Llandaff, and by Lords Loughborough, Stormont, and Porchester; but this opposition proved as unavailing as that in the lower house.

During the present session a plan for consolidating into one act of parliament the whole of the duties imposed by the statutes of customs and excise, was brought forward by Mr Pitt, and received the universal approbation of the House of Commons. The duties imposed upon French merchandise, in pursuance of the late commercial treaty, were also included in the same act, although that part of the measure was resisted by opposition.

On the 28th of March Mr Beaufoy, at the request of the deputies of the dissenting congregations about London, moved for the repeal of the corporation and test acts. He observed that the test act was originally levelled against the Roman Catholics, and the corporation act against those sectaries who had agitated the kingdom in the times of Charles I. and during the usurpation, but with whose character the dissenters of the present age had nothing in common; and he contended that, as every man had an undoubted right to judge for himself in matters of religion, he ought not, on account of the exercise of that right, to incur any punishment, or to be branded with what is undoubtedly a mark of infamy, an exclusion from military service and civil trust. He referred to the examples of Scotland, Holland, Russia, Prussia, and the dominions of the emperor, in none of which religious opinions were now made the ground of civil disqualification. Lord North spoke against the proposed repeal, chiefly on the footing of the hazard attending innovation. He denied that a man was subjected to any punishment because he did not choose to receive the sacrament of the Lord's Supper according to

the usage of the church of England. He only deprived himself of a privilege which he might otherwise enjoy, and which the law, for the safety of the church, had limited to persons of particular opinions. Mr Pitt supported the same view of the question, upon the ground of the danger to the established church which would result from intrusting official situations to dissenters. Mr Fox supported the motion in favour of the dissenters; remarking, however, upon this occasion, that, from their conduct in a late political revolution, he could not be suspected of being biassed by an improper partiality towards them. The motion was lost on a division by a majority of seventy-eight.

On the 20th of April Mr Alderman Newnham brought under the view of the House of Commons the pecuniary situation of the Prince of Wales, whose affairs had at this time fallen into a state of embarrassment. In 1783, when the prince came of age, Mr Fox and his colleagues, who were then in office, wished to grant him an annual income of L.100,000; but his majesty insisted that he should only be allowed one half of that amount. In the year 1786 the prince, having contracted a debt of L.100,000, exclusive of L.50,000 expended upon Carlton House, applied to his majesty to obtain relief from this incumbrance; and on receiving a refusal, he instantly dismissed the officers of his court, ordered his horses to be sold and the works at Carleton House to be stopped, and reduced his household to the scale of that of a private gentleman. By these savings an annual sum of L.40,000 was vested in trustees for the payment of his debts. But this decisive and spirited conduct was represented at court as disrespectful to the king; and from the period in question his majesty's dissatisfaction with the prince appears to have been no longer concealed. On the occasion of the assault made upon the king's person by Margaret Nicholson, no notice of the accident was sent by the court to the Prince of Wales; and when, on receiving the intelligence, he instantly repaired to Windsor, he was received there by the queen, but the king did not see him. In these circumstances the prince permitted his situation to be brought before the House of Commons, with a view of submitting his conduct to the judgment of the public. Accordingly, on the day already mentioned, Mr Newnham demanded of the chancellor of the exchequer whether ministers intended to bring forward any proposition for the relief of the Prince of Wales; at the same time alleging, that it would be disgraceful to the nation to suffer him to remain longer in his present reduced circumstances. Mr Pitt replied, that he had received no commands from his majesty upon the subject, and that without such it was not his duty to bring forward an affair of this nature. Mr Newnham then intimated his intention of bringing forward a motion on the subject upon the 4th of May. But on the 24th of April Mr Pitt requested to know the precise nature of the intended motion; stating his wish to avoid a discussion of the subject, and adding, that if it was persisted in, he would be under the necessity of bringing before the public some circumstances of extreme delicacy. At the same time Mr Rolle, an adherent of the ministry, declared that the question involved matter by which the constitution both in church and state might be essentially affected. This menace was believed to allude to an intimate connection supposed to subsist between the prince and Mrs Fitzherbert, a lady of a Roman Catholic family, with whom it was alleged that the prince had been married both by Catholic and Protestant clergymen, although such a proceeding, even if it had taken place, could be productive of no legal effects, in consequence of the provisions of the royal marriage-act. Mr Newnham replied, that his intended motion would be for an address to his majesty to relieve the Prince of Wales from his present difficulties; and when some members expressed a wish that

Reign of
George III.

the affair might be privately accommodated, Mr Sheridan declared, that after the insinuations and threats which had been made, the prince could not possibly recede with honour. Accordingly, on the 30th of April, when the subject was again mentioned, Mr Fox, who had been absent during the former debate, stated, that he had authority from the prince to say, that there was no part of his conduct which he would not willingly submit to public investigation. The allusions made to something full of danger to the church and state he treated as a tale fit to be imposed only on the lowest of the vulgar; and added, that his royal highness was ready, in the other house, as a peer of parliament, to give his majesty, or his ministers, any assurances or satisfaction on the subject which they might require. Mr Fox, at the same time, directly assured the house that the whole story alluded to was untrue. The result therefore was, that an accommodation took place. The prince was allowed an annual addition to his income of £10,000, and a sum of £180,000 was granted by parliament for the payment of his debts.

But the subject which chiefly occupied the attention of parliament during the present session was the accusation of Mr Hastings. After examining Mr Middleton and Sir Elijah Impey as witnesses in the beginning of February, Mr Sheridan, on the 7th of that month, opened the third charge against Mr Hastings, which set forth, that without justice, or any excuse of political necessity, he had seized the lands, and confiscated the treasures, of the begums or princesses of Oude, the mother and grand-daughter of the reigning nabob, and that he had even compelled the latter to become the instrument of this robbery. Mr Sheridan's speech lasted five hours and a half. The subject of the charge was well fitted for a display of all the powers of pathetic eloquence, owing to the rank and sex of the parties whom, on this occasion, Mr Hastings was accused of having treated with the most barbarous rapacity, treachery, and cruelty. Every advantage was taken of these circumstances by the eloquent accuser; and Mr Sheridan's discourse was considered as a model of splendid and impressive oratory. When he sat down, the whole house, which was filled with members, peers, and strangers, instantly joined in a loud and long-continued tumult of applause, expressing their approbation in the irregular mode of repeatedly clapping with their hands. Mr Burke declared it to be the most astonishing effort of eloquence, argument, and wit united, of which there was any record or tradition; Mr Fox said, that all that he had ever heard or read, when compared with it, vanished like vapour before the sun; and Mr Pitt asserted, that it surpassed all the eloquence of ancient or modern times, and possessed every resource which genius or art could furnish to control and agitate the human mind. After a short suspension of the debate, some of Mr Hastings' friends attempted to speak in reply, but found it impossible to procure a hearing. At last some members proposed, that for the sake of decorum, the debate should be adjourned; and this proposal was carried. On the following day Mr Francis resumed the charge, which was opposed by Mr Burgess, Major Scott, Mr Nichols, Mr Vansittart, and Mr Alderman le Mesurier. After having heard the arguments on both sides, Mr Pitt rose, and having stated the sense he entertained of the high importance of the procedure against Mr Hastings, and his endeavours to give to every fact stated in each particular charge the fullest investigation, declared himself fully satisfied that criminality was brought home to Mr Hastings, though not perhaps to the full extent alleged by the accusers. The motion for accusation was accordingly carried, upon a division, by a very large majority.

At a future period of the session other charges were

brought forward, and opened by Mr Thomas Pelham, Sir James Erskine, Mr Windham, and Mr Francis. Mr Pitt adopted the cause of the accusers, and on some occasions, though in a very mild tone, Mr Dundas did the same. At one period Lord Hood stood forward, and, in a very solemn manner, requested the attention of the house to the consequences of proceeding, with too scrupulous a nicety, to canvass the conduct of those who had filled stations abroad of high difficulty and important trust. Certain actions, which appeared to those at a distance in a very criminal light, were yet, he alleged, on a nearer investigation, perfectly justifiable on the grounds of absolute and indispensable necessity; and if the dread of an impeachment by parliament were to be hung over every commander in whose hands was placed the defence of our national possessions, it must necessarily operate as a dangerous restraint on their exertions, when it was considered that no general nor admiral had scarcely ever been fortunate enough to conduct himself in the performance of his duty, so as not occasionally to fall into circumstances in which the public service compelled him to do things in themselves neither pleasing to his feelings, nor strictly legal, but, from the indispensable necessities of their situation, perfectly justifiable. But Mr Pitt denied that these sentiments had any application to the case of Mr Hastings, since no adequate political necessity had been pointed out which could justify his conduct. In the course of the proceedings, also, it appeared that several members were disposed to consider the merits of Mr Hastings as in some measure compensating his crimes; and thus, although they voted his conduct criminal on particular occasions, they had an intention of voting in his favour when the general question should come to be proposed about the propriety of proceeding to impeachment. But Major Scott took an opportunity to declare that Mr Hastings and his friends wished to decline such a mode of defence; and he read to the house as a part of his own speech, a paper signed by Mr Hastings, in which he requested, if a general vote of criminality should pass against him, that they would further proceed instantly to an impeachment, and thus afford him an opportunity of defending himself judicially.

A committee was at length appointed to prepare articles of impeachment against Mr Hastings. It consisted of Mr Burke, Mr Fox, Mr Sheridan, Sir James Erskine, the Right Honourable Thomas Pelham, the Right Honourable William Wyndham, the Honourable St Andrew St John, John Anstruther, Esq. William Adam, Esq. M. A. Taylor, Esq. Welbore Ellis, Esq. the Right Honourable Frederick Montague, Sir Grey Cooper, Sir Gilbert Elliot, Dudley Long, Esq. Lord Maitland, the Honourable George Augustus North, General Burgoyne, and Mr Grey. An attempt was made by Mr Burke to procure the appointment of Mr Philip Francis as a member of this committee, but without success. On the 25th of April Mr Burke presented the articles of impeachment, which were read, and ordered to be printed, and considered on the 9th of May. Upon that day Lord Hood repeated his former arguments, and was supported by Mr Smith and the notorious John Wilkes. This last person insisted strongly on the silence of the natives of India respecting the dreadful oppression said to have been practised against them, and attributed the greater part of what appeared criminal in the conduct of Mr Hastings to the craving and avaricious policy of this country, whose demands had in some instances driven Mr Hastings to the use of means not strictly justifiable. The amount of the charges, supposing the facts to be true, was, in his opinion, this, that Mr Hastings, by oppression, by injustice, and by corruption, had obtained for the East India Company nine millions and a half sterling. Mr Wilkes thought

gn of the acts complained of politic and just, and declared that he could not vote for the impeachment of Mr Hastings, while he benefited by his misdeeds. He added, that it appeared incomprehensible to him how gentlemen who condemned his actions suffered a day to pass without proposing retribution to the sufferers. The lord advocate of Scotland, Mr Hlay Campbell, also supported this view; considering the necessities of the Company, and the dangerous crisis of their affairs, as grounds of justification for the strong measures pursued by Mr Hastings, in order to extricate them; and declaring that, as the Company had actually reaped the benefit of them, and so far approved of them as never to signify any intention of restitution, he could not conceive with what propriety Mr Hastings could be impeached. Mr Pitt acknowledged that many measures during the administration of Mr Hastings were uncommonly brilliant, and that in these his merits were unquestionable; but he trusted that no man who seriously regarded the honour of the House of Commons would think that the justice of the country could admit of any compromise whatever.

The question of impeachment was therefore carried by a large majority; and on the 10th of May, at the bar of the House of Lords, Mr Burke, in the name of the House of the Commons of Great Britain, impeached Warren Hastings, Esq. late governor-general of Bengal, of high crimes and misdemeanors; and informed the Lords that the Commons would, with all convenient speed, exhibit and make good articles against him. On the 21st of the same month, upon the motion of Mr Burke, Mr Hastings was taken into the custody of the serjeant at arms of the house; but he was immediately admitted to bail by the House of Lords, himself in the sum of L.20,000, and two sureties in L.10,000 each. But as the session of parliament was prorogued on the 30th of May, the trial was necessarily postponed to another session, and by various delays it was ultimately protracted to an extraordinary length.

The impeachment of Mr Hastings, from the attention which it excited, and the talents which were exerted in carrying it through, undoubtedly forms an event of considerable importance in British history. It ended in the acquittal of the party accused; but the immense expense which he incurred, and the uneasiness which he must have suffered from the odium excited against him, unquestionably amounted to a very severe punishment. A British House of Commons held him guilty of inhumanity, rapacity, perfidy, and tyranny, towards a numerous and civilised people, who had been subjected to his power; and these sentiments were so widely diffused throughout Great Britain, that the minister of the day, always studious of popularity, thought it necessary to join in the general current of opinion. But to enable the reader to appreciate correctly the merits of Mr Hastings, or the reasonableness of the accusations which were brought against him, it is necessary to consider correctly the situation in which that gentleman stood. He was invested by the British East India Company with absolute power over a large portion of Hindustan, in order to govern for the profit of the Company, and if possible to acquire for them still more extensive territories. To fulfil the purposes for which he was employed, it was necessary for him to procure a large revenue for the Company, and at the same time to enable the young men of rank, whom they sent out in their service, to return speedily to Britain loaded with wealth; these being the only objects on account of which the East India Company, or the British nation, had made efforts for the conquest of the East. But such objects evidently imply, not that Hindustan was to be mildly and generously governed, but that it was to be plundered to the utmost

extent which it could bear without ruin. Accordingly, in 1782, Mr Hastings, in one of his letters, complained strongly of the cruelty of his situation, and of the expensive establishments and offices which he was under the necessity of constituting in India, in order to gratify the avarice of his employers; declaring that he had at that time about him two hundred and fifty persons, the younger sons of the first families in Britain, all looking up to him for patronage, and expecting to be put in possession of sudden riches. But these riches, it is evident, could not be drawn from the natives of Hindustan without much oppression; and when this oppression produced rebellion, or combinations of the native princes against the British power, it became necessary to be guilty of further oppression, or more grievous extortion, to collect means by which to overcome the resistance of an oppressed people. It is admitted on all hands that Mr Hastings was almost unboundedly successful in the service of his employers. He sent home annually great numbers of men loaded with the plunder of the East; while at the same time, by great activity and intrepidity, he collected resources wherewith to maintain and extend the British power, and was enabled to support it in all quarters against the most extensive combinations of the princes of that country. Now there are two systems of morality according to which the character of such a man as Mr Hastings may be tried. The one is founded upon the principle of obedience to his employers, and fidelity to the trust reposed in him; and the other upon the eternal law of humanity. According to the first of these, that conduct is most worthy of applause which tends in the highest degree to promote the interest of those whom we serve; and, considered in this point of view, the merits of Warren Hastings have seldom been surpassed. It is true that he plundered the provinces of the East; but it was to aggrandise and enrich his country that he did so. He accounted their persons and fortunes as of little consideration; but he did so because he was the devoted servant of Britain. Accordingly, the French, whose public enemy he had been, regarded him with admiration, and uniformly extolled his actions as more than human. But if, in opposition to all this, we are to weigh the conduct of Mr Hastings by those maxims of morality which assume the immutable law of humanity as the rule by which human actions ought to be regulated, there can be no doubt that he must be condemned. He can only be regarded as one of those robbers of nations, to whose crimes historians and poets have given a too fatal celebrity. He was guilty of plundering and oppressing a pacific race of men, at the extremities of the earth, in whose affairs neither he nor his country had any right to interfere. But the principal criminals in this case were the British East India Company, the British legislature, and the British nation, who sent him upon such a service. Mr Hastings was only the guilty tool of a guilty people; and surely it ill became the British House of Commons, which had authorized the acquisition of conquests, or, in other words, sanctioned rapine and oppression, in the East, and whose constituents had become rich by the plunder or the profits of such enterprises, to accuse as a criminal the most successful servant of the state. John Wilkes and the lord advocate for Scotland appear, therefore, to have rested Mr Hastings' defence upon an unanswerable footing, when they considered his crimes as services, which he was employed by his country to perform for its aggrandisement, and for the moral rectitude of which he could not be responsible to that power from which he derived his commission, and which scrupled not to reap the fruit of his labours.

During the year 1787, the amity subsisting between Britain and France seemed likely to be disturbed, in consequence of the affairs of Holland. The grounds of dif-

Reign of
George III.

ference, indeed, were speedily adjusted; but the events out of which they arose are worthy of notice, on account of their tendency to explain some future occurrences in the history of Europe. The state of the Dutch republic always had been regarded as of much importance by Great Britain. That country, being situated upon the mouths of the navigable rivers which communicate with some of the most important parts of the European continent, holds as it were the keys of the different passages by which our manufactures reach their places of ultimate sale and consumption; and in the most important efforts for reducing the power of France, the Dutch had acted along with the British nation. In the history of the United Provinces, during a couple of centuries, two parties were always found struggling for superiority. The one was that of the house of Orange, which had been originally raised to power in consequence of the talents of its chiefs, united with their rank and property, which had induced the states to intrust to them the direction of their armies, first against the Spanish monarchy, from which the united provinces had originally revolted, and afterwards against the power of France. By their great public services, the princes of the house of Orange had established in their own favour a kind of hereditary claim to the offices which they held in the republic, of stadtholder, captain-general of the forces, and admiral; and thus there existed in their persons, in succession, a kind of limited monarchy, by which the Dutch republic was influenced and led, rather than formally governed. The second party in the Dutch republic consisted of a kind of aristocracy, composed of the senates or town-councils of different cities, which possessed the power of nominating to the vacancies in their own order, that is, of electing their own successors in office. This party was usually denominated the Party of the States, or the Republican Party. Its members were, in point of form, the sovereigns of the country, as well as the wealthiest individuals in it; and the chief constitutional control which the stadtholder possessed over them, was founded on a regulation established by William III. prince of Orange, in 1674, by which he enjoyed a negative in the elections of town governments, and a power, in certain cases, of introducing members into them. But it is to be observed, that the mass of the people, who always find greater safety under the dominion of one superior than under that of a multitude of petty local chiefs, were decidedly attached to the house of Orange, or to the power of the stadtholder, in opposition to that of the town senates or republican party; and the ancient nobles also, together with the clergy of the established church, and the officers of the army and navy, adhered to the same family, and thereby enabled it on ordinary occasions to support its power against the party of the states.

During the participation of the United Provinces in the late war against Great Britain, a proposal had been made to enrol bodies of volunteers in the different towns, for the purpose of internal defence. The senates of the towns, that is, the aristocratical, or, as they called themselves, the republican party, encouraged the formation of these armed bodies of burghers, over whom at their first enrolment they had complete influence, as affording them a kind of counterpoise against the military power, which, although paid by them, was commanded by the stadtholder. But these bodies of citizens, as soon as they had been trained to the use of arms, began to be sensible of their importance. The opinions propagated in North America during the war were known over all Europe, and being received with considerable avidity by the Dutch volunteers, produced in that country a kind of third or democratic party, the object of which was to procure for the citizens of the towns a share in the nomination of the magistrates. But as the

volunteer associations were originally the creatures of the senates or aristocracy, for the purpose of counteracting the power of the stadtholder, so they appear, in their first movements, to have been directed by that faction. One of these movements took place at Utrecht. The armed burghers, amounting to upwards of two thousand, presented a petition to the states of the province of Utrecht, requesting them to abolish the regulation of 1674, by which the stadtholder was enabled to influence the nomination of the magistracy; and they presented an address of a similar nature to the town senate of Utrecht, and to the prince of Orange. As might have been expected, the answer of the prince was unfavourable; but the magistrates of Utrecht, in compliance with the wishes of the armed burghers, proceeded to fill up a vacancy in their own number without consulting the prince. This event occurred in January 1784; but it appears that, in the course of the same year, either from the intrigues of the stadtholder's court, or a dread of betaking themselves to the assistance of the new and dangerous democratic party, the states of the province and town senate of Utrecht deserted the cause of the armed burghers, whom they themselves had instigated to action, and recalled or annulled the steps towards innovation which they had previously taken. Meanwhile the senate and the armed burghers continued alternately to menace each other. But, by degrees, a spirit of political reform diffused itself from Utrecht to the different towns in the provinces where bodies of volunteers or armed burghers had been established. The armed burghers of Utrecht elected a representative body to watch over the management of public affairs, and various other towns followed the example; but these representative bodies soon quarrelled with the old senates; and the prince of Orange appears to have had it in his power to select either of the parties he might think fit as his adherents. His ancient enemies were the aristocracy or town senates; but as he could not, without a total alteration of the constitution of the United Provinces, derive a regular and legal support from the bodies of armed burghers, he resolved to support the ancient magistracies, and to rest his power upon its former footing of influence over these magistracies, though he knew them to be his rivals in political importance. It would seem, however, that the aristocracy of the province of Holland, who had always been the most decided enemies of the family of Orange, were not satisfied with the disposition of the prince to support the ancient constitution, and resolved to undermine or overthrow his power, even at the hazard of a revolution, which must be equally fatal to their own. But this aristocratical body was not of an enterprising character, and rather waited than attempted to direct the course of political events; while, in consequence of the support afforded by the stadtholder to the senates of Utrecht and other places, the armed burghers throughout the whole United Provinces became disposed to act in opposition to him. Meanwhile the populace of the Hague retained their usual attachment to his person and family. On the 4th of September 1785, twelve volunteers of the corps of the town of Leyden appeared at the Hague in uniform. Offended by this apparent defiance, the populace attacked and drove them into a neighbouring house, the windows of which they smashed; but a part of the garrison, without interfering with the populace, took the volunteers into custody, and sent them home privately by night. This riot, however, served as a pretext to the states of Holland for superseding the prince of Orange in the command of the garrison at the Hague, which they intrusted to the deputies of Haerlem, a town long noted for its zeal in opposition to the stadtholder; and as the prince had been engaged in endless controversies with the states of Holland, in which the strength

Reign of George III. of the aristocratical party was concentrated, this affront drove him to the resolution of leaving the Hague, which he did on the 14th September 1785. He applied for protection to Great Britain, whose cause he had uniformly supported, and to the king of Prussia, who was the uncle of his wife. The aristocratical party, on the contrary, made application to the court of Versailles, which it had supported by entering into the confederacy against Great Britain, and from which it had always received encouragement; and at the same time it endeavoured to effect a union with the armed burghers.

In the mean time Frederick II. of Prussia died, and was succeeded by his nephew, Frederick William, the brother-in-law of the stadtholder. The French court appeared to espouse with vigour the combined aristocratical and democratical parties in the United Provinces; but the new king of Prussia hesitated to engage in a dispute with France; and there is little doubt that, had the French on this occasion shown themselves ready to act with vigour in support of their party in Holland, the stadtholder must have fallen before his enemies. But the French monarchy, under a benevolent and well-meaning though weak prince, was at this period rapidly sinking into a state of great feebleness, owing to the extreme embarrassment of its finances. A negotiation was indeed proposed between the courts of France and Berlin, for the purpose of adjusting, in some friendly manner, the differences between the stadtholder and his enemies. But the weakness of France becoming gradually more apparent, Prussia and Great Britain were induced to take a more decisive part in the affairs of Holland, chiefly in consequence of the suggestions of the British ambassador at the Hague, Sir James Harris. The stadtholder, who had now established himself at Nimeguen, was a man of little activity or enterprise; but his princess being of a different character, ventured to undertake a journey to the Hague, unaccompanied by her husband, probably with a view to what actually happened. On the 28th of June 1787 she was arrested by some troops of the opposite party; and this circumstance afforded an excuse to the king of Prussia for interfering in the internal affairs of the United Provinces, in order to demand reparation for the insult offered to his sister.

A Prussian army, commanded by the Duke of Brunswick, the brother-in-law of the king of Great Britain, immediately prepared to invade Holland; and to secure additional aid to the Prince of Orange, a treaty was concluded between Great Britain and the landgrave of Hesse-Cassel, for the assistance of twelve thousand troops. In the mean time the United Provinces remained in a state of great internal distraction. The defects of their political constitution had originally occasioned the appointment of a stadtholder; and there had yet been substituted in its stead no simple system, which, by doing away the distinctions of states and provinces, might unite the force of the country, for the purpose of enabling it to resist such powerful aggression as that with which it was now threatened. The promised aid from France did not arrive; and although troops had been levied by the states of Holland, the chief command of them was intrusted to the rhingrave of Salm, a man whose character appears to have inspired little confidence. Meanwhile the Duke of Brunswick, at the head of a powerful army, entered the country. The reputation of the Prussian armies in Europe was at this time extremely great; and the frontier towns of Holland, which were capable of resisting regular sieges, were now taken without a struggle. It is unnecessary to detail the progress of the Prussian troops, which was extremely rapid, since in little more than a fortnight the republican party found itself confined to the city of Amsterdam. This city was besieged on the first of October; and after much negotia-

tion, and a variety of attacks, it admitted a foreign garrison to take possession of its gates. The influence of France was thus totally annihilated in Holland, and the authority of the stadtholder restored; but it was restored by the power of Prussia and Britain alone; and the consequence was, that a decided enmity to these two countries, from that period, took possession of the minds of a great portion of the inhabitants of the Dutch territories.

When the British parliament met on the 27th of November 1787, the most remarkable circumstance alluded to in the king's speech was the state of Holland. It was there mentioned, that the disputes in the republic of the United Provinces had become so critical as to endanger their constitution and independence; that his majesty had endeavoured by good offices to maintain the lawful government of those countries, and judged it necessary to explain his intention of counteracting forcible interference on the part of France; that, accordingly, when his most Christian majesty, in consequence of an application for assistance by the party which had usurped the government of Holland, had notified his intention of granting their request, his majesty had declared that Britain could not remain an unconcerned spectator, and immediate orders had been issued for augmenting the forces both by sea and land; that the rapid success of the Prussian troops having soon after enabled the provinces to re-establish their lawful government, an amicable explanation had ensued between him and the most Christian king; and that both parties had engaged to disarm, and to place their naval establishments on the same footing as at the beginning of the year. When the address was moved, Mr Fox took an opportunity of expressing the fullest approbation of the measures which had been lately pursued, and took credit to himself as one of those who had invariably been of opinion that this country is at all times deeply interested in the situation of affairs upon the Continent, and ought, whenever occasion required, to take an active and vigorous part in preserving the balance of power in Europe. In the House of Lords the Bishop of Llandaff also expressed his satisfaction at seeing the republic of the United Provinces again united in its views with Great Britain.

During the interference of Great Britain and Prussia in the affairs of Holland, and whilst a dread was entertained that the discontented party in the provinces might receive assistance from France, and preparations were on that account made for fitting out a fleet, the lords of the admiralty had promoted sixteen captains of the navy to the rank of admirals. In this promotion a selection had been made, by which upwards of forty senior captains were passed over; a circumstance which gave rise to various debates in parliament. To understand the subject, it is necessary to remark, that in 1718 an order of council directed the lords of the admiralty, in promoting officers to the rank of admirals in the navy, to prefer the senior captains, providing only that they were duly qualified for the rank to which they were to be promoted. And by a subsequent order of 1747 the lords of the admiralty were authorized to place such captains as should be found incapable, by reason of age or infirmity, of serving as admirals, upon the list of superannuated admirals, usually called the list of the yellow admirals. In the promotion above mentioned the board of admiralty had offered to place upon the list of yellow or superannuated admirals most of the captains who were passed over; but these, from their capacity for future service, conceiving themselves entitled to the rank of acting admirals, had refused the retreat which was offered them; and a general disgust prevailed among the officers in the navy, on finding that their hopes of employment in active service must at all times depend on their interest with the first lord of the admiralty. On the 20th of February

Reign of George III.

Reign of
George III.

1788 Lord Rawdon, in the House of Lords, stated their case, and proposed an address to his majesty upon the subject. But the first lord of the admiralty, Lord Howe, justified the exercise of a discretionary power by the board in promoting navy captains to the rank of acting admirals, upon the ground that a man might be fit to command a single ship who ought not to be intrusted with the care of a fleet; and Lord Sandwich admitted the impropriety of interfering with the executive government in an affair of this nature; upon which Lord Rawdon's proposal was rejected. The same subject was also brought before the House of Commons in various forms, and supported by almost all the naval officers who had seats in the house. But Mr Pitt defended the admiralty, by declaring that no degree of misconduct had been stated sufficient to authorize the interference of parliament with the exercise of its powers; and the board was protected from censure by a small majority.

At this time a bill was brought into parliament for subjecting to higher penalties than formerly all persons who should export wool from the country, the object of it being to confirm the monopoly enjoyed by our own manufacturers in that article. The manufacturers asserted, that thirteen thousand packs of British wool were annually smuggled into France, which tended to raise the price of the commodity against our own manufacturers. Several country gentlemen, however, opposed the bill, as an unjust hardship upon the profits of land in this country, which ought to have the world open as a market for its productions; but the minister, who was aware of the importance of enjoying popularity with the commercial part of the nation, gave full countenance to the bill, which accordingly passed into a law.

In his financial exposition of the revenue, Mr Pitt made some remarks as to the improving state of the country, which are not unworthy of being noticed. He stated that the receipt of the permanent taxes, in the year 1787, exclusive of the land and malt tax, had been L.13,000,000, whereas the receipt of the taxes in the year 1783 had only been L.10,184,000. Thus there was an increase of revenue amounting to three millions, of which not more than one million and a half accrued from new taxes. In trade, navigation, and fisheries, the progressive improvement had kept pace with the increase of revenue. In the year 1772 the imports were L.14,500,000, and the exports L.16,000,000; in 1787 the imports were about L.15,800,000, and the exports amounted to L.16,600,000. Navigation had in like manner increased. The Newfoundland fishery in 1773 produced 516,000 quintals; but in 1786 it produced 732,000. In 1773 the Greenland fishery gave employment to 27,000 tons of shipping; but in 1786 the amount employed was 53,000. The southern whale fishery, a new and valuable branch of trade, which only commenced at the beginning of the last war, had also prospered equally. In this fishery, in 1785, there were employed eighteen ships, producing L.20,000, whereas in 1787 there were employed thirty-eight ships, producing L.107,000. The general result, therefore, showed that the commerce and industry of the country were in a prosperous condition, and extending themselves in every direction.

On the 8th of June Mr Pitt called the attention of the house to the compensation which was intended to be made to the American loyalists, on account of the losses sustained by them from their adherence to this country during the American war. He divided the loyalists who had made claims of compensation into four classes. In the first class he ranked those who had resided in America at the commencement of the war, and who had been obliged to abandon their estates and property, which were seized and confiscated by the Americans, and he proposed

that loyalists of this class who had not lost more than L.10,000 should receive full compensation; for losses above that sum, and below L.35,000, ninety per cent. on the excess above L.10,000; for losses above L.35,000 and under L.50,000 eighty-five per cent. on the excess above L.10,000; and for losses above L.50,000 eighty per cent. on all above L.10,000. The next class of claimants, consisting of those who had lost property in America, but who had resided in England during the war, Mr Pitt proposed to indemnify also in full to the amount of L.10,000; but that all whose claims amounted to from L.10,000 to L.30,000 should suffer a deduction of twenty per cent., and a further additional deduction of twenty per cent. in progression upon every additional L.50,000 claimed. Of the third class of claimants, consisting of loyalists who had enjoyed places and exercised professions in America, which, by adhering to this country, they had lost or been forced to abandon, he proposed to put upon half pay those whose incomes amounted to no more than L.400 per annum, and to grant forty per cent. upon any excess of income above L.400 per annum, unless the income exceeded L.1500 per annum, in which case thirty per cent. only was to be allowed upon the excess of income above L.400 per annum. Lastly, it was proposed to pay the full amount of their claims to persons connected with West Florida, because, by the treaty of peace, that country had been ceded by Britain to a foreign power. Mr Pitt concluded by moving, that, in order to satisfy these claims, L.1,228,239 should be voted to the several American claimants, and L.113,952 14s. 3d. to the Florida claimants; and the motion was unanimously agreed to. The liberality with which the British nation acted upon this occasion merits high approbation, as an instance of the wisest policy, from its tendency, in future discontents or insurrections in the subordinate parts of the empire, to secure the attachment of persons of property to the cause of the mother country. As the claims of the American loyalists were stated by themselves, and not scrutinized with extreme severity, it was generally understood that these persons were in very few instances ultimate losers by the part which they had taken; a circumstance of which the public did not disapprove.

The trade carried on by Great Britain and other European nations upon the coast of Africa, for the purchase of negro slaves to be employed in the cultivation of the West India islands, and certain parts of the continent of America, does not appear to have been at this time considered with that general attention which a practice so abhorrent in its nature to the mild principles of modern policy and manners might have been expected to excite. This may probably have been owing, partly to the distance of the object, which tended both to conceal the sufferings, and to lessen the sympathy of the public for the unfortunate sufferers; and partly to the connivance of politicians, unwilling to examine too severely into the nature of the means by which distant colonies were enabled to pour luxury and wealth into the bosom of the mother country. The first public attempt made to put a stop to this traffic was by the Quakers of the southern provinces of America, who, soon after the establishment of their independence, not only presented a strong and pathetic address to their several legislative assemblies on this subject, but actually proceeded in many instances to emancipate the slaves in their own possession. In Great Britain the same sect appears also to have taken the lead; and, after the example of their American brethren, they presented, in 1787, a petition to the parliament of this kingdom. The cause soon afterwards became extremely popular, and was taken up with great zeal and earnestness by various descriptions of people. A society was formed; a considerable sum of money was subscribed for the purpose of collecting infor-

Rea of Geo. III. mation and supporting the expense of an application to parliament; a great number of pamphlets were published upon the subject; several eminent divines recommended the abolition from the pulpit and in printed discourses; and, in the present session, petitions against the slave-trade were presented from the two English universities, and from several of the most considerable towns and corporations in the kingdom. By a sort of general consent, Mr Wilberforce had been intrusted with the care of bringing the business before the House of Commons; but he being prevented by ill health, Mr Pitt, on the 9th of May, proposed that the house should come to a resolution to take into consideration the circumstances of the slave-trade early in the next session. He added, that the privy-council had appointed a committee to inquire into the matter, and that next session the result would probably be laid before the house to facilitate their investigations. Mr Fox and Mr Burke expressed their regret on account of the proposed delay; lamenting that the privy-council, who had received no petitions from the people, should have instituted an inquiry, and that the House of Commons, whose table was loaded with them from every part of the kingdom, should not have instituted an inquiry at all. Sir William Dolben called the attention of the house to the condition of the slaves in that intermediate state of misery which they suffered in their transportation from the coast of Africa to the West Indies, entering into a short detail of the horrors of the middle passage, and declaring himself ready to bring evidence to the bar to prove the fact. This called aloud for a remedy, and that remedy ought to be applied immediately; for if parliament delayed doing so, ten thousand lives would be lost between the present session and the beginning of the next. This suggestion met with general approbation; and a bill was accordingly brought in and passed into a law for regulating the transportation of the natives of Africa to the British colonies in the West Indies.

During this session the affairs of India still continued to occupy the attention of the legislature and of the public. Under the apprehension of a rupture with France on account of the affairs of Holland, government had resolved to send out four additional regiments to India, on board the Company's ships, for the protection of our possessions in that quarter; and the proposal had been received with approbation by the court of directors; but even after the danger was past, government still adhered to their resolution of sending out these regiments, with a view to form a permanent establishment of king's troops in that quarter of the world. Hence a question arose with the court of directors of the East India Company, about the expense of sending out, and afterwards paying, these troops. By an act passed in the year 1781, the Company were declared liable for the expense attending such troops only as should be sent out upon their own requisition. But administration now contended, that the act brought forward by Mr Pitt in 1784, which gave to the board of control a power of counteracting the orders of the court of directors, and of directing the application of the Company's revenues, ought to be understood as authorizing that board to carry into effect the proposed measure. The court of directors, however, having obtained the opinion of some eminent lawyers in their favour, refused to take the troops on board the ships which were about to sail for India; and for this reason, on the 25th of February, Mr Pitt proposed, in the House of Commons, that all difficulties should be removed by a declaratory act, stating the intention of the legislature, in the act of 1784, to have been conformable to the construction put upon it by the board of control. This mode of proceeding was strongly opposed, upon the grounds that the claims of government upon the Company ought to be tried in a court of law, instead of being brought be-

fore the House of Commons, where administration possessed an undue influence; that the measure was in itself ill judged, as it would have been more economical to permit the Company to raise four regiments, which would have enabled them to provide for many of their own officers, who were living in India in very distressed situations, in consequence of having been reduced at the peace; and that the mode of sending out recruits to complete the king's regiments at that time in India might have been adopted with more advantage to the Company, as it would have enabled them to avoid the additional burden of all the officers of four new regiments. But the point on which the declaratory act was chiefly resisted referred to its tendency to deprive the East India Company of the management of its own affairs, and of the patronage arising from its revenues, which, at the time when Mr Pitt's bill was passed, had never been understood to be the intention of the legislature or of government. Mr Pulteney, and some other members who usually voted with Mr Pitt, now declared that they supported his bill in 1784 only because it appeared to preserve uninjured the rights of the East India Company; and that the construction attempted to be put upon it in the declaratory act rendered it fully as obnoxious as the celebrated bill rejected by the Lords in 1783; with this difference only, that what the one had for its professed object only and without disguise, the other was attempting to effect by fraud and dissimulation. Other members also expressed similar sentiments, which excited great triumph on the part of Mr Fox and his friends, who loudly congratulated themselves upon the complete justification which his India bill had now obtained, by the tacit confession of his adversaries themselves. In support of the declaratory act, Mr Pitt contended, that the express object of the institution of the board of control was to take the entire management of the territorial possessions and the political government of India out of the hands of the Company, leaving them only the direction of their commercial concerns; that the board of control was in future to be responsible to the public for the prosperity and safety of our Indian possessions, and was therefore to be invested with the powers necessary for the due discharge of its important duties; and that administration in 1784 had not held any other language with regard to its nature, or the authority which it was to possess. On the 5th of March the bill was passed by a considerable majority. In the House of Lords the Marquis of Lansdown opposed it on nearly the same grounds as had been urged in the Commons, but with as little success. And upon the whole, if the augmentation of the power of the crown was at this period a misfortune, it was a misfortune which the conquest of India appears to have rendered inevitable. The East India Company, by whom the conquest had been made, was admitted to have shown itself unfit to govern that great country. The management of it, therefore, naturally devolved upon the executive government, unless the constitution itself was to be endangered, by intrusting the exercise of new and unusual powers to some branch of the legislature; or, unless a new kind of authority or power was to be created, like that attempted by Mr Fox's India bill, the result of which, as a political experiment upon the constitution, or mode of administering part of the affairs of the empire, was necessarily hazardous, because heretofore entirely without example in our history.

The attention of the nation still continued to be occupied in no small degree by the prosecution of Mr Hastings. The members of the committee which during the preceding session had prepared the articles of impeachment, were now appointed to act as managers for the House of Commons in conducting the trial; and on the

Reign of
George III.

13th of February the trial commenced with extraordinary solemnity in Westminster Hall, which had been fitted up for the purpose. At an early hour the Commons, preceded by the managers, issued from their own house into the hall, Mr Burke leading the procession; and thereafter came the Peers in procession, preceded by the clerks of Parliament, the masters of chancery, the serjeants at law, and the judges. That and the following day were consumed in reading the articles of impeachment, and in receiving the answers of Mr Hastings. On the 15th of February, Mr Burke began an oration, which he continued during that and the four following days, and in which his talents were exerted with great splendour, and his eloquence listened to with admiration. After an appeal to the justice of the court on the part of the people of India, he entered into a detail of the history of Hindustan from the earliest times; sketched a luminous outline of the revolutions which had occurred in it, of the civil and religious institutions, with the arts, customs, and manners of the various classes of its inhabitants; traced the progress of British intrusion, and minutely described the establishments effected by our countrymen; gave an animated account of the blessings which India might have derived from communication with the most enlightened nation in Europe; lamented that, instead of acting as friends or instructors of the natives, our countrymen had marked their way by treachery and rapine, and taught vice rather than virtue; expatiated on their usurpations of power, and their frequent enormities; specified the acts of Mr Hastings, representing them as beyond all bounds arbitrary and rapacious, and endeavoured to hold him up to execration as a monster of tyranny. The governor-general had attempted to justify his oppressions, by asserting that the Asiatic governments were all despotic; that he did not make the people slaves, but found them such; that the sovereignty he was called to exercise was an arbitrary sovereignty; and that he had exercised it in no other way than was done by the other sovereigns of Asia, and the native princes of the country. Mr Burke reprobated this geographical morality, and these claims to absolute power; denied that either the East India Company or the British government had it to bestow; asserted that no such arbitrary government was attempted to be justified in the East, every Mahomedan government being regulated by the laws of the Koran, while those of the Gentoos proscribed the idea of arbitrary will in magistrates; and contended that the conduct of tyrants, or the corrupt practices of mankind, were no principles upon which to regulate the duty of a British governor, bound to act, and liable to be judged by his country, upon British principles. Mr Burke concluded by declaring, that he impeached Mr Hastings in the name of the Commons of Great Britain, whose parliamentary trust he had betrayed, and whose national character he had dishonoured; in the name of the people of India, whose laws, rights, and liberties he had subverted, whose properties he had destroyed, and whose country he had rendered desolate; and in the name of human nature, which he had cruelly outraged in both sexes, in every age, rank, and condition of life.

The managers of the impeachment next proposed that they should come to a conclusion on both sides, upon each article separately before they opened another; but the counsel for Mr Hastings insisted that the House of Commons ought first to proceed to a conclusion upon the whole charges, before any part of the defence was demanded; and the House of Lords having deliberated on the point, decided it in their favour. The managers for the Commons acquiesced in the decision, and entered upon the particular charges, two of which employed the House of Lords during the remainder of the session.

During the investigations occasioned by the trial of Mr Hastings, and the discussion of India affairs, the opposition were led to bring forward a series of charges, importing high crimes and misdemeanours, against Sir Elijah Impey, formerly chief justice of the supreme court of Bengal. The substance of these charges, six in number, and which were presented to the House of Commons by Sir Gilbert Elliot, was, that the chief justice had in a variety of instances rendered himself the agent and tool of Mr Hastings, particularly in the decision of a considerable number of important causes. Sir Gilbert stated that Sir Elijah Impey had been declared criminal by parliament, before the parties into which it was at present divided had any existence; and that the proceedings out of which this accusation arose had been carried on by persons of all connections, and countenanced by the different administrations which had succeeded each other during the last six years. He contended that the only means left of reforming Indian abuses, was the punishment, in some great and signal instances, of Indian delinquency; and this proposition he endeavoured to establish by comparing the different force and efficacy of laws, arising from their penal sanctions, when applied in our own internal administration, and in the government of distant possessions. Of the particular charges brought against Sir Elijah Impey, that respecting the fate of Nundcomar, a Hindu prince of the sacred caste of the Brahmins, was the most remarkable. This man having had the weakness or imprudence to lodge an information, or rather accusation, with the East India Company, against their principal servant, Mr Hastings, the governor-general, it was alleged, had procured an accusation to be brought against him, in the court where Sir Elijah Impey presided; and Nundcomar having been tried for forgery on an English statute, was condemned and executed. In the course of the session, witnesses were examined against Sir Elijah Impey; and his defence was undertaken by the chancellor of the exchequer, and the solicitor and attorney-general. On the 9th of May the first charge was rejected by a small majority; and on the 27th the house voted a delay of procedure during three months. This saved the accused, and no impeachment resulted from the inquiry.

During the interval which followed the prorogation of parliament, the only occurrence worthy of notice arose out of the contests of the northern nations. At this period the relative condition of the European powers had undergone a very important change. During a century and a half the power of the monarchy of France had been formidable to all Europe; and, at different periods, the most extensive combinations had been found necessary to resist its ambition. But since the termination of the American war, that monarchy had evidently lost much of its importance among the neighbouring nations. Its influence over Holland had ever been one of its favourite objects of pursuit; but during the preceding year it had suffered that influence to be overturned without a struggle; and, as far as regarded any external effort, France appeared at this time to have fallen into a state of complete imbecility. The powers whose ambition had now become dangerous to the repose of Europe, were Austria and Russia. The latter, in particular, proved extremely restless and enterprising. The empress Catherine II. had contrived to engage in her views the emperor Joseph II. and had prevailed with him to engage in a sanguinary contest on the eastern frontiers of Europe, with a view to the partition of the provinces of Turkey; whilst France, the ancient ally of that power, was unable to afford it any countenance or aid.

In the mean time Catherine held in a state of dependence approaching to subjection the kingdoms of Sweden and Denmark. After the reign of Charles XII. whose

Reign of George III. extravagant military enterprises had exhausted the resources of the country, Sweden sunk into a state of political weakness. The nobles had resumed the independence of the feudal times; the anarchy to which that form of government is so remarkably subject had returned; the crown and the people were equally insignificant; and the mutual animosities of the nobles exposed the state to the intrigues of neighbouring nations. In their diet there was a French party and a Russian party, but there was not an individual among them who supported the party of Sweden. Gustavus III., however, was now in the vigour of his age, and a man of an enthusiastic and enterprising character. By attaching to himself the peasantry of the country and their deputies in the diet, he had, in 1772, re-established absolute power; but the nobles having gradually recovered a portion of their authority, and having been aided by the intrigues of Russia, had now become dangerous to the throne. This rendered the situation of the Swedish monarch extremely uncomfortable, and, exciting in his mind a desire of shaking off all dependence upon Russia, he resolved to take advantage of the war, in which she was actually engaged with the Turks, in order to make an attack on her north-western frontier. To accomplish this object, however, it was necessary that Sweden should be safe on the side of Denmark. But that power had already contracted engagements with Russia; and Gustavus having, it is said, afforded countenance and encouragement to the malcontents of Norway in 1772, this circumstance has been alleged by the Danes as an excuse for the treaty into which their government secretly entered, and by which it was agreed that, if Russia were attacked, Denmark would assist her with twelve thousand auxiliary troops and six ships of the line. But whatever may have been the conduct of the king of Sweden in 1772, he now endeavoured in the most anxious manner to conciliate the good will of Denmark, and at the close of the year 1787 paid an unexpected visit to the Danish court at Copenhagen, where he endeavoured by every argument to prevail with the prince regent and his council to enter into his views regarding Russia. But the court of Denmark could not be induced to countenance his schemes, and appears to have concealed its secret engagements with Russia, as well as the part which it meant to take in the event of a war between Russia and Sweden.

In the month of July the king of Sweden commenced offensive operations on the side of Finland. But the contents which had been fostered by Russia among the Swedish nobles soon broke out; several officers declared that the king had no right to make war without the consent of the states of the kingdom; and the troops refused to advance. Whilst the king was in this embarrassed situation, a Danish army suddenly advanced against Sweden under Prince Charles of Hesse-Cassel, accompanied by the prince of Denmark as a volunteer; and to give this force the appearance of an auxiliary army, the prince of Hesse had been created a field-marshal in the Russian service. The affairs of Sweden were now all but desperate. During the king's absence the senate of Stockholm had assumed extraordinary powers, and summoned a meeting of the states of the kingdom; but Gustavus unexpectedly arrived at Stockholm from Finland, put an end to their proceedings, instantly sent off the whole regular troops from the capital, and having assembled the citizens, declared that he intrusted to their fidelity the defence of his capital, and the protection of the queen and the royal family. His audience were seized with a military enthusiasm; the citizens armed and embodied themselves, and performed the whole duty of the garrison; while such of the officers as had returned from the army in Finland were insulted as traitors, and compelled to conceal themselves. The

king next hastened to the province of Dalecarlia, inhabited by a fierce and ignorant but honest people, celebrated for the share which they had in the revolution by which Gustavus Vasa rescued his country from the despotism and cruelty of Denmark, which had massacred the citizens of Stockholm, and almost exterminated the nobility of the kingdom; and the loyalty of these people being kindled to enthusiasm by this visit of the king to their mines and forests, four thousand of them instantly came forth as volunteers. In the mean time the Danish army, proceeding along the sea coast, which had been left undefended, took a body of Swedes prisoners, and advanced towards Gottenburg, which being mostly built of timber, was liable to instant destruction by bombardment. The place had actually been summoned, when the king, by unusual personal exertion, passed at the critical period unnoticed through the enemy's parties, and entered the city. His presence had the effect of restoring the confidence of the inhabitants, who resolved to encounter every hazard in defence of the city; but the place was thus saved only for a moment, and its situation, as well as that of the king himself, was still extremely perilous. On this occasion, however, the city, the king, and perhaps the monarchy of Sweden, owed their safety to the interference of a British subject, Mr Hugh Elliot, the British envoy at Copenhagen. From the first notice of hostilities, this gentleman, discerning the interests of his country and of Europe, passed over into Sweden, and offered his mediation to the king, at the same time that he threatened the Danes with an immediate invasion by a Prussian army, supported by a British and Dutch fleet. The Danish commander became intimidated, and delayed his threatened hostilities; a Prussian envoy soon arrived, and confirmed all the menaces of Mr Elliot; and the consequence was, that after much negotiation, a suspension of hostilities was concluded, and in the month of November the Danish troops evacuated the territory of Sweden.

At the close of autumn this year a domestic event of a singular nature, and new in the British history, occurred. The health of the sovereign had suffered, not from freedom of indulgence and excess of luxury, but from too severe a regimen, too laborious exercise, too rigid abstemiousness, and too short intervals of rest. As a remedy for the symptoms which manifested themselves, he was advised to resort to the medicinal waters of Cheltenham, and accordingly repaired thither immediately after the prorogation of parliament, and did not return to the metropolis till the 18th of August. But no material benefit had resulted from this excursion. His health continued in a precarious state; and on the 22d of October symptoms were observed by one of the royal physicians, of that alienation of mind which was afterwards the occasion of so many important and interesting transactions. For some time it was thought proper to observe the utmost secrecy respecting the nature of the king's indisposition; and the retreat of the sovereign at Windsor was favourable for this purpose. For several days an opinion was entertained that his indisposition arose from fever, and that it had attained so alarming a height as to threaten speedy dissolution; but the real nature of the malady could not long be suppressed. By the law and practice of the English constitution, almost every species of public business is, in some manner, connected with the exercise of the royal prerogative. The administration of the general government, in particular, was by this event virtually suspended; and notwithstanding the critical situation of Europe, and the very active share which we had taken in its concerns, it was now deemed impracticable to return any sort of answer to the dispatches of foreign courts, or even to those of our own ambassadors. In this situation the most natu-

Reign of George III. Reign of George III.
 ral expedient was to suffer the two houses of parliament, which stood prorogued to the 20th of November, to assemble at that time, and either to adjourn for a short interval, or proceed immediately to discuss the measures which it would be proper to adopt at such a juncture. Circular letters were accordingly addressed to the members of the legislature on the 14th, signifying that the indisposition of the sovereign rendered it doubtful whether there would be a possibility of receiving his commands for the further prorogation of parliament; that in such a case the two houses must of necessity assemble; and that a numerous attendance of the members was extremely desirable.

When parliament assembled, the lord chancellor observed in the House of Lords, that the reason of their being thus unusually called together without the ordinary notice, for the dispatch of business, arose from the severity of the king's indisposition, which had rendered it impossible for him to approach the royal person in order to receive his commands. Lord Camden remarked, that the customary practice of giving forty days' notice previous to the meeting of parliament, was not in his opinion absolutely necessary; that there was an express act of parliament, which limited the notice, in case of treason or rebellion, to fourteen days; that he would therefore recommend an adjournment for that term; and that the chancellor should, by order of the house, address an official letter to every individual peer. In the House of Commons Mr Pitt stated that every authority had been consulted respecting the present singular situation of affairs; that none pointed out either the possibility of directing a new prorogation, or of enabling ministers to open the session of parliament in any regular way; that, under these circumstances, it would be improper for the house to proceed to the discussion of any public business; and that it was absolutely necessary to adjourn. He therefore recommended the interval of a fortnight, when, if the king's illness should unhappily continue, it would be indispensably incumbent upon them to enter upon the immediate consideration of the state of public affairs; and he further moved a call of the house for the 4th of December, and that the speaker should be directed to send circular letters, requiring the attendance of every member on that day.

The tenor of the precedents afforded by the history of England was regarded upon the whole as in favour of a regency, under which the whole, or a considerable part of the power of the state, should be confided to the next heir to the crown, or to the adult of the royal family most nearly related to the king; and what rendered this consideration the more material upon the present occasion was, that the Prince of Wales was understood to entertain an avowed partiality for the political connection which had lately been instrumental in obtaining for him the discharge of his debts and an increase of his annual income, as well as some personal resentment against the ministers now in possession of office. Accordingly, soon after the indisposition of the king had been ascertained, the prince dispatched an express to Mr Fox, who was at that time in Italy, requesting his immediate presence to assist him in forming an administration. The ministers were also aware of the intentions of the Prince of Wales, and wished, if possible, to retain possession of office. Besides, as the duration of the king's illness was necessarily uncertain, and he might speedily be able to resume the reins of government, it was obviously their interest to procrastinate as long as possible; and they were enabled to do so in consequence of the tranquil state of the nation, which rendered the exercise of the executive power of less immediate necessity than in times of war or public alarm. The effect of mere reputation in supporting any political measure was remarkably illustrated on this occasion. Mr Pitt and

his colleagues in office were in possession of the public favour in a degree in which perhaps no ministers had ever before enjoyed it for so long a period of time. To Mr Fox and his associates still attached part of the odium which the coalition and the Indian bill had originally excited. The Prince of Wales himself was even less popular. The sobriety of his father's life formed a contrast to his youthful indiscretions; and the rumour of his marriage with Mrs Fitzherbert was still propagated, and met with credit. In this state of affairs the king's ministers, who had ceased to be any thing more than ministers by courtesy, had every advantage in their project of delaying as long as possible the relinquishment of their official situations, by placing the exercise of the royal authority in new hands. Mr Pitt likewise conducted himself with great dexterity in contriving subjects of discussion in the House of Commons; whilst his antagonists, in contending against him for victory upon speculative political questions, seem not to have been aware that they were in fact fighting his battle, by delaying the period of their own entrance into power.

Upon the re-assembling of parliament on the 4th of December, a report of the privy council, containing an examination of the royal physicians, was presented to the two houses by Lord Camden and Mr Pitt; and it was suggested, that when the delicacy of the subject and the dignity of the person in question were considered, parliament would probably perceive the propriety of acting upon this report, rather than of demanding that more direct and ample information to which, in strictness, they were entitled. This suggestion seemed reasonable, as it could scarcely be supposed that the ministers of the crown would act so directly in opposition to their own interests, as falsely to represent their master as incapacitated by mental disease for the exercise of his royal functions. Mr Fox, Mr Burke, and others, however, would not take any assurance upon this point, but insisted on the solemnity of an inquiry by a committee of the two houses. This was accordingly agreed to, and the report of the committee was laid upon the table of the House of Commons on the 10th, when a further proposition was moved by Mr Pitt for the appointment of a committee to examine precedents respecting those cases in which the personal exercise of the royal authority had been prevented or interrupted by infancy, sickness, infirmity, or any other cause. Mr Fox observed, that though he had no objection to the appointment of a committee for the purpose proposed, yet as it was notorious that no precedent existed which could be applied to the present case, he took the opportunity of stating as a general principle, that the king being at present incapable of holding the executive government, the Prince of Wales had as clear and express a right to assume the reins and exercise the power of sovereignty during the continuance of the present incapacity, as if his father were actually dead; but he added, that though the prince's right was perfect and entire, the two houses of parliament, as the organs of the nation, were alone qualified to pronounce when he ought to take possession of his right. In reply to this observation, Mr Pitt stated, that for any man to assert such a right in the Prince of Wales, otherwise than as it was voluntarily conferred upon him by the two houses of parliament, was little less than treason against the constitution; and that, except by their election, he had no more right, in point of principle, to assume the government, than any other subject in England. On the following day the opinion which had been stated by Mr Fox was attacked in the House of Lords by Lord Camden, and defended by Lord Loughborough and Lord Stormont. Ministers had now got an abstract question as a subject of debate, and they resolved not to lose sight of it, especially as their side of the question was likely to be

Reign of George III. most popular, from being founded on an assertion of the powers of parliament in opposition to hereditary right. Accordingly, when the subject was next mentioned, Mr Pitt said, that the question which had been started respecting the rights of parliament was of much greater magnitude and importance than those which related to the present exigency; and that it was impossible to dismiss the question of right without its being fully discussed and decided. And on the 16th of December, in a committee upon the state of the nation, he entered at large into the subject, and endeavoured to prove by ancient precedents that the powers vested in a regent had always been inferior to those of the king, and that parliament had interfered in cases of royal infancy in appointing councils of regency, nay even a single regent or protector; but he at the same time admitted that it would be expedient to intrust the government to the Prince of Wales, whatever limitations it might be thought necessary to impose on him. Mr Fox, on the contrary, contended that his doctrine was supported by the very nature of a hereditary monarchy. Upon Mr Pitt's principles, said he, if a man were questioned whether the monarchy is hereditary or not, the answer must be, I cannot tell; ask his majesty's physicians. When the king of England is in health the monarchy is hereditary, but when he is ill and incapable of exercising the sovereign authority, it is then elective. He ridiculed the absurdity of Mr Pitt's assertion, that the Prince of Wales had no more right than any subject of the realm, while he at the same time confessed that parliament was not at liberty to think of any other regent. But Mr Pitt's motion on the question of right was carried by a considerable majority.

On the 22d of December Mr Pitt proposed in the House of Commons, a resolution, the object of which was to declare it necessary, for the purpose of supplying the present deficiency, and maintaining entire the constitutional authority of the king, that the two houses should determine on the means by which the royal assent might be given to the bill which they might adopt for constituting a regency. The object of this proposition was obvious. Administration had resolved not to confide the regency to the Prince of Wales except under certain restrictions; but without the royal assent, an act of parliament, fixing these restrictions, could not be passed. They wished, therefore, to devise a solemnity which, in this case, might be held as equivalent to the royal assent; and Mr Pitt proposed, that the great seal should be affixed by the lord chancellor to the act of parliament, and that this should be held as equivalent to the royal assent. Mr Fox, on the contrary, urged an immediate address to the Prince of Wales, requesting him to take upon himself the regency; and upon the point long debates occurred in both houses of parliament, in which administration continued to be supported by the majority.

In the meanwhile Mr Pitt, in the name of the rest of the cabinet, explained to the Prince of Wales, in a letter, the restrictions which were meant to be inserted in the regency bill. These were, that the care of the king's person, and the disposal of his household, should be committed to the queen; and that the power to be exercised by the prince should not extend to the personal property of his father, nor to the granting of any office, reversion, or pension, except where the law absolutely required it, as in the case of the judges, for any other term than during the king's pleasure, nor to the conferring of any peerage, unless upon such persons of the royal issue as should have attained the age of twenty-one years. It was added, that these ideas were founded upon the supposition that the royal malady would only be temporary, and might be of short duration; that it was difficult to fix at present the precise period for which these provisions ought to endure; but that it would

hereafter be open to the wisdom of parliament to reconsider them whenever circumstances might appear to render it eligible. In his answer, which was dated on the second of January 1789, the prince declared, that it was with deep regret he perceived, in the propositions of administration, a project for introducing weakness, disorder, and insecurity, into every branch of public business; for dividing the royal family from each other; for separating the court from the state, and depriving government of its natural and accustomed support; for disconnecting the authority to command service from the power of animating it by reward; and for allotting to him all the invidious duties of the kingly station, without the means of softening them to the public by any one act of grace, favour, or benignity. He stated it as a principle of the British constitution, that the powers and prerogatives of the crown were held in trust for the benefit of the people, and were sacred as conducing to preserve that balance of the constitution which formed the best security for the liberty of the subject; and he objected to making trial in his person, of an experiment to ascertain with how small a portion of kingly power the executive government of the country could be conducted. He stated his conviction, that no event could be more repugnant to the feelings of his royal father on his recovery, than to know that the government of his son and representative had exhibited the sovereign power in a state of degradation and diminished energy, injurious in its practice to the prosperity of the people, and mischievous in its precedent to the security of the monarch and the rights of his family; but he nevertheless declared himself resolved to undertake, under every disadvantage, the office of regent, in order to avoid the evils which might arise from his following a different line of conduct.

The most singular part of this project for the government of the kingdom appears to have been that for confiding to the queen the power of removing, nominating, and appointing the officers of the royal household; assisted by a permanent council, to be selected by parliament, and to consist, in some measure, of the members of administration. The annual income of the royal household was computed at £300,000, and the number of officers of which it consisted amounted to four hundred; an influence which would certainly have been sufficiently formidable to a government in other respects restricted and limited. The lords of the bed-chamber had been made use of to defeat Mr Fox's India bill, and might, under a separate establishment, have proved embarrassing to the existing government. It is obvious, however, that, on this occasion, administration were encouraged in the pursuit of the plan which they had formed for restricting the prince's power, by the addresses presented to them from various parts of the kingdom, expressive of gratitude for the assertion by the House of Commons of their right of providing for the present deficiency.

On the 16th of January Mr Pitt proposed his regency bill, resting it, in some measure, upon the decisive opinion of Dr Willis, who expressed great hopes of the king's recovery; and after long debates, the limitations were sanctioned by a considerable majority. In the House of Lords similar debates occurred, but there also administration proved victorious. On the 31st of January Lord Camden moved in the House of Lords, that the lord chancellor should be directed, by authority of the two houses of parliament, to issue a commission in the name of the sovereign, for the purpose of immediately opening the session of parliament; and this resolution having been carried in both houses, the session was opened in the proposed form on the 3d of February. Though the principles of the regency bill had been previously discussed, yet its various clauses gave rise to new divisions; in which administration still maintained

Reign of George III.

Reign of
George III.

their superiority. The bill passed the House of Commons on the 12th of February, and was presented on the following day to the House of Lords, where it was discussed on the 17th and 18th, and a few unimportant amendments introduced into it.

But here the whole of these proceedings terminated. On the 12th of February, the king having been declared by his physicians to be in a state of progressive amendment, an adjournment of the House of Lords was therefore proposed on the 19th. On the 25th his majesty was declared by his physicians free from complaint; and on the 10th of March the lord chancellor, by the king's authority, addressed both houses of parliament in a speech, after which the ordinary business of the session commenced.

In the meanwhile the administration of Mr Pitt had been less fortunate in Ireland than in this country. The unexampled popularity which reconciled the people of Great Britain to all his measures, and the odium and suspicion which had fallen upon his opponents, had not hitherto been communicated to the neighbouring island. The prospect, therefore, of his departure from office excited little regret in that country, and its parliament made haste to worship what they accounted the rising sun. It had stood adjourned, previous to the royal incapacity, till the 20th January 1789; and the Marquis of Buckingham, then lord-licutenant, with consent of the privy council of Ireland, ventured to defer its meeting till the 5th of February. On the 11th of that month, two motions were offered to the consideration of the House of Commons, the one by Mr Grattan, the member most distinguished for his talents; and the other by Mr Conolly, the richest of the Irish commoners. By the first the royal incapacity was declared; and by the second it was proposed to present an address to the Prince of Wales, requesting him to take upon himself the government, with its various powers, jurisdictions, and prerogatives. After a long debate, the propositions of Mr Grattan and Mr Conolly were carried by a large majority; and on the following day an address to the Prince of Wales was also voted, and sent to the House of Lords, where it was adopted by a great majority. On the 19th of February the address was carried to the lord-licutenant, who, however, refused to transmit it to England; upon which the two houses appointed six commissioners to present the address immediately to the prince: but these measures had scarcely been carried through parliament when the king's recovery rendered them ineffectual, and the consequence was, that the majority of the Irish parliament, who were far from intending to engage in a contest with the British government, found themselves in an awkward situation.

The subject of the slave-trade, which had been brought under the consideration of parliament during the preceding session, was resumed upon the 12th of May. In the interval, petitions against the abolition of the traffic had been presented by persons in London, Liverpool, Bristol, and other places interested in the trade. Meanwhile, the report of the committee of the privy council, of which Mr Pitt had previously given notice, was presented to the House of Commons; and the enemies of the trade had been extremely active in endeavouring to excite the indignation of the public against this odious and inhuman traffic. Innumerable pamphlets were distributed, either gratuitously or at a low price, giving an account of the calamities endured by the unhappy natives of Africa; the wars in which petty princes were tempted to engage, with a view to sell their prisoners to European traders, were fully explained; the wretched manner in which these slaves were transported to the West India colonies, fettered and crowded together so as to occasion the destruction of multitudes by disease, was represented by prints, distributed along

with the popular publications upon the subject; and, lastly, instances were given of the cruelty of the masters in the West Indies, tending to render the white inhabitants extremely odious. By these means the public were led to interest themselves in procuring, if not an abolition of the state of slavery, at least a complete prohibition of the importation of additional slaves from Africa; and to this last object the attention of the legislature was now confined. The business was opened by Mr Wilberforce, who stated the effects of the trade upon Africa; noticed the mode of transportation, which he very fully described; adverted to the diseases contracted on ship-board, with the astringents and washes employed to hide the wounds of the miserable sufferers; descanted on the wickedness of the trade, which he felt to be so enormous and irremediable, that he could stop at nothing short of abolition; asserted that the number of negroes in the West Indies might be kept up without the introduction of recruits from Africa; and moved twelve propositions, stating the number of slaves annually carried from Africa, imported into the British West Indies, and entered in the custom-house accounts; the consequences produced upon the inhabitants of Africa; the injury sustained by the British seamen; the fatal circumstances which attended the transportation of the slaves; the causes of the mortality of the negroes, and a calculation of the relative increase of population in Jamaica and Barbadoes; together with a declaration that no considerable or permanent inconvenience would result from discontinuing further importation. Mr Pitt supported that side of the question which had received the sanction of popular approbation; declaring himself satisfied that no argument, compatible with any idea of justice, could be assigned for the continuation of the slave-trade; and expressing a hope, that while Great Britain took the lead of other countries in a matter of so great magnitude, foreign nations would be inclined to share the honour, and contented to unite with us in so excellent a work. Mr Fox highly approved of what had fallen from Mr Pitt, and declared that he had considered the trade in human flesh as so scandalous, that it was in the last degree infamous to suffer it to be openly carried on by the authority of the government of any country. Mr Burke was of opinion that, whatever might be the present situation of Africa, it could never be meliorated under the present system; that while we continued to purchase the natives, they must forever remain in a state of savage barbarity; that it was impossible to civilize a slave; and that there was no country situated like Africa into which the shadow of improvement had ever been introduced. On the other hand, Mr Wilberforce's propositions met with considerable opposition. Mr Savage and Mr Newnham, on the part of the city of London, asserted, that the measure, if carried into effect, would render the metropolis bankrupt; Mr Dempster thought that Mr Wilberforce's first proposal ought to be, to make good out of the public purse the losses which individuals would sustain from the abolition of the trade; Lord Penrhyn asserted, that as there were mortgages in the West India islands to the amount of seventy millions sterling, Mr Wilberforce's project would subject the country in the repayment of that sum; Mr Henniker opposed the abolition, on account of the alleged depravity of the Africans, which rendered them incapable of civilization; and Lord Maitland, Mr Marsham, Mr Hussey, Mr Rolle, Mr Drake, and Mr Alderman Watson, each alleged something intended to pass as a reason for entertaining similar views. Lastly, the matter ended in the renewal of Sir William Dolben's act to regulate, for a limited time, the mode of conveying slaves in British vessels from the coast of Africa.

The annual business of the budget was not brought for-

Reign of
George III.

ward this year till the 10th of June; and immediately previous to the discussion, the office of speaker of the House of Commons was vacated by the promotion of Mr Grenville to be one of his majesty's principal secretaries of state. On this occasion Mr Henry Addington, the personal friend of the premier, and son of Dr Stephen Addington, physician to Mr Pitt's family, was appointed to succeed Mr Grenville in the chair. His opponent was Sir Gilbert Elliot, who was proposed by the opposition; and both Mr Fox and Mr Burke animadverted on the youth and inexperience of his competitor; but on a division Mr Addington was elected by a large majority.

The expense incurred by the recent armament, the allowance to the American loyalists, and other circumstances, rendered it necessary to have recourse to a loan of one million, to defray the interest of which additional taxes were imposed upon newspapers, advertisements, cards, and dice, probates of wills, legacies to collateral relations, and carriages and horses. And as one of Mr Pitt's methods of extending the revenue consisted in endeavouring to suppress smuggling, and as he had formerly transferred the management of the duty on wine from the customs to the excise, he now pursued the same course in regard to the article tobacco. The subject was opened in the House of Commons on the 16th of June, when it was observed that tobacco had come to be considered as the staple of the smuggler, in the same manner as tea, wine, and spirits, had formerly been. The quantity of tobacco consumed in the kingdom had been found to bear a tolerably near proportion to the quantity of tea; and at least one half of this quantity was the exclusive commodity of the smuggler. The consumption amounted to fourteen millions of pounds; and the loss to the revenue upon the half of this consumption exceeded three hundred thousand pounds per annum. Under these circumstances, Mr Pitt thought it necessary to have recourse to the system of excise, by which the stock of the dealer was taxed, instead of the duty being collected on importation. A bill was accordingly introduced for effecting the transference proposed by the minister, and, after a good deal of discussion, passed by a large majority.

Mr Fox having annually brought forward a motion for the repeal of the shop-tax, which had proved extremely unpopular in the capital, Mr Pitt at length consented that it should be abolished. Mr Beaufoy again introduced a motion for the repeal of the corporation and test acts, which was supported by Mr Fox, opposed by Lord North and Mr Pitt, and rejected by a narrow majority. A bill introduced into the House of Lords by Earl Stanhope, for relieving members of the church of England from various penalties and disabilities under which they laboured, and for extending freedom in matters of religion to persons of all denominations, Catholics excepted, was equally unsuccessful. The laws it intended to repeal were those which imposed penalties upon persons who did not frequent the established worship; prohibiting men from speaking or writing in derogation of the doctrine of the book of common prayer; enjoining the eating of fish on certain days; authorizing the imprisonment of persons excommunicated; prohibiting the exportation of women; and declaring all persons who went to court, without having previously made a certain declaration, to be in the eye of the law Popish recusant convicts. But these absurd and obsolete enactments were stoutly defended by the episcopal bench; and he bill was ultimately rejected.

On the first of July the East India Company petitioned the House of Commons for permission to add a sum of one million to their capital; and the request was granted with little difficulty. On the same day Mr Dundas, as president of the board of control, brought forward a state-

ment of the revenues of India, which, after deducting every article of expenditure in that country, he calculated at L.1,820,000. During the present session, the trial of Mr Hastings still proceeded before the House of Lords. The third charge brought forward, respecting presents received by him during his government of Bengal, was opened by Mr Burke, who, in the course of his speech, alluded to the trial and execution of Nundcomar, and asserted that Mr Hastings had murdered that man by the hands of Sir Elijah Impey. But as the transaction respecting Nundcomar formed no specific part of the charges which had been preferred against Mr Hastings by the House of Commons, and as the question, in as far as Sir Elijah was implicated, had been examined and rejected during the preceding session, Mr Hastings presented a petition to the house, in which he entreated them, either to cause the additional allegations urged against him to be brought forward, and prosecuted in specific articles, or to afford him such other redress as they might judge suitable and proper. Mr Pitt supported the petition, upon the ground that the murder of Nundcomar formed no part of the crime of peculation, and every rule of evidence was against its being alleged; that it had been charged in order to discredit the character of the accused, although it was a rule in the courts of law that no fact could be given in evidence to discredit even a witness; that if the murder of Nundcomar was not admissible as evidence, it could only be urged as matter of aggravation, which it was impossible to allow; and that the common sense of the house, and of all mankind, would not permit the crime of murder to be urged as an aggravation of the crime of peculation. Mr Fox, on the contrary, cited the case of a captain of a ship, against whom murder was charged in having thrown his cargo of slaves overboard, in order to prove that he had by sinister means endeavoured to defraud the underwriters of the amount of the insurance; and maintained that the present case exactly corresponded to this. It was impossible to describe the corrupt transactions of Mr Hastings without alluding to the crimes which had accompanied them, or to relate the crimes without mentioning the names of the persons by whom they had been committed. A resolution, however, was moved and carried, by which it was declared, that no authority had been given by the House of Commons for making any allegation against Mr Hastings respecting the death of Nundcomar, and that the words of Mr Burke, complained of in the petition, ought not to have been spoken.

The session of parliament was terminated on the 11th of August, by a speech from the lord chancellor in the name of the king. The summer passed away without producing any memorable event, and parliament assembled again on the 1st of January 1790, when they were met by the king in person, who, in the speech from the throne, observed that he continued to receive assurances of a pacific nature from the different powers in Europe, and at the same time congratulated the nation on the happiness it enjoyed, from the increasing advantages of peace.

Chauvelin.—The King's message announcing War.—Attempt by the French to re-open negotiations.—Declaration of War.

During the preceding summer the eventful career of the French revolution had commenced. The extreme weakness into which the government of France had fallen, owing to the pressure of the public debts, and the embarrassment of the finances, had induced the king to call together the states general of the kingdom, which soon assumed the title of the national assembly. Their debates, which were held in public, diffused a love of innovation, and a desire to reform their ancient government, and establish a free constitution. The court became alarmed by the violence of their proceedings, and attempted to set bounds to their projects; but the populace of the capital rose in arms, and the military refused to act against them. Meanwhile the national assembly proceeded daily in the discussion of new plans of change. They seized the ecclesiastical property and tithes, resolving to limit the clergy for the future to fixed salaries; they put an end to the monastic institutions; they abolished the whole order of nobility, and limited the power of the crown. These, and other proceedings, which will be stated in their proper place, excited much attention in Britain; and accordingly allusions to them became not unfrequent in parliament during the present session; indeed general questions were debated with more animation, and excited a higher degree of interest, than they had for many years done.

The supplies for the navy and army, which were stated at the same amount as in the preceding session, produced some animadversions from Mr Marsham and Mr Pulteney, who alleged that, in the actual state of Europe, the military establishment of Britain might safely be reduced. Mr Fox observed, that if ever there was a moment in which he could be less jealous than at another of an increase of the standing army, the present was that moment. The example of a neighbouring nation had proved that the former imputations upon standing armies were entirely unfounded and calumnious; and it was now universally known throughout all Europe, that a man by becoming a soldier did not cease to be a citizen. He thought the new form which the government of France was about to assume, would render her a better neighbour than when her affairs were controlled by the intrigues of ambitious and interested statesmen. Mr Pitt acknowledged that the tumultuous situation of France afforded a prospect of tranquillity; but he thought that the opportunity ought to be seized to raise our army to such a state of respectability as would leave no hopes of future hostility. The present convulsions of France must sooner or later terminate in the re-establishment of order; but there was a probability, that while the fortunate arrangements of such a situation

might render her more formidable, they would also convert her into a less restless neighbour. As an Englishman and as a man, he wished for the restoration of tranquillity in France, though that event appeared to him considerably distant. Whenever it arrived, and her inhabitants became truly free, they must be in possession of a freedom resulting from order and good government, and they would then stand forward as one of the most brilliant powers in Europe; nor could he regard with envious eyes an approximation towards those sentiments which were characteristic of every true British subject. But while Mr Pitt, who had commenced his public career as the champion of political reform, and still on important occasions represented himself as preserving his attachment to popular rights, was thus applauding the first revolutionary movements of the French, his friends considered themselves as at perfect liberty to give utterance to sentiments of a very different nature upon the subject. Viscount Valletort, who moved the address, expressed great compassion for the king of France, then almost a prisoner in his own palace, and for the families of distinction who had found it necessary to fly to foreign countries to avoid the unexampled barbarities which were committed with impunity at home; and Colonel Phipps declared that the praise bestowed by Mr Fox upon the conduct of the French military, was a poor compliment to the profession in general, and that, if he had wanted a subject for panegyric, he ought rather to have adverted to the conduct of the English army during the riots of 1780, when they were not led by false feelings to put themselves at the head of schemes leading to anarchy and cruelty.

On the 9th of February, when the vote of supply for the army came a second time under consideration, Mr Burke revived the subject of the French revolution. He declared himself, in decided terms, an enemy to the measures which had lately taken place in that country; and conceived that it would be the greatest of all calamities for Britain, if any set of men amongst us should represent the late transactions in France as fit objects of imitation. He, however, condemned the greatness of our military establishment, by reason of the weakness of France; and declared, that on looking over the geography of this part of the world, he saw a great gap, a vast blank, the space hitherto occupied by France, which had no longer any political existence. France had at different periods been as dangerous to us by her example as by her hostility. In the last age, we had been in danger of being entangled, by her example, in the net of a relentless despotism. Our present danger, from the example of a people whose character knew no medium, was that of being led, through an admiration of successful fraud and violence, to imitate the excesses of an irrational, unprincipled, proscribing, confiscating, plundering, ferocious, bloody, and tyrannical democracy. They had a good political constitution the day their states general assembled in separate orders; but this they had destroyed. They had now no other system than a determination to destroy all order, subvert all arrangement, and reduce every description of men to one level. It was absurd to compare a proceeding like this to the revolution in England, which neither impaired the monarchy nor the church, and merely drove away a legal monarch, who was attempting arbitrary power.

Mr Fox expressed great concern at differing in opinion from Mr Burke, for whom he avowed the highest reverence and esteem. He repeated his former opinion upon the subject of French affairs, but declared himself an enemy of all absolute forms of government, whether monarchical, aristocratical, or democratical. Mr Sheridan in more unqualified terms stated his disapprobation of Mr Burke's sentiments, expressed his surprise that any man

who valued the British government should feel such abhorrence of the patriotic proceedings in France, and declared himself as ready as Mr Burke to detest the cruelties which had been committed. He complimented individually the Marquis de Lafayette, M. Bailli, and other French patriots, and expressed a hope that the despotism of France would never be restored; but observed that he ought not on that account to be considered as approving of a wanton persecution of the nobility, or an insult to royalty. Mr Burke answered Mr Sheridan with indignation, and denied that he was the advocate of despotism; but declared that Mr Sheridan had sacrificed his friendship for the applause of clubs and associations.

It is probable that Mr Pitt had now become aware of the difficulty of his situation with regard to the French revolution, which at this period was generally regarded with approbation in Britain, as an imitation of that spirit by which our ancestors had raised their country to a state of unexampled prosperity and happiness. Mr Pitt must already have known that the court regarded it in a very different light; and that, at no distant period, his ambition and his love of popularity might become incompatible. On the present occasion he undoubtedly saw with satisfaction a division likely to occur among those who had hitherto been his competitors for popularity; and with that dexterity in debate for which he appears to have been remarkable, he instantly endeavoured to widen the breach, and to attach to himself a man of so much intellectual power as Mr Burke, declaring that he agreed with the latter in almost every thing he had urged respecting the late commotions in France; that the sentiments Mr Burke had professed respecting the British constitution filled him with the sincerest satisfaction; and that the manner in which he had pledged himself to maintain it for ever inviolate, entitled him to the gratitude of his fellow-citizens and the admiration of posterity.

A new effort was made on the 2d of March to procure a repeal of the corporation and test acts. The dissenters had prevailed with Mr Fox to introduce the motion; but the clergy of the church of England, alarmed no doubt at the downfall of the ecclesiastical establishment in France, were anxious to diffuse a spirit of opposition to the intended attack. Mr Fox represented his whole argument as resting upon this principle, that no government has a right to animadvert upon the speculative opinions of its subjects, till these opinions produce a conduct subversive of the public tranquillity. It had been remarked that certain errors in religion tended to disturb the public tranquillity; but surely political errors must have this tendency in a much greater degree; yet such was the absurdity of the test laws, that a man who favoured arbitrary power in his sentiments, who considered the abolition of trial by jury as no violation of liberty, and the invasion of the freedom and law of parliament as no infraction of the constitution, might easily pave his way to the first situations in the state. Mr Pitt, as usual, supported the privileges of the established church; asserting, that though opinions might not be a warrantable ground for criminal accusation, yet they might afford a good reason for excluding particular individuals from the public service; and that to discover dangerous opinions a test might be highly expedient. Mr Burke was decidedly hostile to the measure. Mr Fox had stated the principles of toleration and persecution, but abstract principles he always disliked. Of all abstract principles, however, those of natural right, upon which dissenters rested as their stronghold, were the most idle and the most dangerous; they superseded society, and snapped asunder all those bonds which had for ages constituted the happiness of mankind. He adjured the house not to suffer the fatal incidents which had attend-

ed the church of France, plundered and demolished in so disgraceful a manner, to abate their zeal in favour of our present happy and excellent establishment. Mr Fox in reply declared himself filled with grief and shame at the sentiment which Mr Burke had avowed, and asserted that all the principles he had stated had formerly received the sanction of his friend. He thought Mr Burke at present misled by his sensibility; his feelings had been shocked and irritated by a mistaken idea of the transactions in France, which were in reality nothing more than the calamities to which every country was unavoidably subject at the period of a revolution in its government, however beneficial and salutary. The proposed repeal was of course rejected on a division.

A few days afterwards Mr Flood brought forward a motion for the reform of the representation of the people in parliament, and proposed to add a hundred members to the House of Commons, to be elected by the resident householders in every county. Mr Windham opposed the motion, on the ground that the country had prospered under the representation as it stood, and because innovations had become extremely dangerous. Where, said he, is the man who would repair his house in the hurricane season? Mr Fox, on the contrary, declared himself as much persuaded as ever of the necessity of reform; but he thought the majority of the nation of a different opinion, and was therefore of opinion that the motion ought to be withdrawn. Mr Pitt considered the proposal as brought forward at an improper time, and said he wished to wait for a more seasonable opportunity, when he would certainly again submit his ideas upon the subject to the consideration of the house. Mr Flood accordingly withdrew his proposition.

On the 5th of May a message from the king informed both houses of parliament of certain acts of hostility committed by the Spaniards in the seizure of three British vessels which had attempted to establish a foreign trade between China and Nootka Sound, on the west coast of North America. The Spaniards conceiving the whole of that part of the American coast to be their property, were the first to give information of what they had done, and required that steps should be taken by the British government to prevent future encroachments upon that coast. The British navy was instantly augmented; and as a war with Spain, unassisted by France, could not prove very formidable, the public seemed to regard the approach of hostilities with little concern. But the determination evinced induced the Spaniards to come to an accommodation, and the dispute ended without an appeal to arms. During the present session little progress was made in the trial of Mr Hastings; and both parties accused each other as the authors of the delay that had taken place, while the subject began to be neglected or forgotten by the public. On the 10th of June the king put an end to the session by a speech from the throne, and this parliament was dissolved.

At this period the Austrian Netherlands were in a state of great agitation. The people of these provinces had long been governed by a feudal constitution, which vested important privileges in the clergy, the nobles, and certain classes of citizens, but more especially in the clergy. Joseph II. had invaded these privileges, seized upon the greater part of the property belonging to the monasteries, and driven from the country all who opposed his innovations. At length, about the end of the year 1789, the exiles having united on the frontiers, entered the country, and being joined by others, formed a considerable army, which rapidly overran the whole of Austrian Flanders; while the emperor, engaged in a war with the Turks, was prevented from sending any considerable force against

Reign of
George III.

them. In December, the states of Barbant having assembled, appointed an administration, at the head of which was Henry Vander Noot, a popular advocate; and in January 1790 were formed the outlines of a federal constitution, by which each of the Belgic provinces was to retain its peculiar constitution, whilst the general defence of the republic was to be intrusted to a congress. Meanwhile a considerable number of foreigners entered into the service of this new republic. But it soon appeared that the Belgic revolution would produce no lasting effects. The old aristocratical government, uncontrolled by the authority of a prince, was everywhere adopted; the power of the clergy was even increased; the very first step of the Belgian congress was a public declaration of religious intolerance; and the liberty of the press was prohibited, and state licensers appointed. The consequence was, that discontents speedily arose. But at this period the emperor Joseph died, and was succeeded by Leopold, archduke of Tuscany, who issued a proclamation, inviting the revolted provinces to return to their allegiance, and promising to restore their ancient political constitutions. And not trusting to peaceful measures alone, he sent an army against the insurgents, and at the end of the year the house of Austria had recovered its authority in the Netherlands.

The new parliament assembled on the 25th of November 1790. As no uncommon efforts had taken place at the preceding elections, nearly the same members as formerly were returned to the House of Commons; and Mr Addington was chosen speaker. On the following day the session was opened by a speech from the throne, in which his majesty informed parliament that the differences which had arisen with the court of Spain were brought to an amicable termination; that a separate peace had been concluded between Russia and Sweden; that, in conjunction with his allies, he had employed his mediation to negotiate a treaty between Russia and the Porte; that he was endeavouring to assist in putting an end to the dissensions in the Netherlands; but that the peace of India had been interrupted by a war with Tippoo Sultan, son of the late Hyder Ali. The speech concluded with recommending to parliament a particular attention to the state of the province of Canada. Various debates, of little importance in a historical point of view, occurred respecting the negotiations with Spain, the fur trade at Nootka Sound, and the expensive naval armament which had been fitted out to enforce the claims of Britain.

But in the beginning of March 1791 a bill was brought into parliament by Mr Pitt for regulating the government of the province of Canada in North America. This circumstance is chiefly worthy of notice on account of an altercation to which it gave rise between Mr Burke and Mr Fox. During the last session of the former parliament Mr Burke had declared his disapprobation of the French revolution, whilst Mr Sheridan and Mr Fox had expressed very opposite sentiments. Mr Pitt, as we have already seen, had dexterously laid hold of the opportunity to excite disunion among his antagonists, and had declared himself highly satisfied with Mr Burke's attachment to the British constitution. Mr Burke, on the other hand, had long been engaged in a career of fruitless opposition to the existing government; and during the king's illness, in the end of the year 1788, he had indicated such an indecent impatience when any expectation was expressed of his majesty's speedy recovery, as sufficiently demonstrated how eager he was to obtain possession of office. It is not improbable, therefore, that the approbation expressed by Mr Pitt, of his fears on account of the French revolution, suggested a decisive opposition to that great national movement, as a mode of ingratiating himself with administration; and that this idea, concurring with his former

sentiments, stimulated his eager mind to devote his principal attention to the subject. Accordingly, in November 1790, he published a treatise, in which he endeavoured to vilify the French national assembly, and to hold out the revolution as a subject of alarm and of detestation to all Europe. The style of copious and popular eloquence in which the book was written, together with the sentiments which it contained, produced a great impression; and replies to it were published by Dr Priestley and others; but that which proved most successful in gaining the attention of the public, was the production of Thomas Paine, who had formerly published in North America a pamphlet entitled *Common Sense*, which proved extremely prejudicial to the royal cause throughout the colonies. His present work contained a statement of the facts connected with the French revolution, together with satirical strictures upon what he accounted imperfections in the British constitution. He was not equal to his antagonist in copiousness of diction; but in shrewdness of remark and concise effective energy of style he was superior. Mr Burke's love of literary fame was great; and it had been highly gratified by the attention which his book had attracted, particularly among the higher orders. Hence, when he saw his reputation rudely assailed, his temper became ruffled; and he appears to have wished for an opportunity of separating himself from his former political associates. Accordingly, on the 6th of May, when the clauses of the Quebec bill were about to be discussed in a committee of the whole house, he rose, as he said, to speak to the general principle of the bill, and enlarged upon the importance of the act which they were about to perform, namely, that of appointing a legislature for a distant people. But he thought the first consideration ought to be the competency of the house to such an act. By what were called the "rights of man," a body of principles lately imported from France, all men are by nature free, and equal in respect to rights. If such a code were admitted, the power of the British legislature could extend no further than to call together the inhabitants of Canada to choose a constitution for themselves. But, rejecting this code, which was never preached without mischief, he assumed the principle, that Britain had acquired the right of legislating for Canada by conquest. The next question was, what model was to be followed in instituting a government for Canada; whether that of America, of France, or of Great Britain, which were the three great modern examples. In discussing this point, he diverged from the subject more immediately before the house, and took an opportunity to pronounce a vehement invective against the principles and enactments adopted by the French national assembly, in attempting to form a new constitution. He was called to order by some of his former friends, and an altercation ensued, in the course of which he asserted that a design had been formed by certain persons in this country against the constitution. Mr Fox accused Mr Burke of leaving the question before the house to seek a difference with him, and to fortify misrepresentations of something which he had said in a former debate concerning the French revolution; and he adhered to his former sentiments in approving the revolution, though not the new constitution of France. Mr Burke repeated his attack upon the French revolution, and declared that his friendship with Mr Fox was dissolved by that accursed event. Mr Fox, with much apparent agitation, endeavoured to soften the asperity of Mr Burke, but without effect. He had evidently resolved upon the part he was to act; and this may be considered as the first occasion upon which any member of the British legislature represented his own conduct as seriously influenced, to the extent of deserting his former political views and associates, in consequence

Reign of
George III.

Reign of George III. of an alarm originating in the example of the French revolution.

During the session, the question of the slave-trade was again brought forward by Mr Wilberforce, and was supported by Mr Pitt and Mr Fox; but his motion was nevertheless negatived by a considerable majority. The zeal of the nation in favour of abolition had however become very great; and as the evidence led before the House of Commons had represented the trade as the source of innumerable crimes and great misery, a company was established with the view of civilizing the natives of Africa, and of cultivating, by the hands of freemen, West India productions in that country; and having received a charter, they fixed on Sierra Leone as their principal settlement, and great expectations were entertained of the success of the project; expectations destined never to be realized.

On the 28th of March a message from his majesty announced that his endeavours to effect a pacification between Russia and the Turks having proved unsuccessful, he had judged it necessary to add weight to his representations, by making some further augmentation of his naval force. The point in dispute related to Oczakow, a town situated upon the Black Sea, at the mouth of the river Dnieper, which had been taken from the Turks, and was considered by Russia as a situation of great importance with reference to future operations against the Ottoman empire. The Turks, greatly exhausted by the contest, were reduced to the necessity of purchasing tranquillity at almost any price; but Prussia, alarmed at the growing power of Russia, had, in conjunction with Britain and Holland, offered to mediate a peace, with a view to procure the restoration of Oczakow to its former masters. Russia, however, refused the offered mediation, and also declined to renew any commercial treaty with Britain; though she had concluded one with France and another with Spain, and even entered into a quadruple alliance with these countries and with Austria, for the purpose of restraining the influence of Prussia, Britain, and Holland. In moving an address to his majesty on this message, Mr Pitt observed, that having entered into defensive alliances, which were admitted to be wise and politic, we ought to adhere to them; that Prussia was our ally, and any event calculated to affect that power, and diminish its influence on the Continent, would be injurious to us, as far as our mutual interests were concerned; and that the progress of the Russian arms against the Porte gave sufficient cause for alarm, since, if the power of the Porte were further humbled by its aspiring rival, Prussia would instantly feel it, and not Prussia alone, but all Europe. Mr Fox, on the contrary, expressed his conviction that Prussia could not be endangered by the progress of the Russian arms in Turkey, and that an alliance with Russia appeared to him the most natural and advantageous which we could possibly form. The address, however, was carried by a large majority. But the opposition, finding that they were supported by greater numbers than usual, and that a war with Russia was unpopular, brought the question repeatedly forward; and administration, perceiving the current of public opinion to run against them, abandoned their views, and refused to support Prussia in attempting to set bounds to the ambition of Russia.

On considering the state of Europe at the time, administration were probably guided, in their jealousy of Russia, by the maxims which had influenced the politics of Great Britain during the best periods of its history. The Spanish monarchy had long been in a state of debility, which rendered it of little weight or importance on the continent of Europe; and France had likewise suffered her armies to decline, and, by a sort of family compact,

had fallen under the influence of Austria; whilst the revolution, or rather the weakness which preceded it, had incapacitated her for interfering in foreign affairs. In the mean time Austria and Russia, relinquishing all rivalry, had entered into a close combination, and acted in subserviency to their mutual ambition. Hence, to preserve some tolerable balance of power on the continent of Europe against these two great military empires, it became absolutely necessary for Great Britain and Holland to unite with Prussia and Sweden, and to protect the Turks, in order to prevent the further aggrandisement of these two great and warlike powers. The British ministry, however, finding a war with Russia likely to prove unpopular, consented that Great Britain should descend from her proud station of holding the balance of the Continent; and the consequences of this desertion speedily appeared; for Prussia, no longer backed by Britain, was under the necessity of joining Russia and Austria in their schemes of aggrandisement at the expense of the weaker powers, that she might strengthen herself by a share of the spoil, and maintain her position in relation to these powers. How far the British administration acted culpably in deserting what they accounted their duty, in compliance with the apparent wish of the nation, is a question which was never discussed, because the consequences of their conduct were soon overlooked and forgotten amidst the great events which speedily occurred. From the love of popularity, and the habit of resisting all the projects of administration, opposition at this time encouraged the pusillanimity of their countrymen; whilst the members of administration, fearful of losing their places, suffered their country to be degraded from its proper rank and influence in Europe, and prepared the way for the partition of Poland, the projected partition of France, the war of the revolution by which that project was resisted, and the immeasurable aggrandisement of the power which soon proved so dangerous to Britain and to all Europe.

An unsuccessful effort was made during this session of parliament by Sir Gilbert Elliot, to procure for the members of the church of Scotland an exemption from the test act. But the Roman Catholics in England were more fortunate in obtaining relief from certain penal statutes. As the Catholic church was the great object both of political and religious terror in the first stages of the reformation, the English statute book was loaded with the most rigorous edicts against the professors of that obnoxious faith; and though some of these were removed in the year 1780, yet in 1791 not less than seventy pages of Burn's Ecclesiastical Law were occupied with the enumeration of the penal statutes in force against the Roman Catholics. Amongst these were some of the most sanguinary nature. For example, it was high treason and death to make a convert to the Catholic faith; and severe penalties were enacted against papists for hearing mass by some statutes, whilst by others they were compelled to attend the established worship, however contrary to their consciences. A reform was therefore imperiously called for, and had become the more reasonable, as, in the year 1790, a body of Catholic dissenters had formally protested against the temporal power of the pope, and against his assumed authority to release men from their civil obligations, or to dispense with the sacredness of oaths. Mr Milford, therefore, brought forward a bill to relieve the protesting Catholics from the penalties and disabilities to which persons professing the Romish religion were subject by law; and the bill passed unanimously, excepting that Mr Fox wished to extend it, not merely to protesting, but to all Roman Catholics; upon the principle, that the state has no right to inquire into the opinions, either political or religious, of the people, but only to take cognizance of their actions.

Reign of
George III.

The war now carrying on in India gave rise to some debates during the present session. Like all other wars in that quarter of the globe, it had been undertaken on our part for the purpose of aggrandisement, and on the part of our antagonist from a jealousy of the British power. The ostensible cause of the war, however, was, that the Dutch had long been in possession of two forts upon the frontier of Hyder Ali's kingdom of Mysore; that in the year 1780 Hyder had seized and garrisoned these forts, under the pretence that they belonged to a vassal of his; that having speedily thereafter induced the Dutch and French to join him against the British, the forts were given up to the Dutch; that in 1789, Tippoo had again claimed the forts; and that the Dutch, dreading his power, had sold the forts to the rajah of Travancore, a vassal or ally of the British. Tippoo, resenting this mode of evading his claim, made war upon Travancore; but as the rajah had effected the purchase under secret instructions from the British government in India, he was defended by them. Thus the war was said on our part to have been entered into in defence of the just rights of our ally, the rajah of Travancore; whilst on the other hand it was contended that this was nothing more than an attempt to subdue the sovereign of Mysore, and extend our eastern empire, at a time when the power of France was annihilated, and our own forces in great strength in that quarter. In the trial of Mr Hastings little progress was made during the present session. As parliament had been dissolved during the dependence of the trial, a question occurred, whether that circumstance did not put an end to the impeachment. The friends of Mr Hastings adopted the affirmative side of the question, and were supported by Mr Erskine and the attorney and solicitor general, Macdonald and Scott; whilst Mr Pitt, Mr Burke, and Mr Fox contended that a dissolution could have no effect upon an impeachment. After much discussion, it was carried in the House of Commons that the impeachment was still depending, and the same decision was adopted by the House of Lords. The session of parliament was concluded on the 10th of June.

As the avowed object of the first leaders of the revolution in France was the establishment of a system of political freedom, or of a representative government, with a hereditary monarch at its head; and as one of the consequences which they expected to follow from the establishment of the new system was the complete abolition of wars, which they ascribed entirely to the ambition of kings; the progress of the revolution was regarded with much favour by many persons in Great Britain. The reform of the Gallican church, though it alarmed the English clergy, was favourably regarded by the English dissenters; and the abolition of titles of honour was not disliked in a country where they are only enjoyed by a few individuals, and are chiefly valued on account of the privilege of hereditary legislation by which they are accompanied. The English also had long been accustomed to boast of their political freedom, and of their superiority in this respect over their French neighbours; and hence, when the populace of Paris rose in arms, when the military refused to act against them, and when the state prison or fortress of the Bastille was taken and demolished, many persons in Great Britain regarded as an imitation of the efforts of our ancestors the attempts made by the French to shake off the ancient despotism, and to renovate the order of society. The public at large indeed had not yet given much attention to the subject; but of the speculative and enthusiastic there was a sufficient number to form numerous convivial parties in commemoration of the 14th of July, the day on which the Bastille had been taken. These meetings, it is true, were on the whole regarded

rather unfavourably by persons attached to the monarchical part of our constitution; but no public expression of disapprobation had hitherto appeared.

A festive meeting of this nature was to have been held at Birmingham on the 14th of July 1791; but several days preceding it, some unknown person had left in a public-house copies of an inflammatory handbill, representing the late transactions in France as proper to be imitated in England. The contents of this placard were very generally circulated, and produced much conversation in the town; upon which the magistrates offered a reward of a hundred guineas for discovering the author, printer, or publisher. Meanwhile the friends of the intended meeting disclaimed in the strongest terms the sentiments expressed in the seditious handbill; and finding their views misrepresented, they at first resolved that the meeting should not take place; but another determination was afterwards adopted, and the company assembled to the number of eighty. The party, however, had scarcely met when the house was surrounded by a tumultuous rabble, who expressed their disapprobation by hisses and groans, and by shouting "church and king." Upon this the meeting immediately dispersed. But in the evening the mob attacked and burned a Unitarian meeting-house belonging to the congregation of Dr Priestley; and although this distinguished person had not been present at the meeting, his house, from which he was compelled to fly with his family, was also attacked, and his library, his valuable philosophical apparatus, and his manuscripts and papers, were destroyed. During the three succeeding days they destroyed some other meeting-houses, together with the dwelling-houses of several eminent dissenters in the neighbourhood; and it was not till the night of the fourth day that some parties of light dragoons arrived. The damage done was very great; and the magistrates were accused of at first favouring and encouraging the mob, whose excesses they afterwards found it impossible to restrain. Five of the rioters were tried at Worcester, and one was convicted and executed. At Warwick twelve were tried, and four convicted of burning and destroying houses, three of whom were executed, and one was relieved upon the application of the magistrates, as it appeared that his interference in the riot had been accidental.

At this time a foundation was laid on the Continent for the most important political changes. The various nations of Europe had for some centuries owed their independence to the jealousies which they mutually entertained. Many petty states were altogether unable to contend in war against their powerful neighbours; but they owed their safety to the circumstance of their neighbours being held in check by other great powers, who resisted all attempts at aggrandisement. When one nation became dangerous by its ambition, the combination of a number of other states repressed its machinations; and thus the Spanish, and afterwards the French monarchies, were restrained within due bounds. But in the course of the century the power of Russia had become formidable in Europe; and its rulers sought rather to undermine than to overthrow that balance of strength to which the lesser states of Europe had owed their safety. A former Russian sovereign had entered into a close alliance with the head of the house of Austria; and, notwithstanding the talents of the great Frederick, this union had nearly proved fatal to the Prussian monarchy. Finding the advantage of such an alliance, the house of Austria attempted at the same time to attach itself to France, its ancient hereditary enemy, by the marriage of the archduchess Marie Antoinette to the dauphin, afterwards Louis XVI.; and this marriage fully produced all its intended political effects. The French court, relinquishing its former policy of humbling

Reign of George III. Austria, suffered its armies to fall into decay, and allowed itself to be led on all occasions by this more active power; and the revolution, which wrought so radical a change in the government of the nation and the order of society, by subverting every existing establishment, and exciting jealousy and discontent in every quarter, reduced the nation, in the eyes of foreign powers, to a state of utter debility. The king and royal family, exposed to endless insults and humiliations, had been compelled to submit to a new constitution, which placed the royal authority on a very precarious footing; the principal nobility had emigrated, and the king himself had attempted to follow their example; but being seized at Varennes, he was brought back as a fugitive, and placed at the head of a form of government which he had neither the power nor the inclination to administer.

In this state of affairs Russia and Austria, acting in conjunction, saw nothing to resist their ambition. They had recently wished to seize upon and divide the richest provinces of Turkey; but the Austrians having met with unexpected resistance, desisted from the attempt. The Russians however were more successful. The king of Prussia, with the aid of Britain and Holland, had attempted to restrain their progress; but being deserted by Britain, he now found it necessary to keep on fair terms both with Russia and Austria; and for this purpose, as well as to avoid being left behind in the career of usurpation and aggrandisement, he was compelled to enter into all their ambitious schemes. Poland and France were at this time two of the weakest states in Europe. For the sake of erecting a barrier to his own states, the Prussian monarch had encouraged the king and the leading nobles to form a new political constitution for Poland, by which its government might be strengthened; but Russia and Austria had cast their eyes upon this country, with a view, in imitation of what had been done in 1772, of seizing its best provinces; and the king of Prussia now found it necessary to acquiesce in the project. And the state of France at this period held out strong temptations for the formation of a similar project respecting it. Leopold, emperor of Germany, had a fair excuse for interfering in French affairs, namely, to rescue the king from the state of thralldom to which he had been reduced by his subjects; and the other princes of Europe had become alarmed at the example set by France, of limiting the authority of the monarch, of destroying the privileges of the nobility, and of reducing to a level all classes of persons in the state. The united powers of the north, therefore, now resolved to restore the French king and his nobles, but at the same time determined to divide among themselves and their allies some of the provinces of France. Towards the close of the summer 1791 these points were adjusted, at a conference held at Pillnitz in Saxony, between the emperor Leopold and the king of Prussia. The treaty entered into was intended to be kept secret; but the substance of it soon transpired, and afterwards, by the hatred which it excited in the French nation, proved the cause of important events. Its general object is understood to have been the dismemberment of Poland, and also of part of France. Poland was to be divided among the three great military powers in different portions. With regard to France, the emperor was to obtain Bavaria in exchange for the French Netherlands, which he was to conquer, and transfer, along with the Austrian Netherlands, to the elector of Bavaria. The Archduke Charles was to obtain the duchy of Lorraine; Strasburg and Alsace were to be restored to the empire; the king of Sardinia was to receive Dauphiné, if he acceded to the coalition; Spain, on the same condition, was to be accommodated with the French portion of the island of St Domingo, with Corsica, Rousillon, and Bearn; and

the Swiss cantons, if they became parties to the coalition, were likewise to receive certain territories. This treaty was publicly disavowed; but it was nevertheless universally believed throughout Europe to have been entered into, and was accordingly talked of under the appellation of the "Concert of Princes."

Parliament assembled on the 31st of January 1792, and a variety of uninteresting debates occurred, the principal of which related to the armament which had been fitted out on account of the dispute with Russia concerning the fortress of Oczakow. During the preceding autumn, the Duke of York, second son of the king, had married a daughter of the king of Prussia. This prince was believed to be a favourite son; and as the marriage in question had been contracted, not from political considerations, but the private choice of the parties, it gave general satisfaction. A provision of L.37,000 per annum was readily made by parliament for the royal pair. On the 17th of February Mr Pitt brought forward a statement of the public revenue, from which it appeared that nearly half a million might be applied towards the extinction of taxes, or the payment of the national debt; and this was accordingly done; the additional tax recently laid on malt, the taxes on female servants, on carts and waggons, and on houses under seven windows, and part of the duty on candles, being those repealed. On the 2d of April the question of the slave-trade was again brought under the consideration of the House of Commons by Mr Wilberforce. He disclaimed any project of emancipating the negroes, but contended that, by the abolition of the importation of new slaves, the state of those in the West Indies would be improved. The slave-trade was defended on this occasion by Colonel Tarleton and Mr Jenkinson; while Mr Wilberforce was supported by Mr Montague, Mr Whitbread, and Mr Milbank. Mr Dundas professed himself a friend to the abolition, but entertained doubts with respect to the mode of effecting it. Mr Addington agreed in opinion with Mr Dundas. He thought the trade ought to exist for some years longer, and therefore could not vote for an immediate abolition. Mr Fox deprecated every kind of deception or delusion practised upon the country, and reprobated in strong terms Mr Addington's views of the subject. Mr Dundas moved, as an amendment to Mr Wilberforce's motion, that the trade should be abolished gradually; and although Mr Pitt declared his disapprobation of the amendment, the motion for a gradual abolition was carried by a considerable majority. Soon afterwards Mr Dundas stated the regulations which he meant to propose for the gradual abolition of the trade. The chief of these consisted in increasing the duties upon the age of the negroes imported; abolishing the trade as far as not necessary for the supply of our own islands; limiting the tonnage to be employed in it; punishing British subjects guilty of crimes in carrying it on; and providing that the importation of negroes into the British colonies should cease on the first of January 1800. Mr Wilberforce disclaimed all acquiescence in these propositions; and Mr Fox ridiculed them, by asking where the baptismal register was kept on the coast of Africa, by which the age of those who were to be exported could be ascertained. A variety of amendments were now proposed; and it was at length agreed that the period of abolition should be fixed for the first of January 1796. In the upper house the advocates of abolition were less successful; and they were not a little provoked at finding one of the younger branches of the royal family, the Duke of Clarence, now William IV., declaring himself decidedly hostile to their wishes. It was ultimately resolved that evidence should be heard at the bar, which necessarily produced delay, and little or no progress was made during the rest of the session. On the 18th of April

Reign of George III.

Reign of
George III.

Mr Sheridan moved for an inquiry into certain grievances complained of by the royal burghs of Scotland, fifty out of the sixty-six having concurred in the petition upon which Mr Sheridan grounded his motion. The motion was resisted by Mr Anstruther, Mr Dundas, and Sir J. St Clair Erskine, upon the general ground that no serious grievance existed; and the inquiry was refused by a large majority. Excepting some debates relative to the French revolution, nothing further of any importance occurred during the present session.

That we may not afterwards have occasion to interrupt the detail of the transactions connected with the state of affairs in France, we shall here notice the war in India, and which was now brought to a fortunate termination. The western side of the peninsula of Hindustan consists of a level country for upwards of seventy miles inwards. Behind this tract, and parallel to the ocean, runs a chain of lofty mountains, presenting a front towards the west, broken into tremendous precipices, but on the other side consisting of an extensive plain, gradually descending eastward to the Bay of Bengal, and forming the territory of the Mahrattas, Mysore, Madras, the Carnatic, and other states. Now as Tippoo Sahib possessed territory on both sides of these mountains, which are denominated Ghauts, from the narrow paths or passes by which they are crossed, the army of the Carnatic, under General Meadows, was directed to attack this territory from the east; the Bombay army, under General Abercromby, was to reduce the country to the westward of the Ghauts; the Mahrattas, and the nizam of the Deccan, agreed to attack Tippoo's country on the north and north-east, where it bordered on their own territories; and Seringapatam, his capital, was fixed upon as the point towards which the whole of the hostile armies were to direct and concentrate their efforts. On the 15th of June 1790, General Meadows entered Tippoo's country. The grand army on this occasion amounted to fourteen thousand effective European troops, a body of men which no power in India could encounter in the field. A variety of operations occurred; but little appears to have been effected towards the subjugation of the enemy, except the capture of the country to the westward of the Ghauts, till the end of February 1791, when Lord Cornwallis assumed the command in person. His first operation was directed against Bangalore, which he reached on the 5th of March; and a practicable breach having been made in the walls, the fort was stormed on the 21st, with little loss to the British. Of the garrison not less than a thousand were bayoneted, and a small number taken. Being joined by above fourteen thousand of the nizam's troops, and seven hundred Europeans, with four thousand five hundred and eighty troops under Colonel Oldham, Lord Cornwallis proceeded towards Seringapatam, where he arrived on the 13th of May, after a difficult march in bad weather over a hilly and barren country. Tippoo lost no time in displaying a considerable force in the field, with the view of covering his capital; but being beaten, though with little loss, he was forced to retire within the walls of Seringapatam, which, defended by a river at this season swelled with the rains, seemed secure against attack. In fact, circumstances had completely defeated the object of the combined operation which had been so ably projected. Lord Cornwallis was in want of provisions for supporting his army during a protracted siege; and as General Abercromby had not been able to join him from the west, it was judged expedient to retire to Bangalore, after destroying the battering train. On his retreat Lord Cornwallis was joined by the Mahrattas to the number of about thirty thousand. General Abercromby also retired across the Ghauts with a fatigued and dispirited army; and thus for the present Tippoo escaped a siege in his capital.

After his retreat, Lord Cornwallis employed himself for some time in reducing various small forts in the neighbourhood of Bangalore, some of them of such natural strength as, in any other hands but those of the feeble natives of that country, to be absolutely impregnable. Nundidroog, built on the summit of a mountain 1700 feet in height, three fourths of which are altogether inaccessible, fell after a siege which lasted from the 22d of September to the 18th of October; the place being assaulted by a breach at midnight, and taken, though not by surprise. The fortress of Savendroog, eighteen miles to the westward of Bangalore, was still more strongly situated. It stood on the summit of an insulated rock, rising about half a mile in perpendicular height, from a table or base of eight or ten miles in circumference, and divided at its summit into two hills, each having its peculiar defences, capable of being maintained independent of the lower works; while the whole was surrounded by a strong wall, with cross walls and barriers in every accessible part. Yet this stupendous fortress was taken in ten days.

In December, General Abercromby once more crossed the Ghauts, and proceeded eastward towards Mysore; while Lord Cornwallis, in the beginning of February 1792, advanced from Bangalore, and arrived on the 5th within sight of Seringapatam. Tippoo Sultan occupied a position under the walls, and there resolved to make a stand in defence of his capital. On the 6th, at eight o'clock in the evening, the attack was made on the sultan's camp. After a sharp engagement at different points, parties of the British crossed the river, and established themselves in the island on which Seringapatam stands. This movement proved decisive. Tippoo, finding himself in danger of having his retreat intercepted, was compelled to retire; and being pressed by the invaders on all sides, while his palace and gardens were in their possession, and his power reduced within the narrow limits of a fortress, he found it necessary to endeavour to purchase peace upon almost any terms. With this view he released two prisoners, Lieutenants Chalmers and Nash, and requested the former of these gentlemen to present a letter from him to Lord Cornwallis. The operations of the siege, however, still continued, and, on the 19th of February, the trenches were opened; whilst the Bombay army, under General Abercromby, invested the western side of the capital. But a cessation of hostilities was agreed to on the 23d of February, and a treaty of peace concluded, by which it was stipulated, first, that Tippoo was to cede one half of his dominions to the British and Indian powers; secondly, that he was to pay in money three crores and thirty lacs of rupees; thirdly, that all prisoners were to be restored; and fourthly, that two of the sultan's sons were to become hostages for the due performance of the treaty. On the 26th, the two princes, each mounted on an elephant, richly caparisoned, proceeded from the fort to Lord Cornwallis's camp, where they were received by his lordship with his staff. The eldest, Abdul Kallich, was about ten, and the youngest, Mooza-ud-deen, about eight years of age; and they were dressed in long white muslin gowns, with red turbans richly adorned with pearls. Educated from infancy with the utmost care, the spectators were astonished to behold in these children all the reserve, politeness, and attention, of maturer years. The kindness with which they were received by the British commander appeared to afford them satisfaction; some presents were exchanged; and the scene is described by an eye-witness as in the highest degree interesting. It was the 19th of March before the definitive treaty was finally adjusted, and delivered by the young princes into the hands of Lord Cornwallis.

In the meanwhile scenes of unparalleled interest were

about to be exhibited in Europe. These were produced by two causes; the ambition of the great military powers, and the French revolution. When, by an abuse of that policy which had once produced a vigilant attention to the balance of power, Russia and Austria had formed the project of extending their dominions, and when Prussia, probably nothing loth, found it expedient to concur in their policy, it became evident that the situation of Europe must speedily undergo great changes; whilst the French revolution, which had reduced that once powerful monarchy to a state of complete debility, seemed to afford an opportunity for the extension of the system of spoliation, by enabling the great powers to regard its ample territories as a further subject of partition. In another point of view, however, this revolution had now begun to be an object of no small alarm. The distinguished place which France had held among the nations of Europe rendered the late change of her government an object of universal attention; and there was a danger that it might come to be regarded as an object of imitation. The public discussions which took place in her national assemblies, and in printed publications, were conveyed, through the medium of a language universally understood, to the most obscure corners of Europe; and kings, nobles, and priests, became apprehensive that the contagion of innovation might not be confined to the country in which it had originated. Hence a general wish prevailed among the ruling classes that an effort should be made, before it was too late, to overwhelm the country from which so much danger to established governments was anticipated. Nor was this alarm altogether groundless. Men had almost everywhere outgrown their institutions; and whilst the former had been rapidly advancing, the latter remained stationary. The diffusion of wealth and of knowledge had created new interests, and led to the formation of new opinions; whilst a new class, formerly considered by rulers as of little or no importance whatever, except as subjects of taxation or instruments of ambition, was gradually and steadily rising into importance. The power of the nobility was rapidly passing away. The establishment of standing armies rendered them of little importance in war; and their wealth, as the great landholders of Europe, was daily more and more eclipsed by the opulence of the industrious classes; while, though titles of honour still remained, the estimation in which they were held was from various causes much diminished. But prodigious abuses remained. In those states which in former times had resisted the innovations produced by religious zeal, a wealthy priesthood and monastic orders still existed. The privileges of the nobles and of the clergy rendered taxation unequal; and commerce was embarrassed by restrictive laws and the privileges of old incorporations. There was therefore much to be reformed among the continental states of Europe, and the desire to obtain this reform was daily increasing.

In France, though the house of Bourbon had supported the Roman Catholic religion, yet, upon the whole, they were of a much more liberal spirit than any other royal family in Europe, and had given greater encouragement to letters, and to every kind of improvement. It is not wonderful, therefore, that the desire for improving the condition of mankind, and simplifying the arrangements of society, which had been so successfully pursued in other countries, should have become extremely prevalent in France. Unfortunately, however, though the character of the reigning monarch led him to encourage such projects, yet his undecided and inactive spirit, together with the embarrassed state of the finances, prevented him from taking the lead in these changes, or from repressing them when inordinately pursued by others. Meanwhile the example of prosperity enjoyed under the free constitution of Great

Britain, and the pride of having recently contributed to the establishment of a republican government in North America, fixed the character of any changes of a political nature, which at this period originated in France, whether among men of letters, the army, or the people at large. But in forming a political constitution, the vanity of the French, which induced them to avoid the appearance of servile imitation, had unhappily led them to differ in one most essential point from the British constitution. Their legislature consisted only of a king and a single house of representatives; whereas in Britain, by means of an intermediate estate, that of the peerage, naturally jealous of popular innovation, laws injurious to the royal prerogative are prevented from being enacted without the king being involved in dispute with the Commons. But in France the king himself was under the necessity, in such cases, of preventing the passing of the law, by personally interposing a negative; that is, he was placed in the unpopular and absurd situation of opposing his single judgment to the united will of a nation, and that too in perilous and critical times, when he could not fail to be suspected of disliking a constitution by which his power was taken away. Still, however, the representative government of Britain had been the model on which the French proceeded; and there is no doubt that they expected, during any contest in which they might be involved with the powers of the Continent, that they would enjoy, if not the support, at least the neutrality and favourable countenance of the British nation. But, on the other hand, the passion for innovation which seized the French nation, had in many instances proceeded to extravagant lengths; and there was reason to anticipate, on the part of the court of London, some alarm lest this passion might communicate itself in an inconvenient degree to Britain, where, though political abuses were less flagrant, and the passion would consequently find less food for its exertion, enough might yet exist to kindle disturbances and produce anxiety.

In the month of April 1792 a society was instituted in London, at the head of which appeared Mr Grey, Mr Baker, Mr Whitbread, Mr Sheridan, Mr Lambton, Mr Erskine, and several other distinguished members of parliament, for the purpose of obtaining a reform in the representation of the people. The association assumed the title of "The Friends of the People;" and it was speedily joined by some respectable characters in the commercial and literary world. Similar societies had, at former periods, existed in Great Britain; and the Duke of Richmond, Mr Pitt, and others, while they zealously advocated parliamentary reform, had attended meetings, not merely of persons acting in their individual capacity, but of persons appearing as delegates from other societies. At the present period, however, government appears to have regarded any association of this kind as unusually dangerous. The society had resolved that, early in the ensuing session, a motion should be brought forward in the House of Commons for a reform of parliament; and that the conduct of the business should be committed to Mr Grey and Mr Erskine; and, in conformity with the intentions of the association, Mr Grey, on the 30th of April, gave notice in the house of a motion which he intended, next session, to submit to their consideration, for a reform in the representation of the people. Its necessity, he said, had been admitted both by Mr Pitt and Mr Fox. The times were indeed critical, and the minds of the people agitated; but his object was to tranquilize them, by removing every cause of complaint. Mr Pitt declared, with unusual vehemence, that he objected both to the time and the mode in which this business was brought forward; that the present was not a time to make hazardous experiments; and that he saw with concern, gentlemen who

Reign of.
George III.

Reign of
George III.

might only desire an amelioration of our institutions united in an association with others who professed not reform only, but direct hostility to the very form of our government, and who threatened the extinction of monarchy and every thing which promoted order and subordination in a state. Mr Fox declared himself satisfied concerning the necessity of a reform in the representation, but that he never entertained very sanguine hopes of its accomplishment. Had his honourable friend consulted him, he should have hesitated in recommending the part he had taken; but having taken it, he could not see why the period was improper for the discussion. He professed a strong attachment to the British constitution, but did not regard this as the only free country in the world. After a tumultuous debate, in which Mr Burke and Mr Wyndham opposed Mr Sheridan and Mr Erskine, the subject was dropt. In the mean time a variety of political pamphlets daily appeared, the most remarkable of which was a publication by Thomas Paine, entitled *The Rights of Man*. This being a direct and inflammatory attack upon the whole principles and practice of the British constitution, administration thought fit to issue a royal proclamation against the publishing and dispersing of seditious writings; enjoining the magistrates to exercise vigilance in attempting to discover the authors of such writings, and exhorting the people to guard against all attempts which aimed at the subversion of regular government. It is not easy to perceive what precise purpose government intended to serve by this proclamation. The authors of the seditious publications alluded to did not conceal themselves; and the publications were openly sold without any attempt to suppress them by prosecutions. Perhaps it was intended to prepare the minds of men for future measures of direct hostility against France; perhaps it was only meant to rouse in the friends of government a spirit of opposition to the schemes of innovation which were at this time afloat. But whatever object administration might have in view, the effect of their proclamation was to excite general curiosity, and to serve as a public advertisement to the dangerous writings of Thomas Paine and others. In all parts of the island multitudes of persons, who had not hitherto interrupted their ordinary occupations to attend to the transactions of the Continent, or the speculative discussions which the present state of France had excited, were now seen crowding to the shops of booksellers inquiring for the treatises, the names or titles of which they knew not, against which the king's proclamation had issued; every printing press in the kingdom was occupied, and copies could scarcely be supplied in sufficient abundance to satisfy the demand. Nor did the folly of government stop here. On the 25th of May the master of the rolls moved an address to his majesty, in pursuance of the proclamation, the object of which he admitted to be Mr Paine's works; and having read an extract from one of the pamphlets of that writer, importing that all kings were tyrants, and their subjects slaves, he complained of the circulation of such publications. Mr Grey asserted that the minister, apprehensive of the effects of the association of the friends of the people, had concerted this measure with an insidious view of separating those who had long been connected; and alleged that such sinister practices were delighted in by a gentleman whose political life was a tissue of inconsistency, and who never proposed a measure without intending to delude his hearers. Mr Fox disapproved of the proclamation, because it was insidious and ambiguous, tending to propagate vague and unnecessary alarm. Mr Pitt did not impute any improper design to the new association; but it might be taken advantage of by ill-disposed persons, who, under the shelter of a respectable body, might push forward their own

sinister designs. The plan of the persons to whom he alluded was evidently to overturn the monarchy, and convert the kingdom into a republic. The address to the throne was agreed to without a division. In the House of Lords, on the 31st of May, a similar address was voted after some debate; and parliament was prorogued a short time afterwards.

The eyes of all Europe were now turned towards France; and the combination which the continental monarchs were known to have formed against that country was expected speedily to issue in action. The king of Sweden, who was fond of war, having now settled all disputes with Russia, offered to lead in person the armies of the combined powers, to destroy in France those new institutions and opinions which threatened to subvert the whole ancient system of public order in Europe. But continuing at variance with his nobility, he was assassinated at a masquerade on the 16th of March, by an enthusiast of the name of Ankerström, who boasted, on being seized, that he had liberated his country from a tyrant. In the meanwhile Leopold, emperor of Germany, had also died, and been succeeded by his son Francis II. Leopold had chosen to temporize with France; but his successor thought it unnecessary to observe any measures of caution with that country. On some remonstrances being made by the French government against his permitting troops to assemble on the frontiers, he avowed the concert of princes against the constitution of France, and stated it to be one of the conditions necessary to the preservation of peace, that the neighbouring powers should have no reason for the apprehensions which arose from the present weakness of the internal government of France. This acknowledged intention to interfere in the internal affairs of the French nation produced a proposal on the part of the French king to the national assembly, which was readily acceded to, for declaring war against the king of Hungary and Bohemia; and in a short time war was in like manner declared against Prussia and Sardinia.

In the meanwhile, though the combined princes had not probably as yet completely adjusted their respective shares of the spoils of France and Poland, yet, that the latter might be kept in a state of weakness, and that all traces of the new principles might as far as possible be obliterated, the empress of Russia gave notice of her determination to invade Poland with an army of a hundred and fifty thousand men, for the purpose of overturning the new constitution. No provision had been made by the king to resist such a force; but an attempt was made by Kosciusko, a Polish nobleman, who had served under General Washington in America, to defend the independence of the country; and some battles were, in consequence, fought. But the Russians continued to advance; and on the 23d of July the king, despairing of the result of the contest, submitted without reserve to Russia, and consented to the restoration of the old constitution, with all its weakness and anarchy.

While the combined princes were thus successful in the north, a very different fate awaited their efforts against France. The French king and his ministry caused the Austrian Netherlands to be invaded; and four different detachments under Lafayette and other generals were directed to enter that country at different points. They made some progress, but their raw troops were speedily repulsed; and when Prussia and Austria, who had undertaken the extinction of the revolution in France, had completed their preparations, the Duke of Brunswick was appointed commander of the combined armies. In a long manifesto issued by the emperor and the king of Prussia, they thought it necessary to disclaim all views of aggrandisement, or interference in the internal administration of

Run of France; but they declared themselves resolved to re-establish in that country public security, meaning the ancient order of things, and to protect the persons and property of all loyal subjects; threatened to punish as rebels all who resisted them; and declared their determination to give up the city of Paris to the most terrible vengeance if the least insult were offered to the king, the queen, or the royal family. The Duke of Brunswick also issued a manifesto, in his own name, dated from his head-quarters at Coblenz, in which he declared that the two allied courts had no intention to make conquests in France, and that they intended merely to deliver the king from captivity, and to restore his authority; he promised protection to all who submitted to the king, required the national guards to protect the public safety till further orders, and threatened to treat those who resisted him in arms as rebels to their king; enjoined the officers and soldiers of the French regular troops to submit to their legitimate sovereign; declared the French magistrates responsible, on pain of losing their heads and estates, for every disorder which they should not have attempted to prevent; menaced with death the inhabitants of towns and villages who should defend themselves against his troops, but promised protection to those who should submit; called upon the city of Paris to yield instantly to the authority of the king; declared the members of the national assembly, and the magistrates and national guards of Paris, personally responsible for disobedience, and amenable to military law; threatened, on the word of the emperor and king, if the palace of the Tuilleries were forced, or the least outrage offered to the king, queen, and royal family of France, or if they were not immediately placed in safety and set at liberty, to inflict the most exemplary punishment, by giving up the city of Paris to military execution; and declared that no other laws could be acknowledged in France, excepting those derived from the king, who was invited to repair to a frontier town, where he might provide for the restoration of order, and the regular administration of his kingdom.

This fatal manifesto had no sooner been published than all France was in commotion. The insolent language employed by two foreign powers, one of which had for ages been regarded with a sort of hereditary hostility, wounded the pride and the patriotism of every Frenchman; many who were enemies of the revolution could not brook an open attack upon the national independence; the zeal of those who had been enthusiastic promoters of freedom was kindled into absolute frenzy; and multitudes from all quarters hastened to the frontiers to share the danger of protecting the independence of their country. Unhappily for the monarch, the enemies of the nation had loudly declared themselves as his friends; and the restoration of absolute power was made the excuse for a hostile invasion of France. The king, therefore, and all who were attached to him, became objects of public hatred. The republican party had previously been small, but every hour now procured it a fresh accession of strength; and as it appeared dangerous to intrust the national defence to the hands of the king, it was resolved to get rid of his authority altogether. He was therefore dethroned on the 10th of August, and a republic proclaimed; and soon afterwards the capital became the scene of a sanguinary massacre of those persons who had been imprisoned on suspicion of adhering to his cause.

The Duke of Brunswick was, in the mean time, advancing into the heart of the country at the head of the combined army. Verdun and Longwy had surrendered to his arms in the end of August, and by this time he had reached the neighbourhood of Chalons. But he had met with opposition at every step of his progress; and the people of the country had removed all kinds of provisions from the

course of his march, while the French army under Dumouriez was supplied with every necessary. At length, as the French daily acquired discipline, General Kellerman was able to sustain at Valmy, with sixteen thousand men, an attack which, though made by a superior force, and persevered in for fourteen hours, effected nothing. Unable to make any serious impression on the raw levies opposed to it, the combined army also suffered by disease, which thinned its ranks; whilst the French were rapidly augmenting in numbers and courage; so that the advance to Paris, which seems to have been regarded as a sort of holiday promenade, became an achievement beyond the power of the invaders to execute. The king of Prussia was personally present with the army, and enabled to judge of the difficulties as well as dangers of his position. A war of the people revealed itself to his astonished view; and he perceived, that before he could accomplish the object of the coalition, he must not only conquer an army animated with an enthusiastic spirit of patriotism, but subdue a whole nation, ready to rise in mass to resist the aggression on its territory. The prospect was abundantly gloomy; and his Prussian majesty was appalled by it. Accordingly a retrograde movement was commenced without any attempt being made to penetrate farther into the country; and some suspicions were at this time entertained by discerning men, that France would not have much to dread from the obstinate hostility of the king of Prussia. After his retreat, the French, with wonderful activity, commenced offensive operations. In October General Custine reduced Mentz; in the same month Dumouriez invaded the Netherlands; on the 4th of November he fought the celebrated battle of Jemmappes, in which the Austrians were defeated; and as the emperor Joseph II., trusting to his alliance with France, had demolished the fortifications of the towns in the Netherlands, excepting Luxembourg and the citadel of Antwerp, the whole of that country, as far as the frontiers of Holland, now fell into the hands of the French. After the victory of Jemmappes, the government of the French republic, in order to conciliate the inhabitants of the Austrian Netherlands, resolved to open the navigation of the river Scheldt, which for some centuries had been kept shut by the jealousy of the Dutch, and thus to revive the trade of Antwerp, anciently one of the first commercial cities in Europe; and at the same time, in order if possible to counteract the combination of princes which had been formed against them, and which was now rapidly extending itself, the convention endeavoured to represent theirs as the cause of the people in every country, in opposition to that of their princes or hereditary rulers, who were denominated tyrants. Accordingly, on the 19th of November, the convention passed a decree, declaring, that they would give assistance, by means of their armies and otherwise, to every people who should attempt to establish a free government for themselves; and two months afterwards, the same body, by a majority of votes, ordered their imprisoned monarch to be put to death upon an accusation of having betrayed the cause of the nation.

The important transactions which were now taking place on the Continent produced a powerful impression upon the British nation, where the minds of men, as already remarked, had been directed to political questions by the royal proclamation against seditious publications. According as the sentiments of individuals varied, they perused with terror or with satisfaction the Duke of Brunswick's manifesto. Men of a patriotic character, however, whatever their political opinions might be, were not dissatisfied to see a nation capable, even amidst great public confusion, of repelling an invasion by the best disciplined armies, conducted by the most experienced commanders in Europe. But the

Reign of
George III.

horrid massacres which took place in September, together with the treatment of the royal family, excited very different sentiments, and were justly regarded as instances of unparalleled barbarity and wanton bloodshed; and the general result was, that by the months of August and September the whole British nation was in a most agitated state. In all companies, questions as to the comparative merits of monarchical and republican government, together with the propriety of a reform in the British House of Commons, formed the subjects of conversation; and persons of every rank entered into these discussions with singular eagerness. At the commencement of the revolution, very few had any idea that a republican government would be found practicable in France; and with regard to Britain, which enjoyed a sound administration of justice and much internal prosperity, no change whatever seemed necessary. But, in proportion as the French proved victorious, a republican government seemed less and less impracticable; and, as the subject of political abuses was canvassed, new ideas concerning the state of government in Britain began to be entertained. The scenes of tumult and corruption which occurred at elections, the inattention of parliament to the petitions for the abolition of the slave-trade, the memory of the coalition, and the reproach under which the House of Commons since that time had fallen, induced many to think a reform in the representation of the people absolutely necessary. New notions were daily broached at home, or imported from the volcanic region of France; and one in particular, that of the boundless perfectibility of the human mind, which is so true in theory, but so false in fact, became extremely prevalent, and gained singular favour. Men of science or benevolence, who judged of others from the rectitude of their own intentions; men of ardent imaginations, who believed every thing practicable to their unbounded zeal; and the young and inexperienced, who were unacquainted with the imperfections of the human character; all imagined that the period had arrived when mankind, become rational and just, were no longer to engage in wars of ambition,—when good sense alone was to rule the world,—and when the public business of society, reduced to the narrow limits of administering justice, and constructing high roads, harbours, and other works of internal improvement, might be conducted with little trouble, and without the establishment of different ranks and orders of men, or the display of military force for the preservation of public tranquillity. In short, a species of delirium upon political subjects prevailed; and mankind were led to believe that the greatest changes in the order of society might be accomplished with facility and safety.

Besides the society called the Friends of the People, other associations of less distinguished persons, called the Constitutional and Corresponding Societies, were established in London; and during the autumn societies assuming the name of Friends of the People were established in most towns and villages throughout the country, for the avowed purpose of bringing about a reform of parliament. In proportion, however, as the character of the French revolution began to display itself, in the sanguinary scenes which were daily enacted, and in the extravagant projects and sentiments which were entertained, persons of rank and property became alarmed. In the month of November an association was instituted at the Crown and Anchor tavern in London, the avowed object of which was the protection of liberty and property against the attempts of republicans and levellers; and similar associations for the support of government were set on foot in other parts of the metropolis, and throughout the country.

Parliament assembled on the 13th of December 1792. The speech from the throne intimated that his majesty

had judged it necessary to embody a part of the militia, and to assemble parliament previous to the time fixed for that purpose; and stated, as the causes of these measures, the seditious practices which had been discovered, and the spirit of tumult and disorder, shown in acts of riot and insurrection, which required the interposition of a military force in support of the civil magistrate. His majesty asserted, that he had observed a strict neutrality in regard to the war on the Continent, and had uniformly abstained from any interference with respect to the internal affairs of France; but that it was impossible for him to see, without the most serious uneasiness, the strong and increasing indications which had appeared there of an intention to excite disturbances in other countries, to disregard the rights of neutral nations, to pursue views of conquest and aggrandisement, and to adopt towards his allies, the States-general, measures which were neither conformable to the law of nations, nor to the positive stipulations of existing treaties. Under these circumstances he felt it his duty to have recourse to the means of prevention and internal defence with which he was intrusted by law, and to take the necessary steps for augmenting the naval and military force of the kingdom.

When the usual address was moved in the House of Commons, Lord Wycombe opposed it, on the ground that the speech from the throne had calumniated the people of England; that, so far from any spirit of insurrection existing, the kingdom was on the contrary overflowing with loyalty; that speculative political opinions had always been agitated under the free constitution of Britain; and that the persons who were thought most disaffected wished merely to reform that constitution. Mr Fox declared that the present was the most momentous crisis that he had ever read of in the history of this country; and that on the conduct of parliament depended, not merely the fate of the British constitution, but that of doctrines affecting the happiness and well-being of all human kind. He affirmed, that there was not a fact stated as such in the speech from the throne which was not false; he denied the existence of any insurrection; he justified the exultation which many persons had expressed on account of the retreat of the Duke of Brunswick; he described the calling out of the militia as a fraud, intended to induce the people to believe that cause of alarm existed, and thereby to bring them more completely under the influence of government; he treated the opening of the Scheldt as no just cause of war; and he recommended the removal of acknowledged grievances, as the certain means of appeasing the discontent of the people. Mr Windham now deserted the opposition, and joined administration in contending that there existed great danger to the constitution. He also declared his approbation of the march of the combined armies into France. Mr Dundas asserted, that under the pretext of reform, the example of France had been held out for imitation to the people of this country; and that the object of the French was evidently the aggrandisement of their dominions. Mr Sheridan denied the existence of any just cause of alarm, and declared that he would vote for the impeachment of any English minister who should enter into a war for the purpose of re-establishing the former despotism in France, or who should dare, in such a cause, to spend one guinea, or shed one drop of blood. From the commencement of Mr Pitt's administration a considerable number of members of parliament, the remnant of the coalition, had remained in opposition to his measures. But in consequence of the alarm which had at this time diffused itself among persons of high rank, and perhaps also as a plausible excuse for deserting a fruitless and unprofitable opposition, a great number of the members of the party hitherto hostile to administration now joined

Reign of
George III.

Reign of George III. in supporting those measures which they perceived to be agreeable to the executive power. Accordingly, on a division there appeared for the address two hundred and seventy, and for the amendment only fifty. In the House of Lords similar debates took place upon the address, and opposition also experienced a desertion of part of its members. The Duke of Norfolk, the Marquis of Lansdown, Lord Rawdon, afterwards Earl of Moira and Marquis of Hastings, and Earl Stanhope, declared themselves averse to war; whilst Lord Grenville, Lord Stormont, the Marquis Townshend, and others, supported the sentiments expressed in the king's speech.

After the French king had been dethroned, Earl Gower the British ambassador was recalled; but the French ambassador, M. Chauvelin, still continued to reside in London. On the 15th of December Mr Fox moved that a minister should be sent to Paris to treat with the provisional executive government of France; declaring, that by this motion he meant not to approve of the conduct of the French government, but simply to record it as his opinion, that it was the true policy of every nation to treat with the existing government of every other nation with which it had relative interests, without regarding how that government was constituted; and that we could have no stronger objection to the existing government of France, than to the governments of Algiers and Morocco, in both of which countries we had resident consuls. This motion gave rise to a very animated debate, in which the opposition were accused of desiring to encourage discontent and sedition, and were defended by Mr Taylor, Mr Grey, and Colonel Tarleton. But Mr Fox's motion was negatived.

On the 19th of December Lord Grenville introduced into the House of Lords what has been called the alien bill, authorizing government to dismiss from the kingdom such foreigners as they might think fit, and which passed after some opposition from the Earl of Lauderdale and the Marquis of Lansdown. On the 28th of December Mr Secretary Dundas urged the House of Commons to adopt the alien bill, on account of the extraordinary influx of foreigners into the country, and the dissatisfaction of persons at home. Sir Gilbert Elliot, in supporting the bill, expressed his regret at being under the necessity of differing from his former political associates; and Mr Burke, as usual, spoke with very great vehemence on the subject. I vote, said he, for the present bill, because I consider it as the means of saving my life, and all our lives, from the hands of assassins. When they smile, I see blood trickling down their face; I see their insidious purposes; I see that the object of all their cajoling is blood. I now warn my country to beware of those execrable philosophers, whose only object is to destroy every thing that is good here, and establish immorality and murder by precept and example. While the alien bill was under consideration, another measure allied to it in principle was introduced; namely, a bill to prevent the circulation of assignats and other paper money under the authority of France. During the month of December an order of council was also issued for preventing the exportation of corn to France, and some ships which had grain on board were compelled to unload. On the 26th of December an act of indemnity passed upon the subject.

Affairs were now fast hastening to an open rupture with France. On the 17th of December M. Chauvelin transmitted a note to Lord Grenville, one of the secretaries of state, in which, in the name of the executive council of the French republic, he demanded to know whether his Britannic majesty was to be considered as a neutral or a hostile power. No wish, he said, existed on the part of France to entertain any doubt upon the subject; and they even desired to answer previously all those reproaches which

might be thrown out against them. With regard to the decree of the French convention of the 19th November, it had been misinterpreted. The French republic did not intend to favour insurrections in neutral or friendly states; and the decree applied only to those people who, after having acquired their liberty, might request the assistance of the French republic by a solemn and unequivocal expression of the general will. As to the neutrality of Holland, it would be respected while that power confined itself within the bounds of strict neutrality; and with regard to the opening of the Scheldt, it was a question irrevocably decided by reason and justice. It was added, that on the fatal supposition of a war being resolved on, whilst the intentions of France were thus peaceful and conciliatory, the whole weight and responsibility of it would sooner or later fall on those who had provoked it.

Lord Grenville's answer to this note, which bears date 31st December 1792, disclaimed considering M. Chauvelin in any other public character than that of minister from his most Christian majesty. It denied that the decree of the 19th November was satisfactorily explained, as the promoters of sedition in every country might still have in view the case in which they might count beforehand on the support of France. It affirmed that the neutrality of Holland had already been violated; and that the unimportance of the Scheldt would only render the opening of its navigation a clearer proof of the existence of an intention to insult the allies of England by violating their rights, which were guarded by the faith of treaties.

An official note from the executive power of France was transmitted through M. Chauvelin in reply to Lord Grenville's answer, in which another effort was made to explain the obnoxious decree of the 19th November. In this document all intention of effecting a conquest of the Netherlands was disclaimed; and it was added, that if the Belgians, from any motive whatever, consented to deprive themselves of the navigation of the Scheldt, France would not oppose it. In an answer to this note by Lord Grenville, these explanations were declared to be unsatisfactory. On the 17th of January M. Chauvelin sent to Lord Grenville his credentials as ambassador from the French republic; but on the 20th of the same month Lord Grenville sent him a letter refusing to receive his credentials, or to consider him in any other character than as one of the mass of foreigners resident in England; and on the 24th his lordship sent M. Chauvelin a passport for himself and his suite, declaring that, after the fatal death of his most Christian majesty, he could no longer be considered as holding any public character in Britain.

In consequence of this correspondence the French convention declared war against England and Holland on the first of February; three days previous to which Mr Secretary Dundas presented to the House of Commons a message from the king, announcing that copies of the papers now mentioned were laid before the house. It was added, that his majesty thought it necessary to make a further augmentation of his forces by sea and land; and that he relied upon the zeal of the House of Commons to enable him to take the most effectual measures for maintaining the security of his dominions, supporting his allies, and opposing the ambition of France, at all times dangerous, and peculiarly so when connected with the propagation of principles utterly subversive of the peace and order of civil society. And thus Britain became a party in the most sanguinary and eventful war that ever desolated Europe or afflicted humanity. In the month of April the French government made another attempt to enter into negotiations, and the minister, Le Brun, transmitted to England by a private gentleman letters to Lord Grenville, in which he requested passports for M. Maret to repair

Reign of George III. to Britain in order to negotiate peace; but no public notice whatever was taken of the application.

In the quarrels of nations the real causes and motives of hostility are often very different from those which are ostensi-

sibly held out to the world: It was for some time customary in Great Britain to dispute with great eagerness the question as to who were the aggressors in this war; and in such disputes the friends of administration laboured under considerable difficulties, in consequence of the narrow ground upon which government had thought fit to rest the grounds or causes of hostility. The French government had been willing to explain away the offensive decree of the 19th November; the question about the Scheldt they were prepared to give up; and their ignorance of the nature of the British constitution, and of the elements which influence it in practice, prevented them from entertaining any idea that they were likely to encounter hostility from this country arising out of their revolution. Hence they not only neglected their navy, but had already in some measure ruined it, by sending their seamen to the frontiers in the character of soldiers. But though the French had not originally entertained hostile designs against this country, and though the ostensible causes of war on the part of Great Britain were weak, if not futile, it does not therefore follow that the motives which actually influenced the conduct of the British government on this occasion partook of the same character. France had been the ancient and dangerous enemy of England. She had suddenly fallen into a state of anarchy and consequent debility. All Europe was now leagued against her. Within she was divided by faction, and without she was assailed by immense hosts of the best disciplined soldiers in Europe, conducted by the most skilful leaders, to whom she had nothing to oppose but an undisciplined multitude, led on by inexperienced chiefs. In this state of things it seemed a safe measure to make war against her. To do so was only to retaliate the conduct she had herself pursued when she effected the dismemberment of the British empire, by assisting our revolted colonies. And the moment seemed to have arrived when, by dismembering France, she might be rendered for ever incapable of becoming dangerous to Britain.

But the most powerful incitements to this war undoubtedly arose from the example of political innovation, which it was so much the interest of every government in which there existed any mixture of hereditary authority, completely to defeat and overwhelm. To comprehend the full force of this motive for going to war, it is necessary to recollect the ferment which universally prevailed in the minds of men, and to imagine the situation and the feelings of a prince, who, though still safe, yet saw in his immediate vicinity the first of European monarchs hurled from his throne to a prison, and from the prison to a scaffold, and his power assumed by subjects who represented their conduct as the triumph of reason and of freedom; while the contagion of their sentiments, extending itself into neighbouring kingdoms, threatened to break out into actions not less violent than those of the revolutionists of France. In such a state of things, and under the influence of such sentiments, a war against France seemed to be a war in defence of the whole arrangements of society; and princes and nobles considered themselves as engaged in the protection, not merely of their power and station, but even of their personal safety.

Still, however, there were not wanting at this time some individuals who thought the war altogether unnecessary for the support of the British constitution and government. The great amount of the national debt, the influence of the crown, and the general happiness and good feeling of the people at large, gave powerful assurances of stability to government and safety to property. Even before the war commenced, the crimes committed by the French revolutionists had greatly diminished the popularity of their cause; and the associations on the side of government

of which were forming throughout the kingdom demonstrated the superiority of its adherents in wealth and numbers. It was therefore thought by many to be perfectly practicable to weather the storm without having recourse to hostilities; and there were even some who doubted the prudence of the war, notwithstanding the strength of the combination formed against France, and suspected, that in a sanguinary and desperate contest, armies conducted by princes, brought into power by the casualty of birth, might prove no match for French enthusiasm in the first instance, and far less ultimately for the superior tactics and enterprise which must speedily be introduced by men rising to command from the admiration produced by their talents and success. Lastly, if Great Britain, instead of assailing, had actively protected the independence of France, this would have secured such an ascendancy over her councils as might have enabled us to protect Holland, and to preserve the life, perhaps even the crown, of Louis XVI.; and, at all events, it would have placed us in a condition speedily to terminate the contest, without any important changes being suffered to take place in the relative strength of the continental states of Europe.

At the close of the year 1792 Mr Pitt did not attend parliament when it first assembled; nor did he make his appearance in the House of Commons till the alien bill was passing through its last stages in January, the discussion ended, and the relative strength of parties ascertained. The ostensible cause of his absence was, that having, on the death of the Earl of Guildford (Lord North), obtained the place of warden of the Cinque Ports, and thereby vacated his seat as a member of the House of Commons, he had gone down to Cambridge to secure his re-election. But the length of his absence suggested to some a suspicion that he was hesitating about engaging to support the court in its design of going to war; and in the mean time Mr Dundas stood forward in the House of Commons as the leading servant of the crown in support of the proposal for engaging in hostilities. On his return, however, Mr Pitt resumed his station in the debates of the house, and supported the measure with the utmost ardour. At this period Lord Thurlow was removed from the office of lord high chancellor, and succeeded by Lord Loughborough, who had originally owed his preferment to the support given by him to Lord North's administration and measures, and who, though hitherto an adherent of opposition, had in the recent debates defended the plans of administration.

On the occasion of a message from the king announcing the declaration of war by France, Mr Pitt stated that his majesty had always declined taking any part in regard to the internal government of France; that during the summer, while France was engaged in war with Austria and Prussia, he had in no way departed from his neutrality; but that as the French seemed now determined to subjugate other nations to their principles, he was under the necessity of interfering for the protection of his allies the Dutch, who had not indeed made any formal requisition for assistance, but to whose government the French had at all times been notoriously hostile. Mr Pitt also represented the language of the men in power in France as intolerably menacing towards the government of Britain, and as pre-eminently dangerous, from its tendency to introduce anarchy. He also adverted in strong terms to the death of the French king as a calamitous event; an outrage to every principle of religion, justice, and humanity; an act which, in this country and in the whole of Europe, had excited but one general sentiment of indignation and abhorrence, and could not fail to produce the same sentiments in every civilized nation. It was, he said, in all its circumstances, so full of grief and horror, that it must be a wish, in which all united, to tear it if possible

from their memories, to expunge it from the page of history, and to remove it for ever from the observation and comments of mankind. All the members who remained in opposition concurred in reprobating the conduct of the French revolutionists. Mr Fox, however, asserted, that the general maxim of policy was, that the crimes committed in one independent state could not be cognizable by another; he alleged that the topics adverted to by Mr Pitt were introduced into the debate to blind the judgment by exciting the passions; and he contended that the opening of the Scheldt, and the decree of the 19th of November, which were stated as the causes of the war, could never justify such a measure. He censured our past neutrality as unfair. While the French were invaded we remained quiet spectators; but on their becoming invaders in their turn, we said Europe was in danger, and interfered against them. He asserted that the real cause, always disavowed by our government, but ever kept in mind, was the internal government of France. The destruction of that government was the avowed object of the combined powers; but, though about to join them, we were ashamed to own that Britain was engaging to aid the restoration of despotism, and therefore the Scheldt and Holland were collusively had recourse to as pretexts. In the House of Lords, when the same subject was discussed, the Marquis of Lansdown contended, that, by sending an able and experienced minister to Paris, our government might have saved the life of Louis XVI. He declared that the war would be wanton on our part, and without provocation on the part of France; and he highly disapproved of the insulting manner in which M. Chauvelin had been dismissed.

At the period of which we are now treating, British commerce had become extremely extensive, and, owing to the commercial treaty, British and French merchants had become closely connected in their transactions. But from the sudden stagnation of trade which the war now produced, added to the alarms which had been excited upon political subjects, a sort of paralysis appeared to seize the country, and the number of bankruptcies exceeded all that had ever happened in the most calamitous times. A general stoppage of commercial credit took place, and no bank would venture to advance money to merchants or manufacturers; the consequence of which was, that many of them, with large quantities of goods in their possession, were unable to make the smallest payment. To apply a remedy to this alarming evil, several of the principal traders and merchants having waited upon Mr Pitt, requested the interference of government; and a select committee of the House of Commons was accordingly appointed to investigate the subject. After consulting with a variety of bankers, manufacturers, and merchants, the committee, on the 29th of April, gave in a report favourable to the solicitation of the merchants for relief; and a bill was introduced on the 1st of May, authorizing government to issue five millions by exchequer bills, in loans to such merchants and manufacturers as should deposit goods in security for the sum advanced. This measure proved extremely salutary. When it was found that the traders could obtain money from government, the bankers and other persons immediately evinced a willingness to advance them funds, or to give credit to their bills; trade gradually revived; and new channels were by degrees found out for the disposal of the productions of British industry.

On the 27th of March, Mr Pitt, in a committee of the House of Commons, stated, that he had borrowed for the service of the year the sum of L.4,500,000. The terms of the loan were, that for every L.72 advanced to the public the lenders should be entitled to L.100 stock, bearing an interest of three per cent., which would make a capital of L.6,210,000, the interest of which, to be paid by the pub-

Reign of George III. lic, would amount to L.186,000 a year. But there was another charge attending the loan; for, by the act for appropriating a surplus million to a sinking fund, it was provided, that whenever a new loan should be made, a fund equal to one per cent. on the whole of it must be provided, and applied to the liquidation of the principal. This, therefore, required an annual charge of L.62,100, and made the whole, including interest, L.248,400 per annum.

On the 15th of March the attorney general brought forward a bill for preventing traitorous correspondence with the king's enemies. The object of this bill was to prohibit the sale to the French government or the French armies, of arms, military stores, provisions, or clothes, under the penalty of high treason. The purchase of lands in France was also prohibited. No one was allowed to go from Britain to France without a license, under the penalty of a misdemeanour; and persons, though subjects of this country, coming from France, were prohibited from entering the kingdom without a passport, or presenting to the master of the vessel a declaration that, in the mean time, they would not quit the place where they had landed without the permission of a justice of peace, or finding security for their good behaviour. Lastly, the insurance of vessels either coming from France or going thither was prohibited. And this bill passed through both houses, supported by great majorities.

During the present session a very great number of petitions were presented to the House of Commons from different parts of the country, praying for a reform in the representation; and on the 6th of May Mr Grey brought forward the question, after presenting a petition which had been framed by the association called the Friends of the People in London. He asserted that the number of petitions now brought forward demonstrated that the House of Commons were not the real representatives of the people, and he gave a detailed statement of the various defects in the representation. The proposal of reform was chiefly resisted on account of the hazard attending it from the example of France, and on account of the extent to which its more ardent partizans out of doors wished it to be carried. Mr Pitt explained his motives for being formerly friendly to a parliamentary reform, and also his objections against it at the present moment. If the principle of individual suffrage, pointed at in several of the petitions, was to be carried to its utmost extent, it would subvert the peerage and depose the king, and, in fine, extinguish every hereditary distinction and privileged order, and establish that system of equalizing anarchy announced in the code of French legislation, and attested in the blood shed in the massacres at Paris. Mr Fox, on the contrary, represented in strong terms the inconsistency of Mr Pitt's present conduct with his former professions. As to the time of attempting a reform, he said, it had been proposed at all periods, in war and in peace; but they had all been represented as improper. The present was not a more dangerous period than the year 1782, when Mr Pitt himself had brought forward a similar proposal. These dangers he ascribed to the councils, generally unwise, and often wicked, by which the country had recently been governed. Mr Grey's motion was rejected upon a division by a majority of two hundred and eighty-two against forty-one.

During the present session several popular measures were adopted. On the recommendation of Sir John Sinclair, L.3000 per annum was voted by the House of Commons for the establishment of a board of agriculture; an institution which has been the means of collecting and conveying to the public much useful information respecting the most valuable of all arts. On a motion by the lord advocate of Scotland, Mr Robert Dundas, a bill was

brought into parliament in the month of April for the relief of the Roman Catholics of Scotland. The persons of that proscribed sect were still incapacitated by law from holding or transmitting landed property, and were liable to other severe restrictions; but these were removed by a bill which now passed without opposition. The passing of this bill was a popular measure, although a dozen years had scarcely elapsed since the people of Scotland had almost universally, and with the utmost violence, combined to oppose any relaxation of the penal laws affecting the Catholics. By the assistance of Mr Dundas, the inhabitants of the north of Scotland also obtained a repeal of the duty on coals carried coastwise, as far as respected that part of Great Britain; but the cities of London and Westminster were less fortunate in an attempt to procure a repeal of the taxes paid by them on the same article.

At this period the exclusive charter of the East India Company being within a year of its expiration, that body presented a petition for a renewal of it; and on the 23d of April the subject was considered in the House of Commons. Mr Dundas observed that the proposal which he was about to make of a renewal of the charter was undoubtedly attended with difficulties. No writer upon political economy had as yet supposed that an extensive empire could be administered by a commercial association; and no writer on commerce had thought that trade ought to be shackled with exclusive privileges. In deviating from these principles, which had been admitted and admired, he was sensible that his opinions had popular prejudices against them; but he was supported by successful experience; and when the house adverted to the peculiarities of the subject before them, they would at once see that he was not attempting to overturn theories, though he was unwilling to recede from old and established practice. It would be idle, and a proof of ignorance, to maintain that all the advantages which Great Britain possessed from its connection with India arose out of the present exclusive privilege of the Company; but it would be impossible to say what might be the political or commercial effects of a deviation from the present system. He then stated, that the shipping employed by the East India Company amounted to eighty-one thousand tons; that the seamen navigating those ships were about seven thousand men, who had constant employment; that the raw materials imported from India for the use of home manufactures amounted annually to about L.700,000; that the annual exports of British produce and manufacture to India and China in the Company's ships amounted to upwards of a million and a half sterling; and that great difficulties would attend any alteration of the present system of government in India, especially from the effects which the innovation might produce on the minds of the natives. He therefore proposed a variety of resolutions, the most material of which was, that it appeared fit and proper to continue to the East India Company their exclusive trade, within the limits now enjoyed by them, for a further term of twenty years, to be computed from the 1st of March 1794, but liable to be discontinued at the end of such a period, if three years' notice should previously be given by parliament. The resolutions proposed by Mr Dundas having been carried, a bill for renewing the East India Company's charter was brought in, and passed through both houses with little opposition. The trial of Mr Hastings still proceeded, though very slowly. It was now totally disregarded by the public.

During this year government sought to strengthen itself by erecting barracks in the vicinity of the great towns, in order that, by residing apart from the citizens, the soldiers might be removed beyond the contagion of popular opinions. But a considerable degree of political fermentation still prevailed in the minds of the people. In Eng-

Reign of George III. land, a bookseller was prosecuted, and punished with imprisonment, for selling the second part of Paine's *Rights of Man*; and one or two individuals of humble rank were committed for seditious publications. In Scotland the public attention was much excited by the prosecution of two gentlemen, Mr Thomas Muir of Hunter's Hill, a member of the faculty of advocates; and Mr Fysche Palmer, a member of the university of Cambridge, who officiated as unitarian minister at Dundee. Mr Muir had been extremely active during the autumn of the preceding year, when the political agitation was at its height, in promoting associations in Glasgow and its neighbourhood, for the purpose of procuring a reform of the representation in the House of Commons. In point of talents he was not above mediocrity, but he possessed the faculty of unpremeditated elocution in a surprising degree, and appeared to be actuated by the vanity of haranguing without end, which the daily meetings of these societies afforded him an opportunity of gratifying. In other respects he was not formidable, possessing little knowledge of the world, and still less discernment of the human character. He injured the cause which he meant to promote, by collecting assemblages of people, first at Glasgow, and afterwards at Edinburgh, and thus creating an appearance of disorder and turbulence, which alarmed the government, and intimidated persons who were otherwise disposed to favour the political sentiments which he professed. Mr Palmer was a man of eminent literary talents, and attended political societies, but without making any remarkable efforts to distinguish himself in these assemblages. He was tried before the circuit court of justiciary at Perth, on the 17th of September, some months after Mr Muir's conviction at Edinburgh, and found guilty of publishing a political libel, which had been written by some other person, but which he had corrected and ordered to be printed. Both of these gentlemen were sentenced to transportation, Mr Muir for fourteen, and Mr Palmer for seven years; and they were accordingly shipped off, among common felons, for Botany Bay. The disproportionate severity of these sentences excited general sympathy, and produced considerable discussion. The crime of which they were convicted was that of sedition or leasing-making, which by the law of Scotland is punishable by fine, imprisonment, or banishment; but as it is a rule in law, that penal statutes are to be strictly interpreted, it was doubted how far the punishment of transportation could be inflicted under a statute which points out, in general terms, banishment as the punishment of the offence. Not intimidated by these trials, a few persons of no public or political importance whatever met at Edinburgh in the month of November, and thought fit to call themselves a British Convention. They mimicked the proceedings of the French national convention as closely as possible, saluting each other with the title of citizen, holding public sittings, admitting strangers to the honours of the sittings, and mingling the solemn with the ludicrous in a singular style. At any other period their conduct would have excited nothing but ridicule; at this time it was considered in another light, for some of the members were brought to trial, and punished with the same severity which had been exercised towards Messrs Muir and Palmer.

To promote the success of the war, a convention had been concluded in the spring between our court and that of Petersburg, stipulating for the prosecution of hostilities till the French relinquished all their conquests. A treaty was soon afterwards entered into with the landgrave of Hesse Cassel, for a subsidiary body of eight thousand men, which, by a subsequent agreement, was extended to twelve thousand; and the king of Sardinia engaged, for £200,000 per annum, to keep up an army of fifty thousand men, to be employed in the particular defence of his dominions, and

in general service against the enemy. Compacts of alliance were also adjusted with Spain, Naples, Prussia, Austria, and Portugal; and besides the stipulation of vigorous hostility, it was agreed that the conduct of other powers should be watched with extraordinary circumspection, lest they should abuse their professed neutrality by protecting the commerce or property of the French.

The detail of the military transactions of this eventful contest will be given under another head. But we may observe here, that during the present campaign the independence of France seemed at one time to be in considerable hazard. The faction which had overturned the monarchy, assembled a convention of national representatives, and endeavoured to establish a republican form of government, soon divided itself into two parties, those of the Gironde and the Mountain. The leading party, when the republic was first proclaimed, consisted chiefly of men of letters, who were led by speculative considerations to expect a wonderful amelioration of the human character, and of the state of society, from the changes they were producing. They wished to avoid sanguinary measures at home, and to restore tranquillity to their country as speedily as possible; but being equally deficient in energy and in knowledge of the character of their countrymen, they were successfully opposed by a turbulent and ferocious minority, led by Robespierre, Danton, and other men of the most unprincipled and sanguinary temper. The moderate and ruling party were also deceived by many of those whom they had employed; and at last their favourite commander, Dumouriez, having been repulsed in the Netherlands by the united forces of Austria, Prussia, and England, entered into a negotiation with these powers for the restoration of monarchy in France. But the treacherous project was rendered abortive by the fidelity of his army, which almost to a man deserted their general, and refused to bring the independence of their country into hazard by allowing foreign armies to interfere in the arrangement of its internal government. The defection of Dumouriez, together with the repulse of their armies, brought the moderate party, which still ruled in the French convention, into great difficulties; and it is an unfortunate circumstance that the British government did not then seize the opportunity of making peace with them. The hazard of innovation was now past. One of the maxims of the first French republicans was the love of peace and hatred of war; and the unsuccessful issue of the attempt made to penetrate into other countries must have added force to this sentiment. The tranquillity of Europe might thus have been insured; a mild party would have been preserved in power; Great Britain might have obtained an influence over their councils; and the sanguinary scenes which afterwards occurred in the interior of France, and upon the frontiers, might have been prevented. But this opportunity was unhappily disregarded; and from the distraction within, and the immense combination of force assailing France from without, the complete subjugation of that country was confidently anticipated. Meanwhile the failure of the military operations of the Girondists encouraged the wild party to attempt the overthrow of the more moderate French republicans, by exciting an insurrection of the populace in Paris; an attempt which unhappily proved but too successful. The national representatives were subdued, ninety members of the convention were imprisoned, and the minority were enabled to convert themselves into an apparent majority. By this event all France was thrown into confusion. The authority of the convention, thus impaired, was utterly rejected by the south of France; and the town and harbour of Toulon, with its fleet and stores, were surrendered by negotiation to the British admiral, Lord Hood, as trustee for the next heir of the monarchy. In the western parts of

Reign of George III.

Reign of
George III.

France the standard of royalty was reared, and joined by immense multitudes, who adhered to it with the most obstinate bravery, and were not subdued till after a greater expenditure of blood than was found necessary for the repulse of the combined armies of Europe.

On the part of Britain the general plan of the war does not seem to have been well contrived or properly carried into effect. A great part of the western coast of France was in full possession of the royalists, whilst the British navy at the same time commanded the ocean. It would therefore have been comparatively an easy enterprise to land an army on the French coast for the assistance of the royalists, and to advance through an open country, destitute of fortified towns, to the capital, and against a convention whose authority was scarcely acknowledged by a third part of the nation. Instead of this, the combined armies were directed against the French Netherlands, where they wasted the summer, as well as their own strength, in the siege of a few of the fortresses which defend that frontier; and thus the attack upon France was made upon its strongest side, at a distance from the centre of its power, and where the means of protracted resistance were the greatest; whilst leisure was afforded to the convention to establish its authority, to call out immense levies for the defence of the country, and before the close of the year to turn the tide of success in its favour. Toulon was retaken under the masterly direction of Bonaparte, who then first appeared on the revolutionary stage; and the Spaniards were beaten in the south; whilst, on the northern frontier, the British army was repulsed before Dunkirk, and the commander in chief of the allies, the prince of Cobourg, before Maubeuge. The Duke of Brunswick and General Wurmser were also driven across the Upper Rhine near Mentz, in the last two weeks of the year, after a succession of sanguinary conflicts, in which the French, by daily bringing forward fresh troops, at last succeeded with their raw levies in wearing down the strength and the courage of their veteran enemies.

The British parliament assembled on the first of January 1794. In the speech from the throne his majesty called the attention of the two houses to the issue of the war, "on which depended the support of our constitution, laws, and religion, and the security of all civil society;" to the advantages which had attended our arms both by sea and land; and to the expectation of ultimate success, founded on the circumstance that the efforts of the enemy, proceeding on an arbitrary system, which enabled them unjustly to dispose of the lives and properties of the people, must eventually introduce internal discontent and confusion. His majesty further stated the impossibility of making peace consistently with the permanent safety of the country, and the tranquillity of other nations; he noticed the treaties and conventions into which he had entered with foreign powers; and he mentioned the general loyalty which prevailed amongst all ranks, notwithstanding continued efforts to mislead and seduce the people.

As usual, the topics introduced into the king's speech became the subject of debate, both in the House of Lords and in the House of Commons; but they excited little attention throughout the nation. Men of property were generally so much alarmed by the events which had occurred in France, that they reposed implicit confidence in the government; and as administration seemed resolved not to despair of success, they derived great support from the approbation of the public. A minority, indeed, existed throughout the country, by whom the war was openly disapproved of; but as they consisted in general of persons of little influence, they were unable seriously to embarrass the measures of administration. When the king's speech was taken into consideration, Lord Wycombe moved an amendment to the address, recommending pacific

measures. But Lord Mornington, on the other hand, contended that the alternative of war or peace did not at present exist. Before we could relinquish the principles on which the war had commenced, proof was necessary either that the opinions which we had conceived of the views of France were erroneous, that the war had become desperate and impracticable, or that, from some improvement in the system and principles of the French, the necessity which had prompted us to commence the war no longer existed. Nothing of this sort had occurred. France entertained unlimited views of aggrandizement and ambition, connected with principles subversive of all regular government. Mr Sheridan entirely dissented from these views, and affirmed that Britain had acted with as little regard to the independence of neutral states as the French; that she had endeavoured to compel Genoa, Switzerland, and Tuscany, to join the confederacy against France, by the most insulting menaces; and that, as far as prudence would permit, she had assumed the same language towards Sweden and Denmark. If the French system of fraternization with other nations who wished to overturn their own internal government formed a just cause of war, their dereliction of that system ought to be a reason for making peace. He denied that the French were the original aggressors. I am astonished, said he, that the minister who sits near the Noble Lord does not himself feel it necessary to his own dignity to oppose this paltry argument of the act of aggression having come from them, instead of leaving that task to us, to whom comparatively the fact is indifferent. When he hears this called a war of necessity and defence, I wonder he does not feel ashamed of the meanness which it spreads over the whole of his cause, and the contradiction which it throws among the greater part of his arguments. Will he meet the matter fairly? Will he answer this one question distinctly? If France had abstained from any act of aggression against Great Britain and her ally Holland, should we have remained inactive spectators of the last campaign, idle, apart, and listening to the fray, and left the contest to Austria and Prussia, and whatever allies they could themselves have obtained? Does he then mean to say that he would have sat still; that Great Britain would have sat still with arms folded, and, reclining with luxurious ease on her commercial couch, have remained an unconcerned spectator of this mighty conflict, and have left the cause of civil order, government, morality, and religion, and its God, to take care of itself, or to owe its preservation to the mercenary exertions of German and Hungarian barbarians; provided only that France had not implicated Great Britain by a special offence, and forced us into this cause of divine and universal interest by the petty motive of a personal provocation? Mr Sheridan admitted that enormities had been committed in France, which disgusted and sickened the soul. This was most true; but what relation had these to England? And if they had, what did it prove? What, but the eternal and unalterable truth, that a long-established despotism had so far degraded and debased human nature, as to render its subjects, on the first recovery of their rights, unfit for the exercise of them? That we and all the powers of Europe had reason to dread the madness of the French, he agreed; but was this difficulty not to be accounted for? Wild and unsettled as they must necessarily be from the possession of such power, the surrounding states had goaded them into a paroxysm of madness, fury, and desperation. We called them monsters, and hunted them as monsters. The conspiracy of Pilnitz, and the brutal threats of the abettors of that plot, had to answer for all the additional horrors that had since disgraced humanity. We had covenanted for their extermination, and now complained that they turned upon

Reign of
George III.

Reign of us with the fury which we had inspired. No reasonable
George III. hope of success existed upon which we ought to proceed.
What was the state of our allies when we entered into the confederacy? The force of Austria unbroken, though compelled to abandon Brabant, and the power of the veteran troops of Prussia absolutely untried, though the seasons and disease had induced them to retire from Champagne. What was their state now? Defeat had thinned their ranks, and disgrace had broken their spirit. They had been driven across the Rhine by French recruits, like sheep before a lion's whelp, and that not after the mishap of a single great action lost, but after a succession of bloody contests of unprecedented fury and obstinacy. Where now was the scientific confidence with which we were taught to regard the efforts of discipline and experience, when opposed to an untrained multitude and unpractised generals? The jargon of professional pedantry was mute, and the plain sense of man was left to its own course. Mr Windham combated the opinion, that the enormities committed in France were the effects of the war. Mr Dundas defended the management of the war, and the activity which had been employed by government in conducting it. Our seamen in the beginning of the year were only fifteen thousand; in the course of the war fifty-four thousand men had been added. At the commencement of the war we had only thirteen ships of the line and thirty frigates fit for service; at the present time we had eighty ships of the line and a hundred frigates in actual employment, which, with the armed vessels now in the service of the public, made the whole above three hundred sail. In augmenting the army, the most effectual and economical system had been pursued; besides the militia, thirty thousand men had been added to the army. Mr Fox repeated that we were the aggressors in the war; contended that every state had a full right to regulate its internal government; and asserted, that the manifesto of the Duke of Brunswick had occasioned all the excesses of the French. He denied that the prodigal manner in which the French government conducted their affairs, and the confusion and ruin into which their finances were hastening, afforded any prospect of success to the allied powers. He remembered, that during the American war there was much talk of a vagrant congress, which was nowhere to be found, of their miserable resources, and their wretched paper money at three hundred per cent. discount, of which, with any few halfpence you had in your pocket, you might purchase to the amount of a hundred dollars. The Americans were represented as exercising on each other the most intolerable tyranny, on the royalists the most unheard-of cruelty; and it was then said, that if such principles were suffered to exist, if the cause of America were ultimately successful, there was an end of all civilised government, and England must be trodden in the dust. Yet then, said this statesman, I recommended negotiation, and lived to see Great Britain treat with that very congress so often vilified and abused, and the monarchy remain in sufficient vigour. Mr Pitt recapitulated the arguments formerly employed to prove that the aggression had certainly taken place on the part of France. The system adopted by the French, their usurpation of foreign territory, their hostile intentions against Holland, and their unprecedented views of aggrandisement and ambition, were subversive of all regular government; and unless it could be proved that we had mistaken these principles, we were bound to continue the war, even supposing that difficulty and disappointment had occurred in the prosecution of it. He conceived there was not the least probability of the continuance of the present government of France. The efforts of the people had been merely the result of terror, and were supported by desperate resources, which could not possibly continue.

He admitted that a safe and advantageous peace ought to be concluded, as soon as it could possibly be obtained; but the security and benefits of peace with France must depend upon the establishment of a government essentially different from the present. After a lengthened discussion, the address was carried by an overwhelming majority. In the House of Lords a similar debate took place, and similar arguments and views were respectively urged by the adverse parties; but ultimately the address was carried by a majority as decisive as that in the Commons.

It is one of the characteristics of the British nation, to be at all times easily thrown into a state of anxiety and alarm, by any object which government for the time thinks fit to represent as dangerous. The two greatest objects of political terror to Englishmen have at all times been the fear of a foreign invasion, and the dread of secret conspiracies by a disaffected party. During many ages Britain has not been successfully invaded; and, since the time of the Spanish Armada, no such attempt has been made by any of those governments with which Britain has engaged in hostility; but this circumstance, which leads reflecting persons to regard such a project as extremely unlikely to occur, seems to produce a contrary effect upon the people at large. The evils attending invasion having never been felt, lay hold of their imaginations, in the wildest and most exaggerated forms; and from the terror thus produced, they are prevented from reflecting upon the difficulties attending the project, which deterred Louis XIV. from attempting it while in the height of his power, and with the advantage of a disputed succession to the crown. Yet such is the credulity of the British nation upon this head, that administration can at any time throw them into a state of the utmost consternation, by expressing an apprehension of a French invasion; and from this apprehension ministers usually derive very considerable advantages. The voice of faction is for a time silenced by patriotic terror, and all parties hasten to arrange themselves under the banners of government for the defence of their country. The dread of plots and conspiracies produces effects somewhat similar. It is true that no conspiracy of Englishmen was ever productive of danger to the government whilst it remained even tolerably popular; but this never prevents the nation from being thrown into consternation, by intimations, on the part of government, that some desperate conspiracy is secretly carrying on, and ready to burst forth, to the utter destruction of the public tranquillity.

During the war of which we are now treating, Mr Pitt's administration derived incredible strength from these two sources of terror; the fear of invasion, and the dread of conspiracies by disaffected persons. Nor did he want skill to profit by them. At the commencement of the war it had been believed by most persons, and perhaps by government, that it would be of short duration, the state of anarchy which succeeded the overthrow of the monarchy in France seeming to render that country an easy prey to the powerful armies by which it was invaded; and when any doubt of success was expressed, it was answered, that after making trial of the war for a year, we might desist in case we were unsuccessful. But although the original state of affairs had been considerably altered by the successes of the French, yet the British government still resolved to persist in the war, which, however, was now daily becoming less popular. On the other hand, the French leaders were greatly irritated by the persevering hostility of the British ministry, and in the pride of victory menaced England with invasion. It is evident that they had still too much business upon their hands on the Continent to be able to make the slightest attempt to carry their threats into execution; but the British administration, taking advantage

Reign of
George III.

of the threat, expressed their fears that it might be successful; and proposed the arming of associations of volunteers, both cavalry and infantry, throughout the island, for the defence of the nation against foreign invasion, and the efforts of disaffected persons at home. They also encouraged the raising of subscriptions to defray the expense of these armed associations; and although the measure was disapproved by the minority in parliament, as an unconstitutional mode of raising money, it was supported by the majority. An act was passed authorizing the embodying and training of volunteers, and the measure was carried to a considerable extent throughout the country. In like manner, though the political ferment occasioned by the French revolution had now considerably subsided, administration, aware of the strength derived from keeping the country in a state of anxiety upon political subjects, announced to parliament, by a royal message, that seditious practices had been carried on by certain societies in London, with a view to overturn the constitution, and introduce the system of anarchy which prevailed in France; and that their papers had been seized, and were submitted to the consideration of the house. On the same day Thomas Hardie, a shoemaker in Piccadilly, who had acted as secretary to the London Corresponding Society, and Daniel Adams, the secretary to the Society for Constitutional Information, were apprehended for treasonable practices, upon a warrant from Mr Dundas. Mr Horne Tooke, well known for his ingenious philological writings, as well as for the political part he had formerly acted in the turbulent days of Wilkes, the Reverend Mr Jeremiah Joyce, Mr Holcroft a dramatic writer, Mr Kyd a barrister, and Mr John Thelwall, who had for some time entertained the town in the character of political lecturer, were also in a few days arrested and committed to the Tower on a charge of high treason.

For the sake of giving solemnity to the inquiries made into this conspiracy, a secret committee of the House of Commons was chosen by ballot, the members of which were the friends of the minister. The report of the committee concerning the alleged conspiracy amounted to little more than a recital of a number of advertisements from societies, or accounts of their debates, which had previously been inserted in the public newspapers; but it served as a pretext for suspending the Habeas Corpus act, and thereby enabling ministers to prevent any political movement, or avowed disapprobation of their measures, from being rashly exhibited out of parliament. In the meanwhile the dread of invasion, added to the political alarm which had previously diffused itself throughout the country, and which was thus artfully maintained, conferred upon ministers a degree of strength which, for a century and more, no British administration had possessed. Almost all men of property were their adherents; whilst their antagonists sunk into utter discredit, and suffered a species of persecution in every department of society; so that it became dangerous to a man's prospects in the world, and in ordinary business, to express the slightest doubt of the propriety of any measure approved by government.

In the early part of his administration, Mr Pitt had endeavoured to rest his reputation, in a considerable degree, upon the improvement of the finances, and the hope which he held out of paying off the national debt. He now deserted all such views; and taking advantage of the uncontrolled power he possessed at home, and the pliability of parliament, he engaged in a career of unexampled expenditure, in corrupting successive parties in France, or in the management of the war.

From its first rise to eminence as a European power, Prussia considered France as its protector against the ambition of Austria. During the present year, notwithstand-

ing the resistance of a party in Poland, headed by the brave Kosciusko, that country was partitioned, and Prussia obtained an ample share of its territory. But the partition of France was an object from which Prussia had every thing to fear, as it would destroy the only power by which Austria, the inveterate enemy of Prussia, had at all times been kept in awe. When the Prussian monarch found it necessary, in conjunction with his allies, to invade France in 1792, he retired upon the first appearance of a tolerably firm opposition, and gave the republic a respite of another winter, during which to arrange its strength, and call into action its resources. In the year 1793 the Prussians remained extremely inactive till towards the close of the campaign, when at last, in consequence of repeated remonstrances from their allies, they advanced against Alsace; but being there repulsed, and the republic beginning to exhibit on all sides a firm military front, the king of Prussia declared that the expenses of the war were more than his finances could sustain, and required the other German states to supply him with money, threatening in case of refusal to abandon the common cause; and on their declining to comply with his demands, he actually began to withdraw his troops. But by this time the British ministry had engaged in the war with a degree of eagerness which induced them to make every sacrifice to obtain success; and therefore, to avoid losing the assistance of Prussia, they offered a subsidy, which was finally adjusted, upon the condition that his Prussian majesty was to furnish sixty-two thousand troops, or thirty thousand beyond his contingent; for which his Britannic majesty was to pay him L.50,000 a month, L.100,000 a month for forage, L.400,000 to put the army in motion, and L.100,000 on their return, or in all, for the remaining nine months of the year, L.1,350,000. At this rate the expense of the whole year would amount to L.1,800,000, of which the states general were to pay L.400,000; and the forces thus subsidized were to be commanded by an officer to be named by the king of Prussia. By this treaty the king of Prussia was enabled to keep his army upon the war establishment with little additional expense to himself, and with the power of claiming a share of whatever conquests were made from France; whilst, by retaining the appointment of the general of the subsidized army, he preserved a complete command over it, and might prevent his troops from being worn out by active service, or restrain them from doing greater injury to the French republic than he should judge prudent or expedient in the circumstances.

All Europe looked forward with great anxiety to the approaching campaign as decisive of the contest; in which its whole powers, excepting Russia, Sweden, and Denmark, were actively engaged. At sea, where her strength could be most effectually exerted, Great Britain was eminently successful. An expedition under Sir Charles Grey and Sir John Jervis was sent to the West Indies, where Martinique, St Lucie, and other islands, were taken. In the Mediterranean the French were driven from the island of Corsica, and the inhabitants acknowledged the king of Great Britain as their sovereign. But the most signal victory was that gained by Lord Howe over the French fleet on the first of June near Brest. During the first years of the revolution France had suffered much distress from a scarcity of grain; and such was the inveteracy with which the present war was conducted, that the British government had formed a plan of subduing that nation by famine, by preventing their obtaining supplies of provisions from any foreign country. In their distress the French rulers had applied for assistance to the United States of America, which still owed a considerable debt to France, contracted during the war by which their own re-

Reign of
George III.

Reign of George III. volution had been accomplished; and they now offered to accept payment of this debt in corn, a commodity abounding in America. The Americans, accordingly, delivered the grain in their own ports, and a hundred and sixty sail of vessels laden with grain set out for France. As soon as this became known, Lord Howe was dispatched, in order, if possible, to intercept this valuable convoy; while the French admiral, Villaret-Joyeuse, sailed from Brest to hazard an engagement with the British fleet, for the sake of preserving the convoy. The force of the hostile fleets was nearly equal, the British having twenty-six, and the French twenty-five sail of the line; but the French line was broken, and, after an obstinate engagement, six of their ships were taken, and two sunk. Before the battle, however, the French admiral had detached a considerable force for the protection of the convoy, which was thus enabled with safety to reach its destined port. This victory produced very great exultation in Britain; and the fear of invasion which had been previously excited was abated by so decided a proof of naval superiority.

On the part of the French, however, these colonial and naval losses were greatly overbalanced by the general result of the campaign. The allies still concentrated their principal force against the Netherlands, and with that view, at the commencement of the campaign besieged and took Landrecies; but the fortune of the war was speedily changed. General Pichegru advanced into maritime Flanders, and in a variety of engagements defeated Count Clairfayt, an Austrian general of great activity, who ruined his army by incessant and sanguinary efforts to drive back a superior enemy. An attempt made by the grand army to cut off the retreat of Pichegru proved unsuccessful; and the latter having in turn manœuvred to intercept the communication of the imperialists with their magazines at Ghent, was in like manner repulsed; but the obstinate conflict which he maintained, and the steady fire of his troops, during a succession of conflicts, which lasted from daybreak till sunset, convinced the allied armies that the invasion of France had become a hopeless project. At last the French advanced, under General Jourdan, from the eastward, and at Fleurus gained a victory which cost the Austrians nearly fifteen thousand of their best troops. Mutual disgust, as well as discouragement, now prevailed among the allies. The Austrians retreated, leaving the Duke of York at the head of the British and Hanoverian forces in considerable peril; but, with the assistance of the Earl of Moira, his royal highness made good his retreat. This nobleman, who had distinguished himself in the American war, was opposed to the present war, which he had reprobated in his place in parliament. But having nevertheless been sent by administration with a feeble armament to assist the royalists on the western coast of France, and finding himself too weak to effect any thing of importance in that quarter, he had brought back his troops; and was afterwards sent with them to defend Ostend, where, learning the difficult nature of the Duke of York's situation, and perceiving that Ostend could not long be protected after the rest of Flanders had been deserted, he marched across the country, and in the face of much danger, and under great hardships, effected a junction with the principal British army, to which this reinforcement afforded seasonable aid.

The French were no less successful on the Upper Rhine, and on the frontiers of Italy and of Spain. At the end of the campaign, an intense frost having set in, they reinforced their armies, and Pichegru invaded Holland. After a variety of engagements the British and Hanoverians, together with some Austrian auxiliaries, whom Britain had subsidized, were repulsed, and found it necessary to abandon Holland to its fate. Many Dutch families sought

refuge in Britain. When Utrecht had submitted to the enemy, the stadtholder, knowing that Amsterdam would not be defended, left his country, and escaped in a fishing-boat to England, where he and his family became immediate objects of royal liberality, and were treated with the respect due to their rank and misfortunes. The Dutch, who had viewed the English with a very unfriendly eye since the revolution of 1787, appeared to be highly pleased with this change in their affairs. They had treated our soldiers with great illiberality, and refused to alleviate by kindness or compassion the sufferings of the wounded, or the distress of the fugitives, who at length effected their retreat to Bremen, after a long and severe trial of their patience and fortitude. The United Provinces were now revolutionized on the French model. Liberty, equality, and the rights of man, were proclaimed; representatives of the people were chosen; and the regenerated state was named the Batavian Republic. But the pretended friends of the Hollanders, in rescuing them from what they termed a disgraceful yoke, did not suffer them to enjoy real freedom or independence.

The result of these successes was, that the king of Prussia perceiving France restored to more than her ancient energy, and capable of humbling his enemy and her ancient rival, the house of Austria, deserted the coalition, refused to accept of any further subsidy from Britain, and took under his protection, as neutral states, the whole princes of the north-west of Germany; thus becoming the ostensible head and guardian of a large division of the empire, which was enabled to recover its tranquillity, and to become a calm spectator of the prolonged contest, which the rest of the empire under Austria continued to carry on against France. Spain was also under the necessity of imitating the example of Prussia, though upon less favourable terms, being constrained to relinquish, as the price of peace, her half of the island of St Domingo; and the Duke of Tuscany also deserted a contest in which he had reluctantly engaged.

In the meanwhile administration pursued their system of alarming the friends of internal tranquillity, by the dread of conspiracies and attempts against the constitution. The persons who in the month of May had been imprisoned on a charge of high treason were brought to trial in the end of October. The first was Thomas Hardie. His indictment stated nine overt acts of high treason; first, forming an intention of exciting rebellion and insurrection, and conspiring to subvert the government and depose the king; secondly, writing various books, pamphlets, letters, and addresses, recommending delegates to a convention; thirdly, consulting as to the means of forming such a convention; fourthly, agreeing to form themselves into a society for the purposes aforesaid; fifthly, causing arms to be made in order to subvert the government and depose the king; sixthly, conspiring to levy war within the realm; seventhly, conspiring to aid the king's enemies; eighthly, composing and publishing certain books, pamphlets, letters, exhortations, and addresses, for the purposes aforesaid; and, lastly, procuring arms for the purpose of levying war against the king, and exciting rebellion and insurrection. The written evidence consisted chiefly of advertisements and addresses, published in the newspapers, many of which were expressed in a very intemperate style; and of the proceedings of the societies, which were all public. With regard to the alleged charge about arming the people, it appears to rest upon no solid foundation; and the accusation and defence, therefore, turned chiefly upon the question of treasonable intention upon the part of the accused and his associates. Hardie was ably defended by the Honourable Thomas Erskine and Mr Vicary Gibbs, and the prosecution was conducted

Reign of George III.

Reign of
George III.

by the attorney and solicitor general; but after the proceedings had been protracted to the eighth day, the jury, after some deliberation, brought in a verdict of not guilty. The next trial was that of Mr Horne Tooke, who endeavoured to prove that he had merely followed the example of Mr Pitt, in recommending a plan of parliamentary reform. The minister was examined on the occasion, chiefly regarding the proceedings of the popular party, before the close of the American war, with a view to establish this point; but he evaded most of the questions by alleging a want of recollection. The acquittal of Mr Tooke was followed by that of Mr Thelwall; and a despair of convicting any one of the supposed traitors led to the abandonment of the other indictments.

As the war was becoming unpopular, the acquittal of these persons, which tended to discredit the alarms kept up by the friends of administration, was felt by them as an additional misfortune. Had the indictments been laid for sedition only, the prosecutions would probably have proved successful; but ministers were led to carry matters the length of an accusation of treason, by their success in a similar charge at Edinburgh in the preceding month of September, against two persons named Robert Watt and David Downie. Watt had been a spy, employed by government to attend political societies, and discover the designs of the leaders; but as he was a needy person, and had been unable to communicate intelligence of much importance, he had received little pay. To earn more money, he thought fit to contrive a plot, which he communicated to Downie and some others, for seizing the castle and the public offices at Edinburgh, with a view no doubt of afterwards holding out his associates to government as criminals. Neither he nor they had any means of carrying such a plan into effect. But Watt having procured some pikes, deposited them in a cellar in his own house, where they were accidentally discovered; the spy was apprehended; and the persons to whom he had communicated his plan having come forward as witnesses against him and Downie, they were both found guilty of high treason. Downie, who had done little more than appear to approve of Watt's plan, was recommended to mercy, and afterwards pardoned; but Watt was executed.

Another source of encouragement to proceed with measures of severity arose at this time out of a plot brought to light by some informers, and by way of ridicule termed the Pop-gun Plot. The persons implicated in this charge were, John Peter Le Maitre, a native of Jersey, and apprentice to a watch-case-maker in Denmark Street, St Giles; William Higgins, apprentice to a chemist in Fleetmarket; and a man of the name of Smith, who kept a book stall in the neighbourhood of Lincoln's-inn. Their accuser was one Upton, an apprentice or journeyman to a watchmaker. Le Maitre, Higgins, and Smith, were apprehended on Saturday the 27th of September, by a warrant from the Duke of Portland, as secretary of state, and examined on Sunday the 28th, before the privy-council, the lords of which were summoned again to attend on Tuesday upon the same important business. The charge, supported by the testimony of Upton, bore in substance, that an instrument was to have been constructed by the informer Upton, in the form of a walking stick, in which was to have been inserted a brass tube of two feet long; that through this tube a poisoned dart or arrow was to have been blown by the breath of the conspirator Le Maitre at his majesty, either on the terrace at Windsor, or in the playhouse; and that the poison was to have been of so subtle a nature, that if the point but glanced upon the king, it would produce instantaneous death. Nothing short of the most consummate ignorance of the state of human science could, on any ordinary occasion, have procured a moment's at-

tention to so ridiculous a story as this; but such is the well-known credulity of the English nation regarding political dangers, that administration and their friends appear to have regarded this plot as an affair of some importance.

Parliament assembled on the 30th of December. In the speech from the throne his majesty urged the necessity of persisting in the war, however unfortunate it had been; and noticed the rapid decay of the resources of the enemy. The Dutch had, he observed, from a sense of present difficulties, entered into a negotiation for peace with the prevailing party in France; but no established government could derive security from such a negotiation. The most effectual means had therefore been employed for the further augmentation of the forces, on whose valour, as well as on the public spirit of the people, he placed the utmost reliance. This speech also mentioned the accession of the sovereignty of Corsica to the British dominions; a treaty of amity and commerce with America; and the conclusion of a treaty of marriage between the Prince of Wales and the Princess Caroline of Brunswick.

When an address to his majesty in similar terms with the speech was moved in common form, very animated debates took place in both houses of parliament. The war was attacked and defended upon the usual grounds, with this additional circumstance, that the events of the late campaign gave considerable countenance to the assertions of opposition, that all hope of ultimate success was irrational. Administration, however, were no less powerful than formerly. On the last day of the preceding session they had received into official situations some of those supporters of the war who in former years had opposed their measures. Earl Fitzwilliam had been appointed president of the council; the Duke of Portland became one of the secretaries of state; Earl Spencer was declared keeper of the privy seal; and Mr Windham was appointed secretary at war. But notwithstanding these official changes, Mr Pitt, with the aid of his friend Mr Dundas, and his relation Lord Grenville, was understood to retain the efficient power of the state. Mr Dundas still retained the management of the war with France; and, as a kind of third secretary of state, he performed a considerable part of the business which would otherwise have devolved upon the Duke of Portland; while at the same time he continued, as president of the board of control, to superintend the affairs of India, and to hold the office of treasurer of the navy. Earl Fitzwilliam was soon got quit of, being sent to Ireland as lord-lieutenant, under an agreement that he was to have full power to promote the repeal of the penal statutes against the Catholics, and to concede certain privileges which had been withheld in 1793. But ministers having altered their sentiments about some of these points, prohibited him from proceeding; and as he insisted upon the terms on which he had accepted his situation, he was recalled and dismissed from office. By joining ministers for a time, he was prevented from acting along with opposition in reprobating the war, and thus he was left insulated and separated from both parties.

Among the debates of the present session, one of the most remarkable was that which occurred upon the motion of Mr Grey in the House of Commons on the 26th of January 1795, that the existence of the actual government of France ought not to be considered as precluding a negotiation for peace. After two years of war, which had drained this country of its blood and treasures, we did not appear to be one point nearer the object for which it was undertaken. From certain words of the minister on a former occasion, Mr Grey inferred that this was a war of extermination, a mortal strife, to be carried on till one of the parties should be destroyed. He wished, by the motion, to put the question to issue whether this opinion was

Reign of
George III.

countenanced by the House of Commons. The public at large, and even the enemy with whom we were contending, had a right to know the length to which the contest was to be carried, and the terms upon which peace was to be obtained. He endeavoured to show that there existed no prospect or chance of success in overturning by force of arms the republican government of France, and that a war persisted in with that view must necessarily be absurd; that the people of France were too firmly attached to their new arrangements to be likely to give them up, however they might change their leaders; that a dependence upon a decay of their finances was equally ill founded; and that, both in the American war and in this, the affairs of the British nation were unfortunately intrusted to persons unable to distinguish between the fallacy of imperfect calculations and the energy of a people struggling for independence. Our own resources were, he doubted not, equal to every thing to which they ought to be applied, but not equal to the conquest of France, or to a war of aggression. The exhausted state of the emperor's finances was evinced by a memorial he had recently addressed to the circles of the Upper Rhine. Was it then from him, from the Italian states, the kings of Sardinia, Naples, and Spain, or from our disgraceful alliance with the empress of Russia, that we expected assistance? Or was it from our good German ally, who had taken L.1,200,000 of our money, who had not brought into the field the sixty-two thousand men for which he stipulated, who had denied our right to command any of the Prussian troops, and contended that they ought not to march against the French, but to remain to defend Germany? The strongest reason which a great nation could have for war, was the defence of its honour; and this, he contended, we had so fully vindicated, as to secure us from future insult. The decree of the convention in November 1792 now formed no bar to a negociation, as that declaration had been repealed, and followed by a contrary declaration. As additional reasons, Mr Grey noticed the capture of Holland, and the debates in the diet at Ratisbon, in which all parties agreed for overtures to the enemy, except the elector of Hanover and the landgrave of Hesse. Mr Pitt, in reply, asserted that the motion was utterly inconsistent with the sentiments formerly expressed by his majesty and by parliament, and therefore proposed an amendment, importing that it was the determination of the house to prosecute the war, as the only means of procuring a permanent and secure peace. Mr Pitt contended that no nation at war with another ought to treat for peace with a government which could not give security; that this last was the great object by which alone the war could be terminated; that nothing but a series of revolutions had been generated under the system and principles now prevalent in France; that the agriculture and commerce of France were in the most disastrous situation, and justice almost unknown; that the house would never willingly consent to treat with a nation of atheists; that in April 1793, the French had enacted the penalty of death against any person who should propose peace with any country which did not acknowledge the French republic one and indivisible; that the admission of these principles amounted to a confession of the usurpation and injustice of every other government; and that treating with France would involve an acknowledgment of those principles which condemned the usurpation of all other governments, and denied the very power which they were exercising. Mr Fox accused the minister of tergiversation, and contended, that he had in fact found it necessary to alter his conduct; and that the impolitic speech which he had put into the mouth of his majesty, at the opening of the session, had made a serious impression upon the public. What, he asked, would have been the feelings of Englishmen, if

the convention had determined never to treat with them until there was a reform in the English government? He recalled to the recollection of Mr Pitt the declaration of his father, that they should die in the last breach before they granted the independence of America; yet the first act of the political life of the son had been to sign the very independence which his father had deprecated. Necessity had dictated that act; and he must now, on the same account, retract his declaration respecting France. The motion was opposed by Mr Dundas, on the ground that it would fetter the executive government in their negotiations for peace; and ultimately the motion was negatived, and the amendment adopted.

On the following day the Duke of Bedford brought forward, in the House of Lords, a motion similar to that which Mr Grey had introduced into the House of Commons; and Lord Grenville moved an amendment precisely similar to that which had been proposed by Mr Pitt and carried in the House of Commons. A great deal of discussion followed; but ultimately a large majority voted in favour of the amendment. The victories of the French during the last campaign, and the despair of ultimate success in the war, which now began to be entertained throughout the country, encouraged opposition to renew the subject under a variety of forms, and to urge ministers to enter into a negociation; but on every occasion the motions made by them were negatived by a similar superiority of numbers.

The number of seamen and marines voted during the present session amounted to a hundred thousand, whilst a hundred and nineteen thousand three hundred and eighty men were voted to form the guards and garrisons. In order to procure the requisite number of seamen, the parliament required the merchants to give up a part of the crews of their shipping, in proportion to the tonnage, and ordered every parish to furnish one man for the service. A loan of L.18,000,000 was found necessary, together with a large issue of exchequer bills, as the supplics voted amounted to no less than L.29,307,000. The new taxes were made payable on wine, spirits, tea, coffee, stamps on deeds, insurance on ships and cargoes, timber, and on persons wearing hair-powder.

During the present session the trial of Mr Hastings was at length brought to a conclusion. The subject was discussed in a committee of the House of Lords. The lord chancellor and the Earl of Carnarvon considered Mr Hastings as criminal; but he was ably defended by Lord Thurlow, who was supported by the Marquis of Lansdown, the Bishop of Rochester, and others. When every part of the accusation had been disallowed by the committee, the report was reviewed by the house; and after some debates on the mode of proceeding, it was resolved that the question should be put separately on sixteen points. The greatest number of peers who voted the defendant guilty in any one respect did not exceed six, whilst the votes of not guilty on some of the charges were twenty-six, in others twenty-three, and in one nineteen. The lord chancellor then intimated the decision of the court to Mr Hastings, who received it in silence, and withdrew.

At this time the debts of the Prince of Wales amounted to L.630,000; but it had been arranged at court that these debts should be paid, and that the prince should marry his cousin, the daughter of the Duke of Brunswick; and after some discussion in the House of Commons, his establishment was fixed at L.125,000, out of which he was required to pay L.65,000 a year until his debts were liquidated. The rents of the duchy of Cornwall, amounting to L.13,000, were also set apart for the extinction of the debts; and further sums were voted to defray the expenses of the marriage, as well as the repairs and decorations of Carlton House.

Reign of
George III.

Parliament was prorogued on the 27th of June by a speech from the throne, in which ministers thought it prudent to hold out to the public some prospect of negotiation.

The incidents of the war during the year 1795 were less memorable than those of the preceding years. Lord Bridport, with an inferior force, attacked a French fleet near Port l'Orient, and took three of their ships. Vice-admiral Hotham pursued to the Genoese coast a fleet which had sailed from Toulon to attempt the recovery of Corsica, and had captured one of his detached ships; and having brought the enemy to a partial engagement, he took two sail of the line; but he afterwards lost one of his own ships in consequence of damage sustained in the conflict. On the western coast of France, the enemy, with thirteen sail of the line and fourteen frigates, avoided coming to an engagement with Vice-admiral Cornwallis, who had only eight ships including frigates. These events occurred early in summer. But notwithstanding the vigilance of the British navy, the French captured, in the month of July, thirty sail of a valuable convoy returning from the Mediterranean, and also made prize of part of a Jamaica fleet; but, on the other hand, their own commerce had sunk so low as to present few objects of attack to our cruisers and privateers.

As the Dutch, though nominally the allies of the French, had, in fact, become subject to them, letters of marque were issued against them by Great Britain, and directions given to seize their colonial territories, under the professed intention, however, of restoring them when the stadtholder's government should be re-established. The Cape of Good Hope was taken, together with Trincomalee and the other Asiatic settlements of the Dutch, excepting only Batavia. Their territories in the West Indies were not attacked during the present year, on account of the difficulties which the British experienced in that quarter in keeping in subjection the islands captured from the French, where various insurrections were incited by their ancient masters. Jamaica was also kept in a state of great alarm by a small tribe of independent negroes, called Maroons, who had long existed in the mountainous parts of the island. These people, having quarrelled with the white inhabitants, committed many cruel ravages, and were not subdued till Spanish hunters and blood-hounds were procured from the island of Cuba, and employed against them, which induced them at last to submit to deportation from the island.

The British ministry resolved, when it was too late, to give assistance to the royalists in the western parts of France; and an expedition, planned by Mr Windham, and guided by French emigrant officers, with troops, many of whom consisted of prisoners of war, relieved from confinement on condition of bearing arms against their native country, set sail for the French coast, and landed upon the extremity of the narrow peninsula of Quiberon. Here they fortified themselves; but many of the troops proving unfaithful, and the expedition being otherwise ill conducted, they were speedily overpowered by the republicans, who put to death such of their countrymen as they found in arms fighting against them. By this feeble and ill-timed invasion of the French territory, nearly ten thousand men were killed or taken prisoners.

The continental campaign on the side of Germany was of little importance during this year, but upon the whole it proved unfavourable to the French. The convention had shaken off the yoke of that sanguinary faction which, under Robespierre and his frantic associates, had deluged the interior of France with blood, but had nevertheless the merit of calling forth with astonishing energy the powers of the country for the support of its independence. The present leaders possessing less activity, and affecting a

milder course of conduct, the military operations languished; and the French army remained inactive till autumn, when it crossed the Rhine near Mentz under General Pichegru, but was speedily repulsed, and an armistice concluded for the winter. The convention, however, established a new form of government, consisting of an executive directory of five persons, elected by two representative bodies, to which the powers of legislation were intrusted; and it was expected, that if the war continued, the new executive power would endeavour to distinguish itself by some important operations.

The British parliament was again assembled at an early period, namely, on the 29th of October. The state of public affairs wore at this period an unfavourable aspect. The French armies had been inactive during the summer, but they had lost nothing; for the new republic retained possession of the territory extending from the Pyrenees to North Holland, and consequently of an immense length of coast opposite to Great Britain. Meanwhile, a dearth of provisions began to prevail at home. The winter, which had set in with extreme severity at the close of the year 1794, and had enabled the French to conquer Holland with little difficulty, was followed by an ungenial summer, during which the crop failed in consequence of almost incessant rains. This state of things was productive of discontent among the lower orders, and the war was blamed as tending to aggravate the distress which they thus suffered. Previous to the assembling of parliament some meetings were held by the London Corresponding Society, for the purpose of petitioning the king and parliament in favour of peace and of parliamentary reform; and as the meetings were held in the open fields, they were very numerously attended, but the persons composing them dispersed without disturbance. At the opening of parliament, however, some riots took place.

His majesty proceeded from the palace to open the session of parliament at the usual hour; and the crowd in St James's Park, which is always considerable on these occasions, was certainly much greater than usual. A fine day, and a rumour which had been circulated that a riot was likely to take place, contributed greatly to increase the multitude of the spectators. As the royal carriage passed along the park, the predominant exclamations uttered were "Peace, peace! Give us bread: No Pitt; no famine; no war!" and a few voices were heard to exclaim, "Down with George," or words to that effect. In the park and the streets adjacent to Westminster, stones and other missiles were thrown, some of which struck the state coach, and one of them, supposed to have been thrown from a house in Margaret Street, perforated a window of the carriage by a small circular aperture. From this circumstance it was alleged to have been a bullet discharged by an air-gun, or by some similar engine; but no bullet was found; and happily it neither touched the king nor the noblemen who attended him. As his majesty returned from the house through the park, the gates of the horseguards were shut to exclude the mob; yet even this precaution was not sufficient to prevent a renewal of the outrages, and another stone was thrown at the carriage as it passed opposite to Spring Garden Terrace. After the king had alighted at St James's, the populace attacked the state-carriage, and, in its way through Pall-mall to the Mews, it was almost entirely demolished. The speech from the throne stated that the general situation of affairs, notwithstanding many events unfavourable to the common cause, was materially improved; that the French had been driven back in Italy, and checked on the side of Germany; that their successes, and the treaties of peace which they had entered into, were far from compensating the evils they had suffered from the continuance of war;

Reign of
George III.

of that the unparalleled embarrassment and distress of their internal situation had produced an impression that their only relief must result from peace and a settled government; that the crisis in which they now were must probably produce consequences important to the interests of Europe; and that if this crisis terminated in any thing affording a reasonable expectation of security in any treaty, the appearance of a disposition to treat for peace on just and suitable terms would be met, on the part of the British government, with an earnest desire to give it the speediest effect. In the speeches for and against the usual addresses little novelty occurred, the expediency of continuing the war having been so often discussed before.

Meanwhile administration took advantage of the attack upon his majesty's person to issue a proclamation, connecting the meetings of the Corresponding Society with the insults offered to his majesty, and also to bring forward two new penal statutes. The first was introduced into the House of Lords by Lord Grenville, and entitled an act for the preservation of his majesty's person and government against treasonable and seditious practices. One clause enacted capital punishment against every one who should express, utter, or declare, by the publication of writings, or by any overt act, such imaginations, devices, or intentions, as were calculated to injure the king, impair his authority or that of the parliament, or promote an invasion of his dominions; another provided, that all declarations tending to excite hatred or contempt of the king should be considered as high misdemeanours; and a third, that a second offence might be punished, either in the ordinary mode, or by banishment from the realm for a term not exceeding seven years. The other bill, introduced by Mr Pitt into the House of Commons, provided, that no meeting of any description of persons, exceeding the number of fifty, except such as might be called by sheriffs or other officers or magistrates, should be holden for political purposes, unless public notice had been previously given by seven housekeepers; that if such a body should assemble without notice, and twelve or more individuals should continue together, even quietly, for one hour after a legal order for their departure, they should be punished as felons, without benefit of clergy; and that the same rigour might be exercised, if any person, after due notice of the meeting, should use seditious language, or propose the irregular alteration of any thing by law established. With regard to the delivery of lectures or discourses, or the exercise of debate on topics connected with the laws and government of the country, a license was declared to be necessary. Very animated discussions took place upon these bills in both houses of parliament, and many petitions were presented against them; whilst, on the other hand, various corporations and public bodies petitioned for their enactment. But the result nevertheless was, that the bills were passed by great majorities.

Still, however, administration were sensible that it would become necessary, for the sake of preserving their popularity, to assume an appearance of willingness to put an end to the war; and accordingly, whilst the bills were under discussion, each house received a message from the king, in which, alluding to the new constitution, and the directorial government of France, he stated that such an order of things had arisen as would induce him to meet any desire of negotiation on the part of the enemy with a full readiness to give it the speediest effect. An address of thanks having been moved, Mr Sheridan suggested an amendment, tending to promote immediate negotiation, and to remove all obstacles to the attainment of peace; and Mr Fox also wished that the first advances should proceed from our court; but Mr Pitt and Mr Dundas thought it advisable to wait until the enemy manifested a disposi-

tion to negotiate. Similar observations were made in the House of Peers. A species of advance towards negotiation was nevertheless made soon afterwards on the part of Britain, though in a very oblique and indirect mode. Mr Wickham, his majesty's minister to the Swiss cantons, transmitted, on the 8th of March 1796, a note to M. Barthélemy, the French ambassador at Berne, stating that he himself was not authorized to enter into any negotiation, but requesting information in writing on the part of the French court about three points; first, whether France was disposed to send ministers to a congress to negotiate a general peace with his Britannic majesty and his allies; secondly, whether the French government were willing to state the general grounds upon which they would consent to conclude a treaty; and, thirdly, whether the French government would think fit to propose any other mode of arriving at a general pacification. M. Barthélemy returned an answer on the 26th of the same month, stating that the executive directory doubted the sincerity of these overtures of peace, from the proposal of a general congress, which would lead to endless negotiations, and from Mr Wickham not having received powers to negotiate; asserting the willingness of France to make peace; but declaring that the executive directory had no power to relinquish any of the territories which the constitutional act had declared to form an integral part of the French republic. With regard to the other territories occupied by the French armies, these might become objects of negotiation. But as the Netherlands and the island of St Domingo had been declared by the new French constitution to form part of the territory of the republic, the British government immediately published a note intimating that these pretensions on the part of France were totally inadmissible; and that while they were persisted in, nothing was left but to prosecute a war equally just and necessary. This first attempt towards negotiation for peace gave rise to various debates in the British parliament, in all of which administration were supported by their usual majorities.

Supplies were voted during this session to the amount of L.37,588,000, and upwards of twenty-five millions and a half were borrowed. As no prospect existed that British armies could be employed on the Continent, the guards and garrisons were reduced to forty-nine thousand men; the forces in the colonies were increased to seventy-seven thousand; and the sailors and marines amounted to a hundred and ten thousand. Taxes were imposed on legacies to collateral relations, and on horses, and dogs, and hats; the assessed taxes were increased, and also the duties on wine, tobacco, salt, and sugar. Parliament was dissolved on the 20th of May, and new elections immediately took place.

An extremely active campaign was now opened by the French upon the Continent. Their generals, Moreau and Jourdan, penetrated into Germany; but they were ultimately repulsed by the Archduke Charles, though not till they had reached the vicinity of Ratisbon. The retreat of Moreau, amidst hostile armies, and through the difficulties and entanglements of the Black Forest, formed one of the principal events of the war, and has been much lauded by some military writers, though severely criticised by Napoleon. On the side of Italy the French obtained greater success. Their new general in that quarter, Bonaparte, turned the Alps by the Col di Tende, and gaining in rapid succession the victories at Montenotte, Millesimo, and Dego, compelled the king of Sardinia to desert the allies, and to purchase peace at the expense of a considerable portion of his territory. He next descended into the Milanese; obliged the Italian states to surrender their finest paintings, statues, and other curiosities, together with large sums of money, as the price of peace; and after a

Reign of
George III.

multitude of sanguinary conflicts at Lodi, Arcole, Lonato, Castiglione, Rivoli, and other places, he succeeded in subduing, by famine, Mantua, the only fortress that remained to the Austrians in Italy. Few maritime events of much importance occurred. The Dutch were deprived of their whole intertropical possessions, with the exception of the unhealthy but rich settlement of Batavia, in the island of Java; and they also lost a squadron which they had sent out to attempt the re-capture of the Cape of Good Hope, but which was itself made prize of by the British admiral Sir George Elphinstone, afterwards Lord Keith. On the other hand, the British were under the necessity of abandoning Corsica, in consequence of the conquests of Bonaparte in Italy, and the mutinous spirit of his countrymen the Corsicans. The result of the campaign was, that the British ministry, in order to appease the nation, found it necessary to send Lord Malmesbury to Paris on the pretence of attempting to negotiate a peace; but it was afterwards admitted by Mr Pitt that they had no wish to conclude a treaty, and that the measure was adopted merely in compliance with the wishes of the public. Accordingly, as the French still refused to relinquish their hold of the Netherlands, this was accounted a sufficient reason for persevering in the war.

In the early part of the session of parliament, which met on the 6th of October, there occurred few debates, on account of the intention to attempt an immediate negotiation, which had been announced in the king's speech, and afterwards from expectation of its issue. But at the close of the year the French directory, in consequence of an invitation from a disaffected party in Ireland, sent an expedition of seventeen ships of the line and many smaller vessels, having on board an army of eighteen thousand men under General Hoche, to invade that country. The violence of the weather prevented this armament from assembling at the rendezvous in Bantry Bay, and no landing was in consequence attempted; so that the fleet returned home with the loss of two ships of the line and two frigates, which perished in a tempest, and of one frigate taken by the English. Shortly afterwards the French disembarked on the coast of Pembrokeshire twelve hundred and fifty criminals, whom they had sent as soldiers upon the Irish expedition, and knew not how to dispose of after the failure of that attempt.

At this period the first instance of serious difficulty occurred in the management of the British funding system. The large sums of money sent abroad as subsidies to foreign princes by government had diminished the quantity of gold and silver in Great Britain, whilst administration, through the medium of the Bank of England's paper, had issued immense sums for the public expenses, and in payment of the additional interest of the national debt. The alarm occasioned by the Irish invasion coming in addition to these circumstances, produced a run upon the bank to exchange its paper for specie; and as their coffers were soon drained, they found themselves under the necessity of giving a premium for bullion, which they paid with their paper. This made matters worse, as certain persons secretly melted down the guineas which the bank had caused to be coined and issued, and sold the gold to the bank as bullion for the sake of the premium. A ruinous traffic was thus carried on by the bank, which purchased bullion at a high rate, while they gave out their guineas at par. The directors, therefore, were under the necessity of laying their case before the privy council, which, after considering the circumstances of the case, issued an order authorizing the bank to discontinue the payment of their notes in cash. Considerable alarm was occasioned by this step; and committees of both houses of parliament were appointed to inquire into the state of the bank's affairs.

But although these were reported as prosperous, yet each committee recommended a continuance of the restriction; and an act was therefore passed for confirming it, while, to render it less inconvenient, bank notes for one and two pounds were put into circulation. As the bank of England is the medium through which the British government issues all payments, and as these payments were made in the bank's paper, which administration might induce the directors to augment indefinitely, many persons feared and predicted that this paper would speedily sink in value when compared with gold and silver, as the French assignats and the American paper currency had done when rendered inconvertible at pleasure into specie. The stability of the British funding system, however, speedily displayed itself. The credit of the bank's paper remained unshaken, because government received it in payment of all taxes; and although depreciation soon followed, and prices necessarily rose, yet, from confidence in our resources, and a conviction of the immutability of the national faith, this depreciation was confined within narrower limits than it would have reached in other countries not so favourably circumstanced, and the credit of the paper continued unaffected by an operation which would have utterly ruined it anywhere else.

During the preceding year the emperor had received a subsidy, under the name of a loan, from the British government, and a new subsidy was now given him under a similar denomination. To supply this and the rest of the national expenses, £27,647,000 were voted early in the session, and afterwards above fifteen millions additional were thought necessary, and voted. Two loans were negotiated by government; one of sixteen millions and a half, in the usual way, from money-brokers; and another of eighteen millions, called the Loyalty Loan, from the nobility and gentry being requested to fill it up, which they did with great eagerness. The troops voted consisted of a hundred and twenty thousand seamen; sixty thousand seven hundred and sixty-five soldiers for European service, and above sixty-four thousand for the dependencies of Great Britain. As the threat of invasion was now revived, a large supplementary body of militia was levied, together with a considerable force consisting of cavalry. The interest of the two loans was provided for by taxes upon houses, stage-coaches, horses, auctions, stamps on agreements and newspapers, ornamental plate, spirits, tea, coffee, and other articles. Towards the close of the session the opposition brought forward motions to address the king to dismiss his ministers, resume the negotiation with France, and repeal the two acts introduced in the preceding session, by Lord Grenville and Mr Pitt, for extending the treason laws, and imposing restrictions upon popular meetings for political purposes. They were encouraged by a variety of addresses which were presented to his majesty at this time from different parts of the country, advising him to dismiss the present ministry; but, as usual, their efforts proved unavailing.

The French had now acquired such an ascendancy over the Spanish monarchy, as to induce the government of that country to declare war against Britain; and soon afterwards the Spanish fleet, amounting to twenty-seven sail of the line, attempted to join a French armament; but they were attacked by Sir John Jervis on the 14th of February, near Cape St Vincent, with only fifteen sail of the line; and four of their ships, of from seventy-four to a hundred and twelve guns, were made prizes by the British fleet. This victory may be regarded as the first of that mighty series of naval triumphs with which the name of Nelson is indissolubly associated. The British force consisted of two ships of a hundred guns, two of ninety-eight, two of ninety, eight of seventy-four, and one of

Reign of George III. sixty-four, with four frigates, a sloop, and a cutter. The Spaniards had one four-decker of a hundred and thirty-six guns, six three-deckers of a hundred and twelve, two eighty-fours, and eighteen seventy-fours; with ten frigates and a brig. The disparity of force was therefore prodigious. The British were formed in two lines in the most compact order of sailing; and, by carrying a press of canvass, Sir John Jervis came up with the enemy's fleet at half-past eleven on the 14th, before it had time to collect and form a regular order of battle. Not a moment was to be lost; so, departing from the regular system, the British passed through their fleet, in a line formed with the utmost celerity, tacked, and thereby cut off nine ships, or one third, from the main body. The vessels thus separated attempted to form on the larboard tack; but only one of them succeeded, under cover of the smoke, which prevented her intention being discovered till she had reached the rear; whilst the others were so warmly received that they put about, and did not again appear in the action till towards its close. The admiral now made a signal to tack in succession; but Nelson, whose station was in the rear of the British line, perceiving that the Spaniards were bearing up before the wind with an intention of forming their line, going large, and joining their separated ships, or avoiding a close engagement, disobeyed the signal, without a moment's hesitation, and ordered his ship to be wore. This at once brought him in contact with the Santissima Trinidad of a hundred and thirty-six guns, the San Josef of a hundred and twelve, the Salvador del Mundo of a hundred and twelve, the San Nicolas of eighty, the San Isidro of seventy-four, another seventy-four, and another first-rate; but Trowbridge, in the Culloden, immediately joined, and nobly supported him; and for nearly an hour did the Culloden and the Captain, Nelson's ship, maintain the most terribly unequal contest recorded in the annals of naval warfare. At length the Blenheim, passing between them and the enemy, gave them a respite, while she poured in her fire upon the Spaniards. The Salvador del Mundo and San Isidro now dropped astern, and were fired into in a masterly style by the Excellent, Captain Collingwood. The San Isidro struck, and the Salvador also hauled down her colours; but Collingwood, disdaining the parade of taking possession of beaten enemies, pushed on, with every sail set, to save his old friend and messmate, Nelson, in the Captain, which was at this time fired upon by three first rates, by the San Nicolas, and by a seventy-four; whilst the Blenheim was ahead, and the Culloden, crippled, astern. Ranging up in the noblest style, and hauling up his mainsail just astern, Collingwood passed within ten feet of the San Nicolas, and giving her a tremendous fire, passed on to the Santissima Trinidad. The San Nicolas then luffed up, when the San Josef fell on board her, and Nelson resumed his station abreast of them, and close alongside. But the Captain being now incapable of further service, either in the line or in chase, Nelson directed the helm to be put to starboard, and the boarders to be called up. His orders were instantly obeyed; the San Nicolas was boarded, and, after a short but sharp contest hand to hand, carried in the most brilliant manner. But a fire of pistols and musketry having been opened on the victors from the stern gallery of the San Josef, Nelson, directing his captain to send more men into the prize, gave orders for boarding that ship from the San Nicolas; and, leading the way himself, exclaiming "Victory or Westminster Abbey!" the thing was executed in an instant, with an energy and enthusiasm which rendered all resistance hopeless. But the Spaniards had still eighteen or nineteen ships which had suffered little or no injury; and as the part of the fleet which had been separated from the main body in the

morning was now coming up, Sir John Jervis made signal to bring to. If the enemy had chosen at this moment to avail themselves of their great superiority of force, the situation of the British admiral would have been most critical. His ships could not have formed without abandoning those which they had captured, and running to leeward; the Captain was lying a perfect wreck on board her two prizes, with her fore-topmast shot away, and not a sail, shroud, or rope left, while her wheel was smashed; and many of the other ships were so shattered in their masts and rigging as to be wholly unmanageable. But the Spanish admiral, Don Josef de Cordova, having inquired of his captains whether they judged it proper to renew the action, and nine having answered in the negative, whilst others gave their opinion in favour of delay, abandoned all idea of recommencing the battle, and drew off, leaving the British in possession of the prizes which they had so gallantly won. For this victory the commander-in-chief was rewarded with the title of Earl St Vincent, and Rear-admiral Nelson had the order of the Bath given him. It was his skilful and daring disobedience of orders which rendered the battle decisive.

At the commencement of the summer an event occurred which, had the French been prepared to attempt an invasion of this country, might have been productive of serious evils. This was a mutiny in the fleet. Gross impositions had for some time been practised upon the seamen, both as to the quantity and quality of the provisions allowed them; and they had made an anonymous application for redress to Earl Howe. But the application was disregarded, because the strictness of discipline prevented the open avowal or appearance of discontent, which his lordship inconsiderately supposed had no existence; and the seamen, disappointed of the expected relief, resolved to enforce the consideration of their claims. Accordingly, when orders were given to prepare for putting to sea, the crew of the Queen Charlotte, and other ships lying at Spithead, refused to act; and treating with contempt the remonstrances of the officers, they made choice of delegates, who after a formal consultation drew up petitions to the board of admiralty and the House of Commons. Earl Spencer, first lord of the admiralty, dreading a dangerous mutiny, and not thinking the demands of the seamen unreasonable, promised compliance; and the king readily offered full pardon to all who should immediately return to their duty. But the seamen would not be satisfied till the parliament had confirmed the promises of the admiralty; and as some delay thus ensued, the irritation of their minds led to a contest with Vice-admiral Colpoys, in which some lives were lost. An act, however, was passed for the gratification of the seamen in point both of pay and provisions; and subordination was restored at Spithead and Plymouth. The concession of these claims encouraged the seamen at the Nore to insist on a more punctual discharge of arrears, a more equal distribution of prize-money, and a general abatement of the severity of discipline. A council of delegates was elected, at the head of which was a seaman named Richard Parker, who took the command of the fleet, and prevailed upon the men to reject repeated offers of pardon. He robbed two merchant ships of provisions, obstructed trade by the detention of other vessels, and fired on some ships of war which refused to accede to the mutinous combination. An act of parliament was passed in the beginning of June, denouncing capital punishment against all who should hold intercourse with the rebellious ships, or voluntarily continue on board; and as the public strongly disapproved of this last mutiny, for which no excuse could be offered, the seamen gradually returned to their duty. Parker was apprehended, and, along with several other mutineers, punished with death; and a

Reign of George III.

Reign of
George III.

considerable number were also condemned after trial, but the greater part of them were pardoned.

During the summer the port of Cadiz was blockaded by the British fleet under Sir John Jervis, now Earl St Vincent; and an attempt was made against the Spanish island of Teneriffe, but without success. Meanwhile another fleet under Admiral Duncan watched the Texel; but the blockading force having retired for a short time, the Dutch fleet, under Admiral De Winter, put to sea. Intelligence of this event having been brought to Admiral Duncan at Yarmouth, he instantly proceeded in quest of the enemy; and about eleven o'clock in the forenoon of the 11th October 1797 he got sight of the squadron which had been left to watch their motions, and which displayed signals of an enemy to leeward. Admiral Duncan immediately made signal for a general chase, and soon got sight of the Dutch, forming in a line on the star-board tack to receive him, the land between Camperdown and Egmont being then about nine miles to the leeward. On making this discovery, he shortened sail to connect the squadron; and finding there was no time to be lost in making the attack, he made signal to bear up, break the enemy's line, and engage each ship her opponent to leeward, without waiting to form the line of battle. The order was promptly and gallantly obeyed; Vice-admiral Onslow, in the *Monarch*, bore down on the enemy's rear, his division following his example; and about forty minutes past twelve o'clock the battle commenced. Admiral Duncan, in the *Venerable*, also passed through the enemy's line, at the head of his division, and began a close action with the enemy's van, which lasted two hours and a half, when all the masts of the Dutch admiral's ship were observed to go by the board, and she not long afterwards struck to her opponent. The Dutch vice-admiral's ship being also dismasted, surrendered to Vice-admiral Onslow, and nine others became the prizes of the conquerors. The battle was obstinate and sanguinary; but its decisive results may be ascribed to the bold manœuvre of instantly pushing between the enemy and the land, to which they were fast approaching. Had Admiral Duncan waited to form line of battle, in the ordinary way, there either would have been no action at all, or if the British had attacked, the Dutch admiral, by getting nearer to the shore, would probably have drawn both fleets on it, which would have been a victory to him. The force on both sides was nearly equal, each squadron consisting of sixteen ships of two decks; but of the British not more than ten ships were seriously engaged, and these captured eleven of the enemy. Had Admiral Duncan's fleet been composed of the same materials as Lord St Vincent's, every Dutch ship would have been taken; and the same result would have followed had all the ships followed the example set them by the *Venerable*. The fact is, however, that the British squadron was composed of very indifferent and inadequate vessels, many of them having been intended for Indiamen; and that it was otherwise in many respects ill conditioned and deficient; but there was no want of gallantry on the part of the crews, and when the main-top-gallant mast of the *Venerable* was shot

away, a seaman of the name of Crawford nailed the flag to the top-mast head.¹ This victory excited the most lively joy in the British nation, from its tendency to put an end to all dread of invasion.

While their allies, or rather subjects, were suffering these disasters by sea, the French armies triumphed on the Continent. Bonaparte advanced from Italy against the centre of the Austrian dominions, and, after several sanguinary conflicts, crossed the Alps where they approach the frontiers of Hungary, and forced the emperor to conclude preliminaries of peace at Leoben, on the 18th of April, which were followed by a definitive treaty, signed at Campo Formio, near Udine, on the 17th of October. The emperor acquired the city of Venice; but he relinquished the Milanese and the Netherlands, and, by secret articles, consented that the Rhine should form the boundary of France. Britain being now left alone in the contest into which she had originally entered as an auxiliary to Austria and Prussia, the government opened a negotiation towards the close of the summer; and as both the French and British nations eagerly wished for a termination of this sanguinary contest, it is probable that administration seriously wished to conclude a treaty; but at this time a party, headed by the director Barras, had gained the ascendancy in France, and resolved to continue the war. A demand was therefore made that Britain should renounce every conquest as a preliminary to negotiation, whilst France reserved a right to make further demands; and on this being refused, the British ambassador, Lord Malmesbury, was dismissed from Lisle, where the negotiations had been opened.

Parliament assembled on the 2d of November. In the speech from the throne his majesty stated his concern that his endeavours to restore peace had been rendered ineffectual, and expressed the fullest reliance on the magnanimity and courage of the people. During this session of parliament few or none of the members of opposition attended. At the close of the preceding session they had declared it to be their intention to retire from parliament; and they justified their conduct by alleging that, in times when every man who censured the measures of administration was regarded as in league with the enemy, it was equally painful and useless to incur such odium; that if they declared their sentiments, they were proclaimed as the enemies of the king, and if they tacitly acquiesced in the measures of the minister, they voluntarily took upon themselves a share of the responsibility; that they had done their utmost to prevent the war, and had urged repeatedly the necessity of bringing it to a speedy termination, without persuading their opponents; that events must now take their natural course; and that as they could not aid by their counsel, it should not be said that they embarrassed by their opposition. This retirement of opposition was much resented, and spoken of with great bitterness, by the friends of administration, as it suggested to the nation the idea that government was conducted by the power of the crown alone, unchecked by any discussion of its measures in the two legislative assemblies.

The inability of the bank of England to pay upon demand its notes in specie, according to ancient custom and

¹ The following characteristic anecdote has been related of an officer who distinguished himself by his gallantry in this action. Captain Inglis of the *Belliqueux* of sixty-four guns, owing either to long absence from the service, or to an inaptitude not very uncommon among naval officers of the old school, had neglected to make himself master of the signal-book; and on the morning of the day of battle, when it became necessary to act with promptitude, in obedience to the signals, he found himself more puzzled than enlightened by it. After poring over it for some time, without being in any degree benefited by the perusal, he threw it with contempt upon the deck, exclaiming in broad Scotch, "Damn me, up wi' the hellem and gang into the middle o't." These words are instinct with the true spirit of battle, and show that Captain Inglis bravely anticipated the remedy in such cases provided by Nelson, who, in his celebrated memorandum on the eve of the mighty combat of Trafalgar, observes, that "if a captain should be at a loss, he cannot do very wrong if he lay his ship alongside of the enemy." In strict conformity with this doctrine, the *Belliqueux* lost no time in "ganging into the middle o't," by attacking the enemy's van, which she contributed to throw into confusion, although she got rather roughly treated by them before she could be supported.

of the terms of the obligation contained in these notes, appears now to have created in Mr Pitt's mind some dread respecting the funding system, and an apprehension, that from the immense sums annually borrowed, and the corresponding quantity of paper-money necessarily issued to pay the interest of the loans, the system might be carried so far as to discredit the paper-money issued in the name of the bank of England. And this apprehension was strengthened by a fact, of which everybody was daily becoming more sensible, namely, that the money price of all kinds of property in Great Britain had rapidly risen during the war; and this rise of price was justly ascribed to a gradual sinking in the value of money, or of paper, the only money used in Britain, in consequence of its too great abundance. Mr Pitt therefore proposed, instead of borrowing the whole sum necessary to defray the expense of the war, and imposing no more taxes than were requisite to pay the interest of the loan, that heavier taxes should be imposed, in order to defray a portion of the extraordinary expenditure. Accordingly an act was passed for raising seven millions within the year; and this was to be effected by augmenting the assessed taxes, but so as not to compel any individual to pay more than one tenth of his income. The leading members of opposition attended to oppose this extraordinary measure, but without effect.

As the French were now disencumbered of all other adversaries, it was naturally expected that they would turn their arms in a more direct manner than formerly against the British empire. The result of the combination of the states of Europe for the partition of France had been extremely disastrous, and had left the new republic in possession of an extent of territory which the ablest and most ambitious of the French monarchs had in vain aspired to possess. The command which they had now obtained of Holland rendered France more dangerous than formerly, by the superior means of invasion which an additional extent of coast and the possession of a large quantity of shipping might afford; and had the French navy been less weak, or the French rulers possessed of greater ability, a dangerous crisis in the history of Great Britain might at this period have occurred. It never was the interest of any British administration to conceal from the public at large the possibility of a foreign invasion; and as the French government at this time boasted of their intention to make such an attempt, and ordered a considerable army to advance to the sea coast, it became the duty of ministers in Great Britain to make preparations to resist any such effort. Accordingly they came forward in parliament to propose measures of defence; and the danger with which the nation considered itself as threatened obliged all men in some measure still to adhere to an administration which in other respects might have lost their popularity from the ill success of their late measures. On the 8th of February 1798 Mr Dundas introduced into the House of Commons a bill to enable the king to incorporate in the regular militia a portion of the supplementary militia. And this bill being passed with little debate, the same minister, on the 27th of March, moved for leave to bring in another, to enable his majesty to provide for the security and defence of these realms, and to indemnify persons who might suffer injury in their property by the operation of such measures. The object of this bill was to provide for every possible emergency, by giving a power to his majesty to discover what persons were prepared to appear in arms and to be embodied for the public defence; and also to ascertain what number of the inhabitants of certain districts would be able to act as pioneers, or in other laborious situations. The other provisions were, that in the event of its being necessary to employ persons as pioneers to remove stock, or assist in facilitating the carriage of

military stores, proper compensation would be made; and the bill was also intended to give a power of embodying a portion of the regular militia, and employing them in the defence of the country. This bill was passed into a law after some unimportant debates, the principal members of opposition not usually attending.

As it was supposed that the war, on the part of Britain, would occasion greater expense than when all Europe had been engaged in it along with her, the supplies were augmented to £35,000,000; and, with a view to draw resources from distant parts of the country, instead of raising large loans for the public service, which were negotiated in London alone, Mr Pitt brought forward a scheme by which proprietors of land were enabled to redeem the land-tax; in other words, the owner of land, and, failing him, any other person, was to be permitted to purchase this tax, by a transfer of stock, which produced a dividend greater than the amount of the impost. The measure became law, but produced little immediate effect.

On the 25th of May Mr Pitt brought forward a bill in the House of Commons, with a view to increase the navy, and to resist with greater success the threatened invasion. On this occasion an event occurred, which indicated, that by the long possession of power, and the support he had received from the nation, Mr Pitt had suffered to grow upon him a certain haughtiness of manner and impatience of contradiction, which, in former times, would have proved extremely inconvenient to a British minister. On the subject of his proposed bill, he observed, that the object he had in view was to suspend, for a limited time, the protections which various descriptions of persons enjoyed, to prevent them from being impressed into the service of the navy; and he stated it as his wish that the bill should that day pass through its different stages, with a suitable pause at each if required, and that it should be sent to the Lords for their concurrence. Mr Tierney remarked on the very extraordinary manner in which Mr Pitt called upon the house to adopt this measure. He had imagined that the augmentation of the navy was to be provided for in the usual way; or, if any very uncommon mode was to be resorted to for the attainment of that object, that notice would have been given to the house. He had heard no arguments that proved its propriety; and even if he had, some time ought to have been allowed to weigh the force of such arguments, before proceeding to give three or four votes on a measure, of which no notice of any kind had been given. If the ministers persisted in hurrying the bill through the house in the manner proposed, he must give it a decided negative; and, indeed, from what he had already seen, he must view all their measures as hostile to the liberties of the subjects of this country. Mr Pitt replied, that if every measure adopted against the designs of France was to be considered as hostile to the liberty of this country, then indeed his idea of liberty differed widely from that of the honourable gentleman. He observed that he had given notice before of the present motion, and that if it were not passed in a day, those whom it concerned might elude its effects. But if the measure was necessary, and if a notice of it would enable its effects to be eluded, how could the honourable gentleman's opposition be accounted for, except from a desire to obstruct the defence of the country? Mr Tierney called Mr Pitt to order; and the Speaker observed, that whatever had a tendency to throw suspicion on the sentiments of a member, if conveyed in language that clearly marked that intention, was certainly irregular. Mr Pitt replied, that if the house waited for his explanation, he feared it must wait a long time. He knew very well that it was unparliamentary to state the motives that actuated the opinions of gentlemen; but it was impossible to go into arguments in favour of a

Reign of
George III.

question, without sometimes hinting at the motives that induced an opposition to it. He submitted to the judgment of the house the propriety of what he argued; and he would not depart from any thing he had advanced, by either retracting or explaining it. The result of this altercation was a duel on the following Sunday between Mr Pitt and Mr Tierney. They went to Putney Heath, attended by seconds, and, standing at the distance of twelve paces, fired two shots each; but Mr Pitt discharged his second pistol in the air, upon which the seconds interfered, and thus the affair terminated.

During the summer of this year a rebellion broke out in Ireland, the particulars of which will be stated in their proper place. The enthusiasm which the French revolution had kindled in so many quarters of Europe extended itself to Ireland. There, some men of ardent imaginations, chiefly Protestant dissenters, persuaded themselves that they could regenerate their country, cast off the dominion of Great Britain, heal the unhappy divisions among the inhabitants of Ireland, and convert it into an independent republic. As early as the year 1793 these persons formed themselves into a society, under the name of the United Irishmen, and were gradually joined by a very large proportion of the population of the country. They applied for aid from France; and it was in consequence of their urgent invitation that the unsuccessful expedition under General Hoche was undertaken. From that period the country remained in a state of the greatest alarm. On the one side rigorous laws were enacted, and every effort was made, by severity of punishment, to repress all appearance of opposition to the existing government; whilst, on the other, the common people busied themselves in the fabrication and concealment of pikes, or broke into the houses of country gentlemen, to seize whatever fire-arms they could discover. The schemes of the disaffected party were greatly disconcerted by the discovery and apprehension of their principal leaders. A rebellion, however, actually broke out; but, though attended with considerable destruction of human lives and of property, it was of a partial nature, and speedily suppressed. During its existence some circumstances occurred which completely demonstrated of how visionary a nature had been the schemes of those persons who hoped to establish in Ireland an independent government upon any basis that could afford a tolerable hope of national prosperity. The disaffected party among the Protestants, too weak to be able of themselves either to shake off the dominion of Great Britain, or to assume the ascendancy in Ireland, were under the necessity of calling in the aid of the Roman Catholics, who constitute the great mass of Irish population; and they were the more readily induced to do so, from a notion, which of late years had very generally gained ground in Europe, that religious sentiments form no proper ground of distinction in civil society, and from perceiving the facility with which the Catholics of France had set at defiance the religion of their fathers, when placed in competition with what they accounted the interests of freedom, or the means of aggrandisement to their country. But it speedily appeared that these new maxims of conduct could not be adopted by the superstitious and illiterate peasantry of Ireland. The Catholics were no sooner in arms than their chief animosity came to be directed, not against the dominion of Britain, nor against any form of civil government, but against their own countrymen of the Protestant faith, who must thus ultimately have fallen a sacrifice to the success of their own schemes. In short, it became evident that Ireland could not possibly exist in tranquillity, or with safety to the Protestant part of its inhabitants, independent of the supremacy of Great Britain.

Upon the Continent, the world was amused with a ne-

gociation carried on at Rastadt, between the French directory and the German empire. It was conducted with much slowness, and ultimately proved ineffectual. But whilst it was in progress, the French government, having contrived to quarrel with the Swiss cantons, invaded and seized their country, and converted it into a new republic, under their own influence. Austria, however, had been so much humbled by recent losses, that she did not venture, on this occasion, to assert the independence of Switzerland, although it must have been evident that her own independence was ultimately connected with that object. Switzerland consists of a vast assemblage of lofty and precipitous mountains, situated in such a manner as to divide the most important countries of Europe from each other. On one side these mountains look down upon the fertile territory of Italy; to the north they command the very centre of Germany; and to the west they are bounded by France. For ages they have been inhabited by a virtuous and fearless race of people, divided into petty communities, who contented themselves with maintaining their own independence; and though, as individuals, they entered into the military service of the neighbouring princes, yet, as a people, they had long ceased to take any part in the wars of Europe. For some centuries the independence of Switzerland proved the chief basis of the independence of the neighbouring nations. All parties respected and avoided any dispute with the Swiss, in a war against whom much might be lost, but nothing could be won. Accordingly, when the French attacked the Austrians, and when the Austrians attacked the French, the assailing party was under the necessity of sending its armies to a great distance from the centre of its own power. If defeated, the march homewards was long and difficult; whilst, even if tolerably successful, the attack never proved seriously dangerous, in consequence of its having been made in a remote quarter with limited means. Hence, in 1796, when the French generals Moreau and Jourdan marched through Suabia and Franconia to invade Austria, the length of their march afforded many opportunities of attacking them with success; and the invaded country had full leisure to call forth its whole resources against them. The result was, that when Jourdan sustained a defeat, the retreat of the other army became almost impracticable; and hence arose the unbounded reputation acquired by Moreau for accomplishing it with success. Had the French at that period occupied Switzerland, the retreat of Moreau would have been attended with little or no difficulty; because, by retiring into that rugged country, he could easily have made a stand against a very superior force for a considerable time, till he had received reinforcements. For the future, therefore, by commencing a war of invasion against Austria, not upon the frontiers contiguous to France, but at the eastern extremity of the Swiss mountains, the French, if successful, might reach the gates of Vienna in a few weeks. The independence of Switzerland, by placing these nations at a distance from each other, had hitherto prevented such an enterprise from being carried into effect; and the present removal of that barrier by the French directory, during a period of peace with Austria, displayed, upon their part, a correct knowledge of the cause which had at all times set bounds to the ambition of France, and at the same time evinced a determined spirit of hostility against the independence of the surrounding states.

Meanwhile the weakness of the French navy rendered it impossible for them to engage in any serious attack against the European part of the British empire. The French government, however, with the double view of attacking the rich empire which Britain had acquired in Asia, and of removing a successful military chief, whose ambition was already accounted dangerous, formed a de-

Reign of
George III.

Reign of George III. sign of sending Bonaparte, with an army, to seize upon and colonize Egypt. To accomplish this scheme with the greater safety, the threats of invading England were loudly renewed; the troops stationed on the coast were denominated the Army of England; and Bonaparte being now appointed their commander, visited them in person. But suddenly departing, he embarked at Toulon with a powerful army, before his intentions were suspected in Great Britain; Malta was surrendered to him on his passage; and departing thence, he landed in safety in the vicinity of Alexandria, and soon made himself master of all Egypt. Here, however, his successes terminated. He was closely pursued by a British fleet under Admiral Nelson; and the French admiral, Brueys, having remained at anchor near the shore in the Bay of Aboukir, afforded an opportunity for the British navy to earn one of its proudest and most decisive triumphs.

Why Bonaparte, having effected a landing in Egypt, should not have suffered the fleet to return, has never been explained. He accused Admiral Brueys, after that officer's death, of having lingered on the coast, contrary to orders; and the same charge is repeated in the memoirs which he transmitted from the place of his exile. But it is scarcely credible that any officer, situated as Brueys was, would have incurred the heavy responsibility which such disobedience incurs; and the more probable supposition therefore seems to be, that the fleet was detained by Bonaparte's orders. It arrived at Alexandria on the first of July; and Brueys, not being able to enter the port which time had ruined, moored his ships in Aboukir Bay, in a strong and compact line of battle; the headmost vessel being close to the shoal on the north-west of the bay, and the rest of the fleet forming a curve along the line of deep water, so as not to be turned by any means in the south-west. He had in fact made the best of his situation, and chosen the strongest position which he could possibly take in an open roadstead; so much so, indeed, that the commissary of the fleet thought they were moored in such a manner as to bid defiance to a force double their own. Besides, the advantage of numbers, in ships, guns, and men, was in favour of the French. They had thirteen ships of the line and four frigates, carrying eleven hundred and ninety-six guns, and eleven thousand two hundred and thirty men. The English had the same number of ships of the line, and one fifty-gun ship, the *Leander*, carrying only a thousand and twelve guns, and eight thousand and eighty-six men. The French had one three-decker of a hundred and twenty guns, and three eighty-gun ships; whilst the English ships were all seventy-fours. The moment Nelson perceived the position of the enemy, his intuitive genius suggested to him the decisive conception, that where there was room for a French ship to swing, there was room for an English ship to anchor; and the plan he accordingly adopted was to keep entirely on the exterior side of the French, and station his ships, as far as he was able, one on the outer bow, and another on the outer quarter of each of the enemy's, thus doubling on them in the way which had been projected by Lord Howe when he intended to attack the French fleet at their anchorage in *Gourjean road*.

As the British squadron advanced the enemy opened a fire from the starboard side of their whole line into the bows of the leading ships. It was received in silence and with stern composure; whilst the men on board of every ship were employed aloft in furling the sails, and below in tending the braces, and making ready for anchoring. Captain Foley led the way in the *Goliath*, outsailing the *Zealous*, which for some minutes disputed the post of honour with him; and intending to fix himself on the inner bow of the *Guerrier*, kept as near the edge of the

shoal as the depth of water would admit; but his anchor hung, and having opened his fire, he drifted to the second ship, the *Conquérant*, before it was clear, then anchored by the stern inside of her, and in ten minutes shot away her masts. Captain Hood in the *Zealous* took the station which the *Goliath* intended to have occupied, and in twelve minutes totally disabled the *Guerrier*. The *Orion*, Sir James Saumarez, next passed to windward of the *Zealous*, discharging her larboard guns as long as they bore on the *Guerrier*; and running inside the *Goliath*, sunk a frigate which annoyed her, hauled round towards the French line, and anchoring inside between the fifth and sixth ships from the *Guerrier*, took her station on the larboard bow of the *Franklin* and the larboard quarter of the *Peuple Souverain*, receiving and returning the fire of both. The *Audacious*, Captain Gould, pouring in a heavy fire into the *Guerrier* and the *Conquérant*, fixed herself on the larboard bow of the latter, and, when that ship struck, passed on to the *Peuple Souverain*. The *Theseus*, Captain Millar, followed, and having brought down the *Guerrier's* main and mizzen masts, anchored inside the *Spartiate*, the third ship of the enemy's line. The sun was now nearly down; but Nelson's decisive manœuvre had already been completely executed in its most critical parts.

The *Vanguard*, bearing the admiral's flag, and leading his division, now anchored on the outside of the enemy's line, within half-pistol-shot of the *Spartiate*, and veering half a cable, instantly opened a tremendous fire, under cover of which the *Minotaur*, *Bellerophon*, *Defence*, and *Majestic*, passed ahead to occupy their several stations. On this side the French were completely prepared; and in a few minutes every man stationed at the first six guns in the fore part of the *Vanguard's* deck was either killed or wounded. The *Minotaur* anchored next ahead of the *Vanguard*, and took off the fire of the *Aquilon*, the fourth in the enemy's line. The *Bellerophon* passed ahead and anchored by the stern on the starboard bow of the *Orient* of a hundred and twenty guns, Brueys' own ship, and the seventh in the line, "whose difference of force was in proportion of more than seven to three, and whose weight of ball from the lower deck alone exceeded that from the whole broadside of the *Bellerophon*." The *Defence* took her station ahead of the *Minotaur*, and engaged the enemy's sixth ship, the *Franklin*, by which judicious proceeding the British line remained unbroken. The *Majestic* having got entangled with the main rigging of one of the French ships astern of the *Orient*, suffered severely from the heavy fire of that three-decker; but she at length swung clear, and engaging the *Heureux*, or ninth ship, on the starboard bow, received also the fire of the *Tonnant*, which was the eighth in their line. The remaining four ships of the British squadron, having been detached previous to the discovery of the French, were at a considerable distance when the action commenced, which was at half past six; and as night closed about seven, they had no other light to guide them in going into action than the fire of the contending fleets.

Trowbridge in the *Culloden*, the foremost of the remaining ships, being two leagues astern, came on sounding as the others had done; but as he advanced the darkness increased the difficulty of the navigation; and suddenly, after having found eleven fathoms water, and before the lead could be hove again, he was fast aground; nor could all exertions get off the ship in time to bear a part in the action. This accident, however, proved in some degree fortunate, since the *Culloden* served as a beacon to the *Alexander* and *Swiftsure*, which would otherwise have gone upon the reef, and thus enabled them to enter the bay and take their stations in the darkness. As the *Swiftsure* was bearing down she fell in with what at first

Reign of George III.

Reign of
George III.

seemed to be a strange sail, but proved to be the *Belle-rophon*, which, overpowered by the *Orient*, was now drifting out of the line towards the lee side of the bay, with her sails hanging loose, her lights knocked overboard, nearly two hundred of her crew killed or wounded, and all her masts and cables shot away. Suspecting how it was, Captain Hallowell, with great judgment, abstained from firing; and occupying with the *Swiftsure* the station of the disabled ship, he opened a heavy fire on the quarter of the *Franklin* and the bows of the French admiral; whilst Captain Ball, in the *Alexander*, passed under the stern of the *Orient*, and anchoring within side on her larboard quarter, raked her, at the same time keeping up a severe fire of musketry on her decks. Lastly, the *Leander*, finding nothing could be done to get off the *Culloden*, advanced with the intention of anchoring athwart hawse of the *Orient*; but the *Franklin* being so near ahead that there was not room for him to pass clear of the two, he took his station athwart hawse of the latter.

This description will serve to convey an accurate idea both of the plan of attack and of the mode in which it was carried into execution. Though fiercely contested and sanguinary, the issue of the battle was never for an instant doubtful. The first two ships of the French line had been dismasted within a quarter of an hour after the commencement of the action, and the others had suffered so severely that victory was already certain. At half past eight o'clock the third, fourth, and fifth, were taken possession of; and about nine a fire broke out in the *Orient*, which soon mastered the ship, illuminating the contending fleets with the light of the conflagration. About ten o'clock the ship blew up with an explosion so tremendous that the firing immediately ceased on both sides, and for a time no sound was heard to break this awful pause, except the dash of her shattered yards, masts, and timbers falling into the water from the great height to which they had been projected. The firing recommenced with the ships to the leeward of the centre; and at daybreak the *Guillaume Tell* and the *Généreux*, the two rear ships of the enemy, formed the only portion of their line which had colours flying. Not having been engaged, these ships cut their cables in the forenoon and stood out to sea, accompanied by two frigates, being the only portion of the enemy's fleet which escaped. It is needless to add that the victory was complete. Of thirteen sail of the line, nine were taken and two burnt; and of four frigates one was burnt and another sunk. The British loss in killed and wounded amounted to eight hundred and ninety-five; while of the French three thousand one hundred and five, including the wounded, were sent on shore by cartel, and five thousand two hundred and twenty-five perished. About two hours after the commencement of the action, Nelson received a severe wound on the head from a piece of langridge shot; and Captain Westcott of the *Majestic* fell. Brueys was killed before the fire broke out which destroyed his noble vessel. He had received three wounds, yet would not leave his post; but a fourth cut him almost in twain, and he died like a hero on the deck. From the description of this battle, or rather naval conquest, it must be obvious that its triumphant success was owing to a skilful repetition, with necessary variations, of the manœuvre which had decided the victory at Camperdown; and in fact Nelson, although not acquainted with Lord Duncan, wrote to him, soon after the battle, to tell his lordship how "he had profited by his example."¹

From the time of the battle of Actium, by which the so-

vereignty of the Roman empire was decided, no naval victory was ever attended with consequences so immediately and obviously important as this. The French directory had concealed their intended enterprise from the Ottoman Porte, which lays claim to the sovereignty of Egypt, but has never been able to make its claim fully effectual. The grand signior, however, considered the present attempt as an act of hostility against himself; and the maritime victory above mentioned encouraged him to declare war, in the name of all true Mahomedan believers, against that host of infidels which had invaded the land from which the sacred territory of Mecca is supplied with bread. In Europe similar consequences took place. The irresistible career of Bonaparte had compelled Austria to submit to peace, upon terms which left France in a state of most dangerous aggrandizement. But as this victorious chief, with the best part of his veteran army, was now held under blockade by the British fleet in a distant country, the hopes of Austria began to revive, and there seemed reason to expect, that by renewing the contest, her ancient rank in Europe might be recovered. The king of Naples entered into these views with great eagerness, and rashly declared war against France, without waiting for, and following, as he ought, the movements of the greater powers. The empress of Russia was now dead, and her son Paul had succeeded to the throne of the Czars. The empress had never contributed more than her good wishes towards the war which the other powers of Europe had waged against France; but her son, a man of a furious and passionate character, had not the sense to follow the same cautious policy, or to remain a quiet spectator of the issue of a contest against the French republic; and, encouraged by the naval victory of the Nile, which seemed to insure the absence of Bonaparte and his army, he declared his willingness, as far as his finances would permit, to join in a new combination against France.

Thus, by the victory of the Nile, Great Britain was enabled to procure allies, willing to send abundance of troops against her enemy, provided she consented to defray the necessary expense. In the mean time, the acquisitions and losses of Britain were nearly equally balanced in other quarters. An armament sailed towards the island of Minorca, and a descent was effected near the creek of Ad-daya. Here a body of Spaniards threatened to surround the first division of the invading army; but they were soon repulsed, and our troops gained a position from which they might have attacked the enemy with advantage, if the latter had not retired in the evening. The army seized the post of Mescadal, and a detachment took the town of Mahon and Fort Charles. It was expected that the principal stand would have been made at Civadella, where new works had been added to the old fortifications; but the approach of the English drove the Spaniards within the walls of the town, and General Stewart summoned the governor to surrender it without delay. Intimidated by the movements of the troops and the appearance of the squadron, the garrison capitulated, and thus the whole island was reduced without the loss of a single man. But towards the end of the same year, the British troops, which during a considerable length of time had occupied a great number of positions upon the coast of the island of St Domingo, found it necessary to abandon the whole. The power of the French government there had nearly been annihilated by a negro commander, Toussaint-Louverture, to whom the British surrendered Port-au-Prince and St Marc. The losses incurred in consequence of the un-

¹ Ekins' *Naval Battles*, pp. 234, 237. Southey's *Life of Nelson*, vol. i. p. 220 et seqq. We beg here, once for all, to acknowledge our obligations to this admirable and authentic biography for the principal materials of our condensed accounts of the battle off Cape St Vincent, the attack on Copenhagen, and the mighty crowning achievement of Trafalgar.

of fortunate attempt made by the British government to subjugate this island were immense.

Parliament assembled on the 20th of November; and in the speech from the throne it was observed, that the success which had attended our arms during the course of the present year had been productive of the happiest consequences, and promoted the prosperity of the country; that our naval triumphs had received fresh splendour from the memorable action in which Lord Nelson had attacked a superior enemy, and turned an extravagant enterprise to the confusion of its authors; that the magnanimity of the emperor of Russia and the vigour of the Ottoman Porte had shown that these powers were impressed with a just sense of the present crisis; that their example would be an encouragement to other states to adopt that line of conduct which was alone consistent with security and honour; that our preparations at home had deterred the enemy from attempting to invade our coasts; that in Ireland the rebellion had been suppressed; that under the pressure of protracted war, the produce of the public revenue had been fully adequate to the increase of our permanent expenditure; that the national credit had been improved, and commerce flourished in a degree formerly unknown. The debates which occurred in the House of Commons upon this occasion were not remarkably interesting, as the leading members of the old opposition were usually absent. Administration was chiefly opposed by Mr Tierney, Sir Francis Burdett, Sir John Sinclair, and Sir William Pulteney. In the House of Lords, Earl Darnley moved the usual address to the throne, which was seconded by Lord Craven.

As a prospect had now opened of reviving, upon a most extensive scale, the continental war against France, it became necessary to provide great pecuniary resources to subsidize the armies which were to be brought forward, especially by the Russians, the poverty of whose country could ill afford to sustain the expense of supporting armies in Italy or on the banks of the Rhine. The same difficulties, or rather doubts, however, concerning the prudence of carrying to its utmost length the British practice of borrowing money to defray the extraordinary expense incurred during each year of the war, which had led to an augmentation of what are called the assessed taxes, still induced the minister to attempt to raise a proportion of the extraordinary or war expenditure within the year, not by a loan, but by taxes to the requisite amount. With this view he brought forward what was accounted a very bold measure, namely, a project for imposing a general tax upon the income of every individual throughout the nation. Mr Pitt stated in the House of Commons his plan to be, that no one whose income was less than sixty pounds per annum should be obliged to contribute more than the taxes he already paid; but that every one who had an income of or beyond that amount should be additionally burdened, some in the proportion of ten per cent. and others at a lower rate. All who had two hundred pounds a year would be required to sign a declaration of their willingness to pay a certain sum, not less than a tenth part of their income, without particularizing the modes in which it accrued; and a scale of easy computation would be adjusted for the rest. If doubts of the fairness of the statement should arise, the commissioners might summon an individual before them, and demand upon oath a minute specification of his income; and if, on a continuance of suspicion, full proof of accuracy should not be adduced, they might fix the amount of contribution. If they should require more than a tenth, no relief would be allowed unless the books of the tradesmen, or the ordinary accounts kept by others, should be submitted to inspection. Having stated the outlines of his plan, Mr Pitt mentioned the data upon which he formed

an estimate of its produce. He was of opinion that the annual rent of all the land in England and Wales amounted to twenty-five millions of pounds sterling; a sum which, by the allowance of a fifth part for the exceptions under sixty pounds, and the modifications under two hundred pounds a-year, would be reduced to twenty millions. Six millions, he thought, might be assumed as the clear income of the land to tenants, the tithes might be valued at four millions, the produce of mines, canals, and the like, at three, the rents of houses at five, and the profits of the liberal professions at two; on all these heads it might be sufficient to allow an eighth part for Scotland, which would be five millions. Income drawn from possessions beyond seas might be stated at five millions; annuities from the public funds at twelve; and those of internal trade, mechanical skill, and industry, at twenty-eight millions. These calculations formed an aggregate of a hundred and two millions; and from this source about ten millions of supply were expected to arise. This measure was opposed, without success, by Mr Tierney, Sir John Sinclair, Mr Pulteney, and others. Its chief defects were its inequality in point of principle, and the falsehood it occasioned with a view to evade it when carried into practice. Its inequality in point of principle is extremely obvious; because, under the tax upon income, a man without capital who earned two hundred pounds per annum by his industry, paid the same tax to government with a man living in idleness and enjoying a revenue of the same amount upon a land estate. In its collection this tax presented to merchants, and all other persons whose income depends upon their own industry, a powerful temptation to represent the amount of the latter as extremely low. It was expected, indeed, that the vanity of appearing wealthy and prosperous would counteract this tendency; but it was soon found that, in a commercial community, the love of gain is not easily subdued by any other passion; and as a general understanding soon prevailed among men with regard to each other's feelings upon this subject, nobody regarded his neighbour as unprosperous, merely because he had reported his own income to government at a low rate.

The fear of a French invasion had in a former age induced the English nation so far to overcome their own prejudices as to consent to an incorporating union with Scotland. The rebellion in Ireland, together with the dread that by means of French aid Ireland might be dismembered from the British empire, as the American colonies had been, now produced a sense of the necessity of doing that which ought to have been done three centuries before this date; that is, of uniting Ireland to Britain, by incorporating into one the heretofore distinct legislatures of the two islands. The measure was at this period very practicable, because Ireland was in fact under the dominion of forty thousand troops, who had been collected to crush the rebellion, and protect the island against the French; and because the friends of government were too much intimidated by the confusion and the scenes of bloodshed which had recently occurred there, to venture to oppose vigorously a measure which promised for the future to preserve the tranquillity of the country inviolate. On the 31st of January Mr Pitt proposed the measure in the British House of Commons. He observed, that a permanent connection between Britain and Ireland was essential to the true interests of both countries; and that, unless the existing connection should be improved, there was great risk of a separation. The settlement of the year 1782 was so imperfect, that it substituted nothing for that system which it demolished; and it was not considered as final even by the ministers of the time. It left the two realms with independent legislatures, connected only by the identity of the executive power; a very insufficient

Reign of
George III.

Reign of
George III.

tie, either in time of peace or of war, and inadequate to the consolidation of strength, or the mutual participation of political and commercial benefits. The case of the regency exhibited a striking instance of the weakness of the connection; and if the two parliaments had differed on the subject of the war, the danger of a disjunction would have been seriously alarming. The entire dissociation of the kingdom was one of the greatest aims of our enemies; and as their eventual success in Ireland would expose Britain to extreme peril, the establishment of an incorporative union, by which their views might be effectually baffled, was a necessary act of policy. Among the advantages which would accrue to Ireland from an incorporation with Britain, he mentioned the protection which she would secure to herself in the hour of danger; the most effectual means of increasing her commerce and improving her agriculture; the command of English capital, and the infusion of English manners and English industry, necessarily tending to meliorate her condition; whilst she would see the avenue to honours, distinctions, and exalted situations in the general seat of empire, opened to all those whose abilities and talents enabled them to indulge an honourable and laudable ambition. The question was not what Ireland would gain, but what she would preserve; not merely how she might best improve her situation, but how she might avert a pressing and immediate danger. In this point of view her gain would be the preservation of all the blessings arising from the British constitution. As the supposed loss of national independence formed, in the minds of many, a strong objection to the scheme, he argued that this would be a real benefit; that the Irish would rather gain than lose in point of political freedom and civil happiness; and that though a nation possessing all the means of dignity and prosperity might justly object to an association with a more numerous people, Ireland, being deficient in the means of protection and civil welfare, could not be injured or degraded by such a union with a neighbouring and kindred state as would connect both realms by an equality of law and an identity of interest. Mr Sheridan opposed a union, as particularly unseasonable, amidst the irritation which at this period prevailed in Ireland; and he deprecated the accomplishment of the object by means of force or corruption. The measure, however, was approved of by a very large majority; and in the House of Lords the same subject was afterwards discussed with a similar result. But in the Irish parliament the proposal was resisted with such vehemence, that administration, finding themselves supported only by a small majority, thought fit to avoid pressing the matter further at this time.

During the present year the British power in India was greatly augmented, and its territory extended, by the fall of Tippoo Sultan, the son and successor of Hyder Ali. From the time when this prince had been compelled by Lord Cornwallis, in 1792, to surrender one half of his dominions, it was understood that sooner or later he would make an attempt to recover what he had lost. It would even seem that he had entertained hopes of aid from the French, and that with this view he had privately sent envoys to the Isle of France, to attempt to form a connection with the present French rulers. But when intelligence reached India of the expedition to Egypt, and the victory of the Nile, the British governor-general demanded from Tippoo Sultan an explanation of his views; and after some fruitless negotiation, a British army under General Harris invaded the territory of Mysore, which they found in a bad state of preparation for war. After some slight encounters the British army encamped before Seringapatam on the 6th of April; but it was not till the 2d of May that the besieging batteries began to breach the wall. On the

4th, during the heat of the day, the place was stormed, and Tippoo himself perished fighting gallantly at one of the gates of the fortress. His dominions were seized by the British, who bestowed a portion of them upon the Mah-rattas and the nizam their ally; whilst part was reserved under the direct sovereignty of the East India Company, and the remainder nominally bestowed upon a prince of the family which had lost its power by Hyder's usurpation. The substantial authority over this last-mentioned portion of Tippoo's dominions, however, was in truth retained by the British government; and as the nizam himself soon became entirely dependent upon the British power, the whole peninsula of Hindustan, with the exception of the Mahratta states, which evidently could not long remain unsubdued, might now be considered as under the dominion of Great Britain.

In Europe the present campaign proved extremely eventful. The French directory had been more anxious to establish its own power at home, than careful to maintain the armies upon the frontiers and in the conquered countries in a proper state of force and efficiency. A French army under General Jourdan advanced into Suabia in the month of March, but was encountered and beaten at Stockach by the Archduke Charles. The importance of the possession of Switzerland instantly displayed itself. The vanquished French army immediately crossed the Rhine into Switzerland, and in that mountainous country contrived to make a stand during the greater part of the summer. The Austrians advanced as far as Zurich, of which they obtained possession; but before they could proceed further, the French armies, having been reinforced towards the end of the season, were enabled in their turn to assume the offensive.

In Italy the French manœuvred unskilfully at the opening of the campaign. Instead of concentrating their forces, they attempted to retain possession of the whole of that country, and were thus beaten in various engagements at different points. The combined Austrian and Russian army was commanded by the Russian general Suwarof, who pressed upon the French with incredible activity and energy; carrying on a multiplicity of sieges, and bringing his troops together with wonderful celerity, whenever his enemy attempted to take advantage of the manner in which his forces were scattered. Macdonald, with the Neapolitan army, was defeated on the Trebbia; Moreau, who succeeded Joubert, killed at the commencement of the battle, was beaten at Novi; and in a number of combats of less magnitude the Austro-Russian army proved almost uniformly successful. The result of the whole was, that before the campaign terminated, Suwarof had driven the French out of Italy, with the exception of Savoy and the Genoese territory. But this was not accomplished without a great loss of men in sieges and battles, in which the hardy warriors of the north suffered very severely. Their leaders depended for success more upon the intrepidity of their troops, and the promptitude with which they rushed into action, than upon the skilful dispositions with which they arranged their force or harassed their enemy. Hence it happened that, amidst all Suwarof's victories, no instance occurred of any column of French troops being compelled to surrender without fighting, nor was any advantage gained but by the efforts of superior force exerted in open battle. Such a warfare, carried on against a single enemy by a combined army, could not long be successful. The Austrian officers complained loudly of their northern allies as men destitute of military skill, who wasted armies without a proportional return of conquest; whilst, on the other hand, the Russians censured their associates as destitute of proper spirit, and as protracting the war by an ill-timed caution.

The advantage derived by the French from the possession of Switzerland having by this time begun to be understood, a resolution was in consequence formed to close the campaign, not by sending Suwarof from Italy into the south of France, but by directing him to turn his arms northward against the Alps. The Archduke Charles had spent the summer in pressing upon the French in that quarter, but had not been able to advance beyond Zurich; here, however, he left a considerable body of Austrians and Russians, and proceeded with a division of his army towards Mannheim and Philipsburg. Suwarof advanced from Italy at the head of eighteen thousand men to take the command of these troops; but his views were anticipated by the French general Massena, who, finding the Archduke Charles and Suwarof at the distance of more than a day's march on his left and right, instantly attacked the troops stationed near Zurich. The Austrians perceiving the hazardous nature of their situation, retreated with only a moderate loss; but the Russians, from an ill-judged contempt of their enemy, total ignorance of the country, and want of skill in the art of conducting war in it, maintained their ground till they were hemmed in on all sides. They attempted to resist the French, as they had often resisted the Turks, by forming a hollow square of great strength; but neither this nor their own courage afforded any safety against the artillery of the enemy, in the face of which an iron front of bayonets was presented in vain. Their order was at last broken, and their retreat converted into an utter rout. Suwarof was at the same instant advancing rapidly to their relief; but the victorious enemy now turned quickly upon him, and attempted to encompass him on all sides. By incredible exertions, however, and following paths which were believed to be utterly impracticable, he effected his escape with about five thousand of his troops, in want of every thing, and retaining only the muskets in their hands.

Thus terminated on the eastern side of France this active and brilliant campaign. The allies remained masters of Italy; but France was still enabled to menace that country, as well as Germany, by retaining possession of Switzerland. In the meanwhile the British attempted, with the aid of Russian auxiliaries, to drive the French out of Holland. On the 27th of August, a landing was effected under Sir Ralph Abercromby at the mouth of the Texel; and the Zuyder Zee was immediately entered by a British fleet under Admiral Mitchell. Upon this the Dutch admiral, Storey, surrendered the fleet under his command, alleging that his men refused to fight. The ships were twelve in number, and eight of them mounted from fifty-four to seventy-four guns. Here, however, the effectual success of the expedition terminated. The Duke of York afterwards assumed the command, and forces amounting to thirty-five thousand men were landed; but it was soon discovered that the invasion had been ill concerted and ill directed. To have afforded a prospect of success, the invading army should have been landed in the vicinity of Rotterdam, which was full of Scotsmen, and where the supporters of the stadtholder were numerous; and then advanced rapidly into the centre of the country, to encourage the numerous enemies of the French to come forward in favour of the invaders. Instead of this the army was disembarked at the extremity of a long and narrow neck of land, having the sea on both sides, where the French and Dutch were able to arrest their progress for a considerable time with a mere handful of troops. The unusual wetness of the season, which greatly injured the roads, also added to the difficulties with which the invaders had to struggle; and the British commander was at length under the necessity of withdrawing his troops to the point at which they had originally disembarked. Here a convention was entered into,

by which it was stipulated on the one hand that he should not injure the country, and that a number of French prisoners in England should be released; whilst, on the other hand, it was agreed that the Duke of York should be permitted to retire unmolested.

At the end of this campaign the French government underwent a new change. After the conquest of Egypt Bonaparte had invaded Syria, and subdued or conciliated most of the native tribes; but his career of victory was stopped at St Jean d'Acre by the Turkish governor of that town, assisted by the British under Sir Sidney Smith. He was forced to raise the siege of that place, after fifty-nine days of open trenches, and delivering five unsuccessful assaults; and having returned into Egypt, and destroyed a Turkish army at Aboukir, he ventured upon a step which is without example in the history of modern Europe. Having learned from an old newspaper the great reverses which the French armies had experienced in the early part of the campaign, and the general discontent produced by these misfortunes, he resolved to trust to fortune and return to France. With this view he secretly embarked, along with a select party of friends, on board a small vessel, leaving the command of his army, which was now completely insulated in the country, to General Kleber, an officer of high reputation for military genius and enterprise; and after escaping a thousand perils he landed safely at Frejus, in the south-east of France. The unexpected arrival of an officer who had never fought in Europe without success was welcomed by the public at large as a happy event; and in the first moment of joy little inquiry was made as to the manner in which he had abandoned his army, an act which in any other circumstances would have been regarded as one of the greatest of military crimes. Finding a party willing to second his views, Bonaparte now took advantage of the satisfaction occasioned by his arrival, together with the discontents arising from the corruption and mismanagement of the directorial administration, to usurp the government, cashier the directory, and to dissolve the representative legislature.

The British parliament was assembled as early as the 24th of September, in order to provide for an augmentation of force, which was thought necessary to give effect to the invasion of Holland, an enterprise of the success of which sanguine hopes were at that time entertained. The speech from the throne, after recommending the propriety of permitting to a considerable extent the voluntary service of the militia, in order to augment our forces abroad, stated that our prospects had been improved beyond the most sanguine expectation; that the deliverance of Italy might now be considered as secured; that the kingdom of Naples had been rescued from the French yoke, and restored to the dominion of its lawful sovereign; that the French expedition to Egypt had been productive of nothing but calamity and disgrace, whilst its ultimate views against our eastern possessions had been utterly confounded; that there was every reason to expect a successful result from our efforts for the deliverance of the United Provinces; and that to our ally the emperor of Russia we were in a great measure indebted for the favourable change in the general posture of affairs. It was further stated that, in pursuance of the recommendation of the British parliament, his majesty had communicated to both houses of parliament in Ireland their sentiments respecting a union with that kingdom.

In consequence of the recommendation from the throne, an act was passed, authorizing his majesty to receive into the army volunteers from the militia regiments, and some measures of finance were adopted; but government having received intelligence of the failure of the expedition against Holland, parliament was suddenly adjourned. In

Reign of George III. the meanwhile affairs on the Continent began to assume a most unpropitious aspect. The emperor of Russia, being exasperated at the defeats sustained by his troops towards the close of the campaign, became dissatisfied with his allies; and there was reason to dread that his irascible and unreasonable temper might lead him not merely to desert but to quarrel with them. In the meanwhile Bonaparte, under the title he had assumed of First Consul of the French Republic, resolved to signalize his acquisition of power by an attempt to procure peace. With this view he thought proper to address a letter, signed by himself, to the king of Great Britain. In this document, after announcing his own appointment to the office of first magistrate of the republic, he asked, "Is the war which for eight years has ravaged the four quarters of the world to be eternal? Are there no means of coming to an understanding? How can the most enlightened nations of Europe, powerful and strong beyond what their safety and independence require, sacrifice to ideas of vain grandeur, commerce, prosperity, and peace? How is it that they do not feel that peace is of the first importance, as well as the highest glory?" "France and England," he added, "by the abuse of their strength, may still for a long time, for the misfortune of all nations, retard the period of their being exhausted; but, I will venture to say it, the fate of all civilized nations is attached to the termination of a war which involves the whole world." This letter was transmitted through the medium of an agent of the French government, who resided at London for the sake of managing the exchanges and other affairs relative to prisoners of war.

But Lord Grenville, as secretary of state for foreign affairs, informed the agent who had transmitted Bonaparte's letter, that his majesty could not depart from the usual forms of transacting business, and therefore, that the only answer to be returned would be an official note from himself. In this note his lordship stated that the king wished for nothing more than to restore tranquillity to Europe; that he had only made war in defence of his people, against an unprovoked attack; and that it would be in vain to negotiate while the same system continued to prevail in France which had ravaged Holland, Switzerland, Germany, and Italy. "While such a system therefore prevails," continued his lordship, "and while the blood and treasures of a powerful nation can be lavished in its support, experience has shown, that no defence but that of open and steady hostility can be availing. The most solemn treaties have only prepared the way to fresh aggression; and it is by determined resistance alone, that whatever remains in Europe of stability for property, for personal safety, for social order, or the exercise of religion, can be preserved. For the security, therefore, of these essential objects, his majesty cannot place reliance on the mere renewal of general professions of pacific dispositions. Such professions have been repeatedly held out by all who have successively directed the resources of France to the destruction of Europe, and whom the present rulers have declared all to have been incapable of maintaining the relations of amity. Greatly will his majesty rejoice whenever it shall appear, that the danger to which his own dominions and those of his allies have been so long exposed has really ceased; whenever he shall be satisfied that the necessity of resistance shall be at an end, and, after so many years of crimes and miseries, better principles have prevailed, and the gigantic projects of ambition, endangering the very existence of civil society, have at length been relinquished. But the conviction of such a change can result only from the evidence of facts." His lordship then went on to say, with insulting irony, that the best pledge of the reality and permanence of such a change would be the

Reign of George III. restoration of the princes of the house of Bourbon; that such an event would at once remove all obstacles in the way of negociation, confirm to France the unmolested enjoyment of its ancient territory, and give tranquillity to other nations; that, however, his majesty did not limit the possibility of solid pacification to this mode, and made no claim to prescribe to France what should be the form of her government; that he only looked to the security of his own dominions, of his allies, and of Europe; that unhappily at present no such security existed, nor any sufficient evidence of the principles by which the new government would be directed, or even of its stability; and that in this situation, it remained for him to pursue, in conjunction with other powers, the exertions of a just and defensive war.

As one of the principal objects on account of which Bonaparte had commenced this negociation was probably to cast upon Great Britain the odium of continuing the war, he persevered in this purpose with uncommon dexterity. Appearing not to be disconcerted by the first rejection of his offers, he continued the correspondence through the medium of Talleyrand, his minister for foreign affairs, who, in a masterly note in answer to that of Lord Grenville, dissected the official communication of the British minister with consummate ability, and refuted the various statements and views which it embodied. He began with recriminating respecting the origin of the war, and presented a picture very differently sketched and coloured from that which Lord Grenville had portrayed in his letter. The charge of aggression brought against the French nation was haughtily repelled, and retorted on the coalesced powers, particularly on the British government. After expatiating on this subject, the French minister observed, that a sincere desire for peace ought to lead the parties to the discovery of the means of terminating the war, rather than to apologies or recriminations respecting its commencement; that no doubt could be entertained of the right of the French nation to choose its own government; that this was a point which could not be decently contested by the minister of a crown which was held on no other tenure; that at a time when the republic presented neither the solidity nor the force which it now possessed, negotiations had been twice solicited by the British cabinet, and carried into effect; that the reasons for discontinuing the war were become if possible more urgent; that, on the contrary, the calamities into which the renewal of the war must infallibly plunge the whole of Europe, were motives which had induced the first consul to propose a suspension of arms which might likewise influence the other belligerent powers;—and he concluded with pressing this object so far as to propose the town of Dunkirk, or any other, for the meeting of plenipotentiaries, in order to accelerate the re-establishment of peace and amity between the French republic and Great Britain. In the answer of the British minister to this note, the recrimination of aggression was as contemptuously repelled as it had been haughtily urged. Referring to his former note, Lord Grenville observed, that the obstacles which had been presented rendered hopeless for the moment any advantages which might be expected from a negociation; that all the representations made with so much confidence by the French minister, the personal dispositions of those in power, the solidity and consistence of the new government, were points which could not be admitted as motives for opening a negociation, since these considerations remained yet to be proved; and that the only evidence must be that already explained by his majesty, namely, the result of experience and the evidence of facts.

On the 22d of January copies of this correspondence were presented to the British parliament, along with a message from his majesty, announcing that he relied on the

Rei of support of his parliament, and the zeal and perseverance of
Geor III. his subjects, in carrying into effect such measures as would
best confirm the signal advantages obtained in the last cam-
paign, and conduct the contest to an honourable conclusion.
On the 28th of the same month the subject was discussed
in the House of Lords upon a motion made by Lord Gren-
ville for an address of thanks to his majesty in consequence
of the message. Lord Grenville contended, that nothing
in the state of Europe admitted a rational hope that there
was any security but in war; and that peace with a na-
tion at enmity with order, religion, and morality, would
rather be an acquiescence in wrong than a suspension of
arms in ordinary warfare. He entered into a comment
upon the note of the French minister, and disputed all its
positions, observing that the love of peace, on the part of
France, had been displayed in a war of eight years with
every nation in Europe excepting Sweden and Denmark;
that her disinclination to conquest had been evinced by
the invasion of the Netherlands, of Italy, of Switzerland,
and even of Asia; that no honourable or permanent peace
could be made with the present rulers of France; and
that every power with which she had treated could furnish
melancholy instances of the perfidy, injustice, and cruelty
of the republic. He remarked, that General Bonaparte,
in the third year of the republic, imposed upon the French,
at the mouth of the cannon, that very constitution which
he had now destroyed at the point of the bayonet. If a
treaty was concluded and broken with Sardinia, it was con-
cluded and broken by Bonaparte; if peace was establish-
ed and violated with Tuscany, it was established and vio-
lated by Bonaparte; if armistices were ratified and an-
nulled with Modena and the other petty states of Italy,
they were ratified and annulled by Bonaparte; if that
ancient republic Venice was first drawn into a war, and
compelled afterwards to conclude a treaty, it was that
Bonaparte might more easily overthrow her constitution,
and annihilate the political system by which she had ex-
isted with glory and security for ages past; if the govern-
ment of Rome was subverted, it was subverted by Bona-
parte; if Genoa was reduced to the same humiliating situ-
ation, her wealth and independence were sacrificed to Bona-
parte; if Switzerland, deluded by offers of peace, was
induced to surrender her rights and liberties, she was
deprived of them by Bonaparte. He had multiplied vio-
lations of all moral and religious ties; he had repeated
acts of perfidy; his hypocrisies were innumerable; and in
that country where he had affirmed that the French were
true Moslems, he had given us a correct idea of his sin-
cerity and his principles. If the interest of Bonaparte were
deeply concerned, he might be sincere, and there was no
doubt but it was his interest to consolidate his power;
but it ought not to be forgotten, that whenever any acts
of atrocity were to be accomplished by the French, they
had been usually effected by a suspension of arms. The
proposed negotiation would relieve her from the actual
pressure of alarming difficulties, but could not relieve Eng-
land from any. The ports of France, which were now
blockaded by our fleet and cruisers, would be thrown open
to introduce naval stores, and a variety of necessary ar-
ticles, of which the country was in want; and fleets would be
sent to bring back the troops which were now deprived of
all intercourse with the republic, and which might then
be employed in augmenting the numbers of the French
armies. To us a suspension of arms could not be produc-
tive of any benefit whatever; our ports were not blocked
up, our commerce was not interrupted; and it should
also be considered that there would be no security for the
maintenance of such a suspension. Was Bonaparte now
prepared to sign a general peace? If he were not, he could
not be sincere in his offers. It was necessary for him to

keep an army of sixty thousand men to preserve tranqui-
lity in the interior of France; every act of his government
was supported by force; and if he even were sincere, it
was hazarding too much to hazard all on his single life.
What reliance could be placed on the unanimity of the
French people? Men of the blackest characters had been
appointed to situations of the greatest trust; men infam-
ous for professed principles of anarchy had been raised
to places of confidence and power; and those who were
judges in the sanguinary tribunals of Robespierre were
now exalted to a distinguished rank in the republic. His
lordship concluded by disclaiming on the part of admini-
stration any wish to consider the restoration of the French
monarchy as the object of the war.

The Duke of Bedford opposed the noble secretary's mo-
tion, and contended, that all the objections against negoti-
ation might have been urged against the negotiations which
the ministers themselves had formerly opened at Lisle.
He considered the conduct of the British government on
the present occasion as unwise, because provoking and
unconciliatory. He thought that, in a correspondence
with the present French government, all discussion about
the original commencement of the war ought to have been
avoided. Whether England or France was the first ag-
gressor, was a question to be reserved to posterity. The
wild scheme of restoring the French monarchy was the
sine qua non, if not of peace, at least of negotiation; for
notwithstanding that the noble secretary had denied the
charge, yet whilst he pointed out the impossibility of treat-
ing with the French government during all its stages to
the present, and insisted upon vigorous hostilities being
the only means of our security, no inference could be drawn,
but that the war must be continued till monarchy was re-
established. If the restoration of monarchy was not the
object, what was it? Were ministers contending that we
ought to wait for a more favourable opportunity of enter-
ing into negotiation? Was it to be obtained by railing
at Bonaparte? There were no terms sufficiently strong to
censure the littleness which attacked his character, in
order to ruin him in the estimation of the French nation;
as if by so doing, we could negotiate with more effect, or
gain a fairer prospect of peace. His grace contended that
no confidence was to be reposed in our present continen-
tal allies; and as a severe scarcity at this period prevail-
ed in the country, this circumstance was made use of as
an additional argument against persevering in the war.
The first consul, doubtless, sought to make a peace ad-
vantageous to himself and the nation over which he pre-
sided: like all other statesmen, his motives might not be
influenced by humanity: it was to be supposed his aim
would be to satisfy the French people, and consolidate
his own power. As to the abuse which ministers threw
upon his character, it was their constant habit to abuse
every ruling power in France. But whenever they had
been driven by the voice of the people to negotiate, their
former ill language had never been any impediment. The
duke concluded with a motion for an address recommend-
ing a negotiation for peace.

Lord Borington supported the views of ministers. But
Lord Holland reprobated their conduct throughout the
contest. At one time they asserted that the ambition
of France was so insatiable, that she would listen to no
terms; they were now driven from that pretext, and urged
that a peace would be insecure. As to the ambition of
the enemy, it was a consideration of weight in the arrange-
ment of terms, not a preliminary objection preclusive of
treaty. What proof could be given of the abandonment
of dangerous views, but a negotiation in which moderation
would be displayed. Was it reasonable to suppose that
he would admit that the guilt of the aggression lay with

Reign of
George III.

France? This was a point which ought not to have been discussed. The object was to treat upon actual circumstances and the real grounds of dispute. Suppose that Bonaparte, desirous to attain peace by any means, should sit down to consider how he could succeed; what does the note allow him to do? He would find that the restoration of the hereditary line of kings was the only case in which a speedy peace would be admitted as possible; in fact, therefore, this restoration was the *sine qua non* in which immediate negotiation was admissible with ministers. But surely if the ambition of the republic was so formidable, we could not forget this ground of apprehension when we talked of restoring the house of Bourbon. Had we forgotten their proverbial ambition, and was their restoration the remedy for evils arising from such a source? We had now taken up the principle, so much objected to by Jacobins, of distinguishing between the people and their government. But what was the conduct of the French? Bonaparte distinctly renounced this principle in the letter to the king, and acknowledged the title and the character of his majesty's government. The note of our ministers was a manifesto to the royalists, and formed for that purpose alone. Lord Holland further stated, that the people at large disapproved of the abrupt rejection of Bonaparte's overtures; he therefore gave his most decided support to the amendment. The Earl of Carnarvon would not consider the answer of our ministers as a refusal to treat for peace, or a declaration of eternal war; it was a call upon the house and the country to pause before they rashly suffered themselves to enter into a negotiation with an unsettled government. He did not expect any extraordinary faith to be manifested by Bonaparte, more than by any other chief or chiefs; but although he would be best pleased with the restoration of monarchy in France, in all times, in monarchies as well as republics, aristocracies, and every other species of government, good faith in treaties was preserved and exemplified only as long as it was the interest of the parties to maintain it. So little integrity had history left on record, that, at the very time they were signed, a secret intention was often indulged to violate them at a particular period. The address, as moved by Lord Grenville, was then carried by a great majority.

In the House of Commons Mr Dundas moved a similar address, which gave rise to a similar debate. Mr Dundas said, that the leading feature of the French revolution was a disregard of all treaties, and a contempt for the rights of other powers; and in proof of this assertion, he considered it as necessary merely to recite the names of Spain, Naples, Sardinia, Tuscany, Genoa, Geneva, Modena, Austria, Russia, England, and Egypt, with Denmark and Sweden, though at all times neutral states. Britain had not at this time any reasonable cause to suppose that a change of principles had taken place. The Jacobinical form of government was indeed at an end; but in substance and essence all the qualities of the revolutionary government were in as full force at this moment as they were in the days of Robespierre. Mr Whitbread asserted, that, had it not been for the interference and ambition of the other powers of Europe, the French revolution would have assumed a very different character from that which it now exhibited. He remarked, that other powers had treated neutral states no less unjustly than had been done by the French; Lord Harvey and Lord Hood had ordered the French ministers to be dismissed from Florence; and by threats we had compelled Genoa to dismiss her French inhabitants. He compared Bonaparte with Suwarof, and the invasion of Egypt by France with that of Poland by Austria, Russia, and Prussia, whose friendship we had frequently courted. Mr Thomas Erskine entered at great length into the question, whether France or Great Britain

had been guilty of the original aggression in the war, and contended that the British government had engaged in it unnecessarily, and persisted in it without necessity. Mr Pitt, on the other hand, affirmed that the French leaders had themselves begun the war, on the principle that it was necessary to consolidate the revolution. With regard to the proposal to negotiate with their present leader, it was impossible to discuss fairly its propriety, without taking into consideration his personal character and conduct. Mr Pitt then expatiated on the conduct of Bonaparte at Campo Formio, in the Milanese, Genoa, Modena, Tuscany, Rome, Venice, Switzerland, and Egypt. His arts of perfidy, he said, were commensurate with the number of treaties; and if we traced the history of the men in this revolution whose conduct had been marked by the most atrocious cruelty, the name of Bonaparte would be found allied to more of them than that of any other within these ten eventful and disastrous years. From these facts the house might judge what reliance might reasonably be placed on this conqueror, and what degree of credit might be given to his professions. It had been observed, indeed, that whatever had been his character, he had now an interest in making and preserving peace. This was a doubtful proposition. That it was his interest to negotiate, would be readily acknowledged, and to negotiate with this country separately, in order to dissolve the whole system of the confederacy on the Continent; to paralyse at once the arms of Russia, of Austria, or of any other country which might look to us for support; and then either to break off his separate treaty, or, if he should have concluded it, to apply the lesson taught in his school of policy in Egypt, and to revive at his pleasure those claims of indemnification which may have been reserved to some happier period. Under all these circumstances of his personal character and his newly acquired power, what security had he for retaining that power but the sword? His hold upon France was the sword, and he had no other. But was the inference to be drawn from these considerations, that we ought in no case to treat with Bonaparte? No; but we ought to wait for the evidence of facts. At present there was nothing from which we could presage a favourable disposition in the French consuls. There was the greatest reason to rely on powerful co-operation from our allies; the strongest indication in the interior of France of a disposition to resist this new tyranny; and every ground to believe, that if we were disappointed of complete success, the continuance of the contest, instead of making our situation comparatively worse, would make it comparatively better. With regard to the negotiation at Lisle in 1797, to which allusions had been made, the Jacobin system of prodigality and bloodshed, by which the efforts of France had been supported, had at that period driven us to exertions which had exhausted the ordinary means of defraying our immense expenditure, and led many who were convinced of the necessity of the war to doubt the possibility of persisting in it. Under this impression we negotiated, not from the sanguine hope that its result would be permanent security, but from the persuasion that the danger arising from peace in these circumstances would be less than the continuance of war with inadequate means. Mr Fox was decidedly of opinion that France, at the commencement of the war, was the defending party. The aggressions of Austria and Prussia could not be denied by any impartial person; nothing could be more decidedly hostile than their proceedings; they scrupled not to declare to France that it was her internal concerns, not her outward actions, which provoked them to confederate against her; they did not pretend to fear her ambition, her conquests, her troubling her neighbours; but they accused her of new-modelling her own government. In all this he

Reign of
George III.

gn of was not seeking to justify the French, either in their internal or external policy. On the contrary, he thought their successive governments had been as execrable in various instances as any of the most despotic and unprincipled governments which the world had ever seen. Men bred in the school of the house of Bourbon, once engaged in foreign wars, would naturally endeavour to spread destruction, and form plans of aggrandisement, on every side; they could not have lived so long under their ancient masters without imbibing the insatiable ambition and restless spirit, the perfidy and the despotism, inherent in the race; they had imitated their great prototype, and through their whole career of crimes had done no more than trace the steps of their own Louis XIV. Are we for ever, continued Mr Fox, to deprive ourselves of the benefits of peace, because France has perpetrated acts of injustice? With the knowledge of these acts, we had treated with them twice, and ought not now to refuse to do so? Much had been said of the short-lived nature of military despotism; yet such was the government erected by Augustus Cæsar, which endured six hundred years. Indeed, it was too likely to be durable wherever it was established. Nor was it true that it depended on the life of the first usurper. Half of the Roman emperors were murdered, yet the tyranny continued; and this, it was to be feared, would be the case in France. On a division, however, the address was carried by a very large majority.

The great measure of a legislative union with Ireland was carried into effect during the present session of parliament. Administration had found it necessary to delay this matter in consequence of the opposition in the Irish parliament; but during the recess they had obtained a more ample majority; and as the British parliament had already, on Mr Pitt's motion, passed resolutions in favour of the union, the project was formally introduced to the Irish parliament on the 5th of February 1800, by a message from the lord-lieutenant, in which his excellency stated that he had it in command from his majesty to lay before the houses of legislature the resolutions of the British parliament, and to express his majesty's wish that they would take the same into their most serious consideration. After a long and spirited debate, the ministry prevailed by a majority of forty-three. The distinguished abilities of Mr Grattan were once more displayed on this interesting occasion. In the debate which took place on proposing the first article of the union, he opposed the measure with such vehemence, that the chancellor of the exchequer accused him of associating with traitors, and of disaffection to the government; but the reply of Mr Grattan was so pointed and severe, that the chancellor conceived himself under the necessity of resenting it by a challenge, and a meeting having taken place in consequence, he was wounded in the arm. The question, however, was carried by a considerable majority; and as the discussion proceeded, the numbers of opposition appeared to diminish. The last struggle, as it may be deemed, occurred on the 13th of March, when Sir John Parnell moved to petition his majesty to call a new parliament, in order that the sense of their constituents might be more fully ascertained; but this motion was also overruled. In the mean time the business proceeded with little opposition in the House of Lords, which, on the 24th of March, adopted the whole of the articles of union with few alterations; and soon afterwards both houses waited on his excellency with a joint address to this effect. No time was now lost in submitting the measure anew to the British parliament. On the 2d of April, a message from his majesty was presented to both houses of parliament, communicating the resolutions of the Irish parliament in favour of an incorporating union between the two kingdoms, and recommending the speedy

conclusion of a work so interesting to the security and prosperity of the British empire. In the House of Lords the measure was opposed by Lord Holland, on the ground that a union at this time was not the spontaneous offer of the parliament of Ireland, uninfluenced by corruption or menace; but the articles were afterwards carried in a committee of the house, after some debates of no great importance. In the House of Commons Mr Pitt stated that the principal act of the treaty, that which fixed the share of representation Ireland was to have in the united parliament, was founded upon a comparative statement of the population of both kingdoms, as well as the revenue of both. The number of members fixed for the counties and two principal cities was sixty-eight; and that for the most considerable cities, towns, and boroughs, was thirty-one, who would be selected without partiality. He next adverted to the arrangements respecting the House of Peers, and the members to be returned; and observed, that as the members for the Commons of Ireland were in number nearly double those of Scotland, the same rules would be observed with the peerage, which therefore was to consist of thirty-two members. It was also understood, that such peers of Ireland as might not be among the twenty-eight temporal peers, should be allowed to sit in the united parliament until elected. The only article consisting of minute details related to the apportionment of the shares of the revenue of each country respectively. Mr Grey opposed the union on nearly the same grounds as Lord Holland had done in the Upper House. It had been asserted in a speech of the lord-lieutenant to the Irish parliament, that five sevenths of the country, and all the principal commercial towns, except Dublin, had petitioned in favour of the union. But this only meant that nineteen counties had presented petitions, and that these counties constitute five sevenths of the surface of Ireland. He admitted the petitions in favour of the union; but by what means were they obtained? The lord-lieutenant, who, besides being the chief civil magistrate, is commander of a disciplined army of a hundred and seventy thousand men, and able to proclaim martial law when he pleases, procured these petitions, which were signed by few names, and those by no means the most respectable. But fortunately there were many petitions on the other side, not obtained by solicitation and at illegal meetings, but at public assemblies, of which legal notice had been given. Twenty-seven counties had petitioned against the measure; the petition from the county of Down was signed by seventeen thousand respectable, independent men; and all others were in a similar proportion. Mr Grey then adverted to some of the principal arguments of the unionists; and concluded by moving an address to his majesty for a suspension of all proceedings relative to the union, till the sentiments of the people of Ireland could be ascertained. Mr Sheridan represented the measure as an act of tyranny towards the people of Ireland, which must become the fatal source of new discontents and future rebellions. Mr Grey's motion was, however, rejected by an overwhelming majority.

Early in the session mention had been made by opposition of the unfortunate invasion of Holland by the British forces; but ministers declined entering upon the subject, as the expedition had been carried on under the superintendence of Mr Secretary Dundas, and that gentleman, soon after the meeting of parliament, had gone down to Scotland in the depth of winter, without any ostensible business; a circumstance which gave rise to suspicions that some dissatisfaction existed at court on account of the result of the Dutch invasion, or the manner in which the Duke of York had been supported in it by the administration at home. On the 10th of February, however, the

Reign of
George III.

subject was introduced in the House of Commons by Mr Sheridan, who moved for an inquiry into the causes of its failure. He treated the capture of the Dutch navy as of little value, or rather as pernicious, on account of the example of mutiny which it exhibited on the part of the seamen whom we had received into our service; he admitted that the restoration of the stadtholder was a justifiable motive for our interference, but contended that Britain had treated the people of Holland ill, by obliging them to enter into the present war, and avoiding to promise a restoration of their colonies in case of a successful invasion; he asserted that the expedition itself was ill arranged, as the army after its landing had no means of moving forward on account of the want of necessaries, and, instead of delivering the Dutch, was under the necessity of entering into a capitulation for its escape, and of holding out, as an inducement to enter into this capitulation, a threat of destroying for ever the commerce of that very people whom we had embarked to save; and he contended, that to vindicate the honour of the British army, it was necessary to inquire into the cause of its misfortunes upon this occasion. Mr Dundas defended the expedition against Holland with his usual dexterity. He stated its object to be threefold: first, to rescue the United Provinces from the tyranny of the French; secondly, to add to the efficient force of this country, and diminish that of the enemy, by gaining possession of the Dutch fleet; and, lastly, by hostile operations in Holland, to oblige the French to weaken their armies in various other quarters. Mr Dundas contended, that at the commencement of the expedition a great probability existed of the success of all these objects; two of them did actually succeed, and only one failed. With regard to the capture of the fleet, he declared himself astonished that a doubt should exist about the value of such an acquisition. That fleet had been absolutely destined for the invasion of our dominions; along with it we took nearly seven thousand seamen, all of whom were liable to be employed in the French fleet, and forty thousand tons of shipping, which might have annoyed our commerce. By the invasion of Holland, also, the French had been compelled to weaken their other armies, which gave success to Suwarof in driving them from Italy, and to the archduke on the Upper Rhine and in Switzerland. They had indeed succeeded in defending Holland; but, as the price of this success, they had been severely pressed in every other quarter. At the moment our enterprise was undertaken, it was doubtful whether they would send their reinforcements thither, or to other parts of the Continent. They had poured prodigious reinforcements into Holland, by which means we were unable to rescue it from their yoke; but the result was, that they had lost every other point which they had contested during the whole campaign. With respect to the conduct of the enterprise, never was a commencement more prosperous than that of the late expedition. Sir Ralph Abercromby had sailed for the Helder on the 13th of August, and every thing promised the most rapid success. On the 14th came on the most extraordinary hurricane that ever blew from the heavens; it was found impossible to land a single soldier on any part of the coast of Holland; and this continued till the 27th. The consequence was, that the enemy knew where our army must land, and their troops came in shoals to oppose us; seven thousand men were collected; and as they were superior in number, Sir Ralph could not land his men to advantage. The ardour of the soldiers and the gallantry of the commander were never excelled on any occasion. Without any thing but their muskets and bayonets, against cavalry and artillery, they made good their landing, and by it they secured the Dutch fleet. It was alleged that the troops had no means of drawing their waggons; but

they had no waggons at all, and could not possibly have landed them had they been there. Instantly on their landing they could not want them; for all they had then to do was to secure a landing place and a post of communication. Sir Ralph had to consider what position he should take till the 1st of September, when reinforcements would arrive. The same tempest prevented the Russian troops from arriving to reinforce the army; they did not come till the 18th. The Duke of York offered to the Russian general, D'Hermann, to delay the attack, if he thought his men were not sufficiently recovered from the fatigues of the voyage; but the general requested that the attack should be made, with a promptitude and alacrity which reflected the highest honour upon him; and this ardour led him into the field two hours sooner than the time appointed. The army, however, was gloriously successful until a late hour in the day. General d'Hermann and his troops were in possession of the village of Berghen, and crowned with victory, till his zeal led him beyond a given point, and turned the fate of the day. When the attack was made the French amounted to seven thousand, and the Dutch to twelve thousand men; yet, notwithstanding this superiority of force, our troops fought and conquered; but the French continually pouring in reinforcements, the duke was advised to accede to the terms of an armistice, which was by that time mutually wished for. The duke yielded to this advice; and, by so doing, consulted the dictates of reason and humanity. Mr Dundas contended that our army returned with as much honour as they entered Holland. The Duke of York, indeed, agreed to give up eight thousand French prisoners on condition that his retreat should be unmolested; but he could not be wrong in doing so, because our prisons were overloaded with them; and he did not recede from any one article in which national dignity was concerned.

Mr Tierney supported the proposal for an inquiry. He disputed the advantages said to result from the expedition, and contended, that to a secret committee, or in some other form, ministers ought to account for their conduct, and exonerate themselves from suspicions too strong to be removed without proof. It was unconstitutional, and an insult on the house, to say this could not be done consistently with the preservation of secrecy. General Abercromby landed on the 22d of August with ten thousand men; he got possession of the Helder; he was reinforced by General Don on the 27th. Was it not strange that fifteen thousand men, headed by an able general, and going by invitation, should think it imprudent to advance? Had the Dutch been well affected, why did they not declare themselves? No French troops were then in Holland to keep them in awe. Why did not the Duke of York sail at the same time with General Don? Why were all our forces sent to one place, and forty-three thousand men cooped up in a narrow peninsula where but few could act at a time? It was strange that ministers, who were so fond of making diversions, did not think of making a diversion in some other quarter. This was a point which only military men could determine; and the house was bound to examine officers, that the truth might be known. The capitulation, he said, had fixed an indelible blot on the national character. A king's son, commanding forty thousand men, had capitulated to a French general who had only thirty-five thousand. Mr Addington observed, that having maturely and dispassionately considered the nature of the proposed inquiry, it appeared to him to rest upon two grounds: first, the propriety of judging any measure by its event; and, secondly, that in consequence of a failure, there was a necessity for investigation. It ought to be recollected, that the worst concerted plans had often produced the most brilliant success, and the best terminated

Reign of
George III.

of in disaster. No human being could command success, and no existing government control the elements. The proposed inquiry was accordingly negatived by a very large majority.

During the present year the war proved extremely eventful. The army which Bonaparte had left in Egypt under General Kleber being disgusted by the desertion of their leader, a negociation was entered into by Kleber with the Turkish grand vizier and Sir Sidney Smith; the result of which was, that the French agreed to abandon the whole of Egypt, on condition of being permitted to return unmolested to France. The convention was concluded at El Arish on the 24th of January; and the immediate return of this discontented army to France might have proved dangerous, if not fatal, to the newly-established power of the first consul. But here the usual fortune of Bonaparte prevailed. The British government, suspecting that some proposal of this kind might be made, sent secret orders to Vice-admiral Lord Keith not to consent to any arrangement which might leave so large an army at liberty to act in Europe, or which should not include the surrender of all the ships in the port of Alexandria. The consequence was, that Lord Keith refused to ratify the treaty of El Arish which Sir Sidney Smith and the Turkish grand vizier had concluded, and detained as prisoners General Dessaix and a number of troops which had been sent from Egypt. The French general Kleber immediately intimated to the Turks a determination to resume hostilities. He attacked and totally routed their army, consisting of forty thousand men, in the neighbourhood of Grand Cairo; and multitudes perished by slaughter and in the desert, while the French remained complete masters of the country. When it was too late, an order arrived from Britain to permit General Dessaix and the troops along with him to land in France, and to fulfil every part of Sir Sidney Smith's treaty; but the state of affairs had changed; Kleber had been assassinated by a fanatical Arab, and his successor, Menou, refused to evacuate Egypt; so that it became necessary, at a future period, to send an army from Britain to drive the French out of the country which they had proposed to evacuate without firing a shot or shedding a drop of blood.

The Austrian armies in Germany and in Italy were respectively commanded by General Kray and by General Melas. The campaign was conducted on the part of the French government with great ability and decision. It had been publicly announced in all the French newspapers that the armies were to be reinforced as powerfully as possible; and that an army of reserve was to be formed in a central position between Germany and Italy, from which the armies might be supplied with fresh troops according to the events of the war. Dijon was mentioned as the head-quarters of this army of reserve, and it already amounted to upwards of forty thousand men. Nobody suspected that any important plan of operations or military stratagem was concealed under the affected notoriety of this arrangement. Accordingly the Austrians commenced the campaign by an attack upon Massena in the Genoese territory; and after a succession of obstinate conflicts the French were driven into Genoa, where they sustained a siege, till compelled to surrender from want of provisions. Whilst Melas besieged Genoa, and even pushed forward his parties through Nice into the ancient French territory, Bonaparte in person suddenly repaired to Dijon and joined the army, to the assembling of which Europe had paid little attention, on account of the appellation which it had received of an army of reserve; and immediately advancing, he crossed the Alps by the Great St Bernard, and descended into the Milanese with little opposition. At the same time powerful reinforcements joined him from Switzerland, of which the

French troops continued to hold possession. Bonaparte thus placed himself in the rear of the Austrian general, and hazarded every thing upon the fortune of a single battle. He was accordingly attacked on the plain of Marengo, near Alessandria; and, as the Austrians were greatly superior in cavalry and artillery, they proved victorious during the greater part of the day. The French wings were turned, the centre division was broken, and scarcely six thousand men stood firm at any one point, when General Dessaix, late in the action, arrived with a reinforcement of six thousand troops, though fatigued by a rapid countermarch of several leagues. At this moment the battle seemed to be irretrievably lost. The French had been thrown back in the utmost disorder upon Montebello, where Lannes was still maintaining a furious though desperate resistance; the whole field of battle was in possession of the Austrians; the French troops were crowded together in a disorganized mass, in which the enemy's artillery were committing the most frightful havoc; and only one effort more seemed necessary on the part of the Austrians, with their fine cavalry, in which arm they were greatly superior, to complete the destruction of the French army. Matters were in this state when Dessaix arrived, who, perceiving the desperate situation of affairs, instantly hurried his division into action. Surprised at, but not unprepared for this renewed attack, the Austrians developed a powerful force to oppose it; Dessaix fell mortally wounded; and his division were on the point of being overwhelmed, when an event almost unexampled in war not only saved the French army from destruction, but totally changed the fortune of the day, and converted a disastrous defeat into a complete victory. While a body of Austrian grenadiers, six thousand strong, were advancing to the charge along a broad causeway, and carrying all before them, they were suddenly and furiously attacked in flank by General Kellerman, at the head of six hundred horse, which he had managed to conceal among some mulberry trees. A panic immediately seized them, and believing themselves assailed by the mass of the French cavalry, they threw down their arms. The whole affair passed in an instant, and even the victors themselves were astounded at their own success. Bonaparte, however, lost not a moment in profiting by this extraordinary turn of fortune. The French rallied with their usual promptitude on Dessaix's division, which still preserved some degree of order; resumed their former positions; recommenced the battle, which they had a few minutes before given up for lost; and, animated with the enthusiasm inspired by Kellerman's extraordinary success, drove the Austrians from the field. In the French official account of this memorable conflict, which decided the fate of all Italy, no mention whatever is made of Kellerman's gallant and decisive attack; and it reflects little credit on the memory of Bonaparte, that, though he afterwards heaped wealth and titles in boundless profusion on the man who had not only saved him and his army from destruction, but converted a disastrous defeat into a splendid triumph, he should never have made any public admission of the unparalleled achievement which changed the fortune of the day. The service was probably considered as too great to be acknowledged, because it could never be sufficiently rewarded; and it ill comported with the character of Bonaparte to admit that, in genius, promptitude, and energy, he could ever be surpassed by any of his lieutenants. On the following day Melas entered into negociation, and, as the price of an unmolested passage to the Austrian states, he agreed to abandon all Piedmont, and the basin of the Po, and to surrender twelve of the strongest fortresses in Europe.

On the side of Germany the French under General Moreau were scarcely less successful. They passed the Rhine

Reign of
George III.

in the neighbourhood of Strasburg, where they were opposed by the Austrians. But this was only a feigned attack. Speedily retreating, the main body of their army descended from the mountains of Switzerland, and crossed the Rhine in the rear of the Austrian army near Schaffhausen. After a desperate engagement, the Austrians were defeated with the loss of ten thousand men, of whom four thousand were taken prisoners. As the mode of attack had been unforeseen, and was consequently unprovided for, the loss of magazines and baggage was immense. In another and harder fought battle, at Moskirch, the Austrians lost upwards of eight thousand men. At Biberach, Augsburg, and Hochstet, the French were equally successful; and the result was, that the Austrians were under the necessity of crossing the Danube, leaving the French masters of the electorate of Bavaria, and in a condition to invest Ulm. A general suspension of hostilities was now agreed to, by which both parties retained possession of their actual positions; and a negotiation for peace was entered into between the French and Austrians, which produced an attempt to negotiate on the part of Great Britain; but as the French also demanded a naval armistice, the negotiation was dropped; and after a considerable delay, during which the Austrian minister at Paris concluded a treaty which his court afterwards disowned, preparations were made for re-opening the campaign. But the French ultimately consented to renew the armistice with the Austrians, on condition of obtaining possession of the important fortresses of Ulm, Ingoldstadt, and Philipsburg. These armistices and negotiations proved of great service to the French. The consent to a truce in the midst of an unexampled career of victory gave an appearance of moderation to the new consular government; whilst the conclusion of a treaty at Paris, to which the Austrian government afterwards refused to adhere, induced neutral nations to consider Bonaparte as anxious for the attainment of peace. Hence the wonderful success which attended his arms, during the early part of the campaign, was far from rousing the jealousy of the other states of Europe. The northern nations eagerly courted his alliance; and the emperor Paul of Russia, actuated by the natural instability of his temper, and an admiration of military success, not only entered into a close alliance with Bonaparte, but seized the British vessels in his ports; whilst the Danes, Swedes, and Prussians, formed a confederacy for evading the right claimed in war by maritime states, of preventing their enemies from being supplied with naval stores by means of neutral vessels.

In the meanwhile Great Britain was greatly distressed by a scarcity of provisions, and riots broke out in London and some provincial towns. On this account parliament assembled on the 11th of November, and the principal discussion which occurred in it related to the scarcity which prevailed throughout the country, and involved in great difficulties both the middle and lower classes of society. The members of opposition asserted that the war and the scarcity were closely connected; whilst Mr Pitt and his colleagues contended that a more obvious cause might be found in the deficiency of the two preceding crops, owing to cold and rainy seasons. A royal proclamation was issued in the beginning of December, exhorting all heads of families to reduce the consumption of bread by at least one third, to abstain from the use of flour in pastry, and to restrict the consumption of oats and other grain by horses; and acts of parliament were at the same time passed prohibiting the exportation, and offering bounties upon the importation, of grain. These measures, however, were of a very doubtful character. By increasing the alarm of scarcity they induced wealthy persons to buy up grain, and to withhold it from the markets; the

prohibition of exportation of provisions was unnecessary, when a better price could be obtained in Britain than elsewhere; and the same high prices afforded a sufficient bounty for importation.

At the commencement of the following year government laid an embargo on all Russian, Danish, and Swedish ships in British ports; so that Great Britain was now at war with nearly all Europe. Austria, indeed, ventured to renew hostilities; but the French general Moreau, having defeated the Archduke John with tremendous loss, at Hohenlinden, drove back the Austrian army upon their capital, advancing within seventeen leagues of Vienna; whilst at the same time signal defeats were sustained by them both in Italy and in Franconia. From the necessity of their affairs, therefore, the Austrians were compelled to sue for peace, which was accordingly concluded at Luneville. The Netherlands and the Milanese were resigned; France extended her boundary to the Rhine; and Tuscany was relinquished by the grand duke, who was to receive an indemnification in Germany; whilst, on the other hand, the city of Venice and a portion of its ancient territory were given up to Austria. The German princes who suffered by the treaty were to receive an indemnification out of the ecclesiastical states of the empire; thereby weakening still further the influence of the house of Austria. By this treaty the French became masters of Europe to the southward of the Rhine and of the Adige.

The commencement of the year 1801 was marked in Great Britain by the termination of Mr Pitt's administration. When this event was announced to the public, it created no small degree of astonishment. Since Mr Pitt had come into office a new generation had sprung up; and a succession of the most extraordinary public transactions had occurred, amidst all of which that minister, with his kinsman Lord Grenville, and his friend Mr Dundas, had remained firmly established in power. The authority and influence of these men had in some measure interwoven itself in the opinions of the people, and they were surrounded by a train of powerful adherents, dependent on their patronage; whilst, at the same time, Mr Pitt himself retained such a degree of popularity as caused his dismission or resignation to appear a very bold measure in the present state of affairs. The ostensible cause assigned for Mr Pitt's dismission obtained little credit with any one. He was represented as having promised to the Irish Catholics an equalization of privileges with their fellow-subjects, on condition of their acquiescing in the treaty of union; but it was pretended that, since his majesty had been persuaded to oppose the measure, as contrary to his coronation oath, the ministry, in such a state of matters, could no longer honourably remain in office. Of the true cause of this change little is publicly known. It does not seem necessary, however, to search into secret history for an explanation of a transaction which may be sufficiently accounted for on principles which must be obvious to all. The influence acquired by Lord North, arising from the patronage he enjoyed during the American war, enabled him, by combining with others, to establish a formidable interest in the legislature. But the power possessed by him was trifling when compared with that which Mr Pitt and his friends possessed. The war which Mr Pitt had conducted had been expensive in a degree altogether unexampled in preceding times; whilst the circumstances under which it commenced had united, as a party under him, almost all the persons of property in the kingdom. During his long administration, too, the crown possessed, in a more direct manner than formerly, the increasing patronage of India; and hence the leading members of this administration might be regarded as having attained a degree of power and influence which could not easily be shaken,

and which might prove extremely inconvenient, when held by any combination of subjects in a free country. In such circumstances, it was natural for an experienced prince to wish for a change. Mr Pitt had been originally taken into office as the agent of the crown in the House of Commons, to support the royal prerogative there, against a combination of powerful and accomplished men; he had enjoyed great popularity, and had been considered as the man best qualified to conduct the war of the French revolution; and as he knew the high rank which he held in public estimation, and treated the House of Commons with but little deference, it is not improbable that in the cabinet he may have presumed upon the indispensable importance of his own services, and, accounting himself necessary to the administration of the empire, arrogated a degree of independence not at all graceful nor becoming in a mere instrument of the crown. Some, however, have thought that his retirement on this occasion is to be ascribed to a totally different cause; that as he had been mainly instrumental in plunging the country into the war with France, and as all his schemes for humbling that nation had proved abortive, he could neither admit his error, nor adopt the only means which now remained, in some degree to atone for it; and that he desired to escape the mortification of negotiating a peace with a power which he had so often denounced, and which he wished to exclude from the pale of political and social relations in Europe. And, in support of this view, it may be mentioned that, on the dismissal of this administration, a resolution appears to have been at the same time adopted by the British court, seriously and earnestly to endeavour to obtain peace upon any tolerable terms.

With regard to the general merits of Mr Pitt's administration, we are still probably too much involved in the passions and prejudices which it excited to be able to appreciate them with sufficient candour and intelligence. He derived great advantage from the copious and stately eloquence which he at all times displayed in the House of Commons; and certainly no man ever possessed so completely the art of managing the people of England, and retaining their attachment, at the same time that he continued to possess the confidence of his sovereign. Although he obtained the government of the British empire at a very youthful age, the prudence of his conduct and the magnitude of some of his designs entitle him to a very high rank as a statesman. His sinking fund, though not contrived by himself, and though based on erroneous principles, was a great and important measure, as it contributed to sustain the national credit at a period of unexampled difficulty and embarrassment, and enabled the country to weather a contest which might otherwise have proved fatal to its independence. His commercial treaty with France was also, whatever the political economists may say to the contrary, a measure recommended by the soundest wisdom. The most ambiguous circumstances in Mr Pitt's public conduct were those which related to parliamentary reform, to the trial of Mr Hastings, and to the slave-trade, in which he adopted the popular side in the debate, although the court was known to be hostile to his avowed sentiments, which accordingly were never successful. The most difficult question relates undoubtedly to the war with France. Though by the forms of the British constitution Mr Pitt was responsible for engaging in this war, and for continuing in it, yet as he was not actually the head of the state, it is possible that the interference of Britain might not originate with him, and that he had only the alternative of engaging in the war or of relinquishing his power. If the war is to be considered as advised and conducted by him, he is responsible for all its consequences, the enormous aggrandisement of France,

the subjugation of the weaker states, and the accumulation of that intolerable load of debt which hangs like a mill-stone round the neck of this country, and encumbers every effort it can make to develop its natural resources. Had Britain originally remained neutral, or rather, had she negotiated in favour of the independence of France, brought into hazard as it was by the combination of the great military powers, that country would have been confined within her ancient boundary; Italy, Switzerland, and Holland would have retained their independence; and the strength of Austria would have remained unbroken; or, if Britain had withdrawn early from the contest, and avoided urging and subsidizing the continental powers, until they were successively vanquished, the same result might have ensued. On the other hand, if the war is to be considered as undertaken to overturn the principles of the French, it was undoubtedly successful to a certain extent, as it compelled them to abandon these principles, and to have recourse to a military usurpation; but it ought to be remembered, that to Britain as a nation the political principles of the French were of no importance whatsoever, whilst their permanent aggrandisement was calculated to bring into hazard our very existence as an independent nation. Mr Pitt and his friends called forth the resources of the country for the support of the war to an astonishing extent. Immense treasures were lavished in supporting our allies in fruitless or absurd expeditions, and in schemes which served only to augment the public burdens, and to increase the influence of the crown by the extension of its patronage. The acquiescence of the public in the war was preserved by keeping the minds of men in a state of constant alarm, from the fear of danger to the constitution, in consequence of the alleged disaffection of a body of the people; and in this manner a constant spirit of persecution was maintained throughout the country, which thus seemed to be ruled rather by a jealous faction than by a legitimate government. The concluding measure of Mr Pitt's administration, the union with Ireland, is entitled to much praise. It was suggested by the course of events, and tended to remedy a great defect in the constitution of the British empire, the want of consolidation into one united political body.

Of the associates of Mr Pitt, Lord Grenville, who acted as minister in the House of Lords, was the principal in England, and Mr Dundas in Scotland, and perhaps also in the rest of the empire. This last gentleman possessed the greatest share of power ever intrusted to any Scotsman since the union, excepting for a short time to Lord Bute. During a considerable length of time he appears to have conducted almost the whole public business of that vast assemblage of nations, in all the climates of the globe, which constitutes the British empire; and under his patronage, and that of his friend Mr Pitt, a numerous body of dependents rose to the possession of boundless opulence; whilst they themselves, engrossed by the pursuits of ambition, were understood to have been somewhat careless of their private concerns.

At the time when the change of ministry took place the king became affected with a severe illness, supposed to be the result of anxiety and agitation of mind. In making choice of a new prime minister, however, he avoided admitting into power the party which had opposed the war; and selected Mr Addington, who, as we have already mentioned, was originally patronized by Mr Pitt, and who, as speaker of the House of Commons, had gained approbation by his good temper, prudence, industry, and conciliating manners. This gentleman appears to have obtained from his predecessors in office a promise of support in parliament; and he was therefore represented throughout the country as nothing more than a nominal minister, holding a tem-

Reign of
George III.

porary situation, which, on the first opportunity, he was to relinquish in favour of Mr Pitt and his friends. And this account of the state of affairs derives plausibility from the actual support which the new minister received from these gentlemen, and from the influence which they evidently retained in the nomination to all inferior offices. Mr Addington's appointment as first lord of the treasury and chancellor of the exchequer was followed by the nomination of Lord Eldon to the office of lord high chancellor, of Lord St Vincent to that of first lord of the admiralty, of Lord Hawkesbury as secretary of state for the foreign department, of Lord Pelham for the home department, and of Colonel Yorke as secretary at war. Lord Eldon was succeeded by Sir Michael Pepper Arden, then created Lord Alvanley, as chief justice of the common pleas; and Mr Addington by Sir John Mitford, afterwards Lord Redesdale, as speaker of the House of Commons. Sir William Grant was made master of the rolls, and Mr Law and Mr Percival attorney and solicitor generals.

On the 2d of February the parliament of Great Britain and Ireland was opened; but as the king's illness immediately succeeded that event, the new administration did not obtain formal possession of office until the month of March, and during the interval the old ministers continued to hold their former situations. At the opening of the imperial parliament, as it was now called, the speech from the throne expressed great satisfaction that the crown would now be able to avail itself of the advice of the united parliament of Great Britain and Ireland; hoped that this memorable era, distinguished by a measure calculated to consolidate the strength of the empire, would be equally marked by the energy and firmness which the present situation of the country so peculiarly required; and stated that the court of Petersburg had treated our representations of the outrages committed against our ships and property, and against Englishmen, with the utmost disrespect, and that acts of injustice and violence had aggravated the first aggressions. It mentioned that a convention had been concluded between Petersburg, Copenhagen, and Stockholm, the avowed object of which was to establish a new code of maritime law, inconsistent with the rights and hostile to the interests of this country; and that the earliest measures had been taken to repel this confederacy, and to support those principles essential to the maintenance of our naval strength. It recommended an inquiry into the high price of provisions, and promised a termination of the present contest whenever it could be done consistently with security and honour.

When the usual address was moved, some discussion occurred in both houses regarding the actual state of affairs, more particularly as connected with the combination of the northern powers against Britain. In the House of Commons Mr Grey deplored the prospect of a war with all Europe. Russia had evidently been guilty of the grossest violence and injustice towards this country, in the confiscation of the property of our merchants, and in the treatment of our sailors; but the emperor accused the British government of violating a convention by which he was to receive the island of Malta as the reward of his co-operation against France; and the truth of this assertion ought to be investigated. Concerning the northern confederacy, Mr Grey remarked, that the principles on which it was founded were of no recent origin, as indeed was very generally known. Mr Pitt, who still acted as chancellor of the exchequer, declared, that with every one of the three northern powers, independently of the law of nations, we had on our side the strict letter of engagements by which they were bound to us. In the convention signed between Great Britain and Russia, the latter bound herself to use her efforts to prevent neutral powers

from protecting the commerce of France on the seas or in the ports of France; and Denmark and Sweden had expressed their readiness to agree on that very point which they were now disposed to contend. We did not indeed know the precise terms of their new convention; but as its existence and general object were acknowledged, we must necessarily act upon the supposition of their hostility.

In March Mr Grey moved for an inquiry into the state of the nation. We were now, he said, in the ninth year of a war with France, and threatened with a war by all the maritime states of Europe, if not actually involved in it; we had added L.270,000,000 to the capital of our national debt, and above L.17,000,000 to our annual taxes; we found ourselves opposed to France, which was now extended in territory, increased in population, and supported by all the states of the north. We were opposed to her with diminished means, exhausted strength, and stripped of every ally. It was, therefore, incumbent on the representatives of the people to enter into a serious inquiry into the means most likely to restore to us security and happiness. The conquests we had made during the war had not compensated our disasters or the acquisitions made by France. Her frontier now extended to the Rhine, to the Alps, and to the ocean; yet all these possessions we had consented to abandon as the price of peace which ministers might have made with France confined within her ancient limits, while our own country was prosperous and happy. Our losses were thus irretrievable, and our triumphs empty. There was almost no shore from the Texel to the Adriatic which had not witnessed the defeat of our forces and the disgrace of our arms. The unfortunate attempt upon Dunkirk, the shameful retreat through Holland, the evacuation of Toulon, the abandonment of Corsica, and the expedition to Quiberon, were all fatal proofs of ill-concerted schemes; but the late expedition against Holland was more disgraceful than the rest, because it terminated in a capitulation to an inferior force. Administration had acted with such imprudence that even our very allies were now converted into enemies. The Swedes and other neutral nations had complained that their trade was molested, their ships detained, and justice refused them in our courts, or so long delayed that it was useless. These were points which undoubtedly deserved investigation. Nor did the internal condition of the country less require consideration. The sum of L.270,000,000, as already mentioned, had been added to the national debt, exclusive of imperial and other loans, and the reduction by the sinking fund; and yet the ex-ministers alleged that they left the country in a flourishing condition. Yet every Englishman, from diminished comfort, or from positive distress, felt this declaration to be an insult. The situation of the sister kingdom was also alarming in the extreme. Since the recall of Earl Fitzwilliam, Ireland had been the scene of transactions shocking to humanity. Was it now tranquil? Though rebellion had been crushed in the field, it lurked in secrecy; the mass of the population was disaffected; and nothing prevented the separation of Ireland from Britain but the inability of France to send a force to assist the rebels. Upon these grounds he called for an inquiry into the actual state of affairs, and demanded the support of the new administration, as a testimony of their disapprobation of the measures of their predecessors.

Mr Dundas defended, with plausible statements and arguments, the conduct of the war. The principle which he laid down was, that war ought to be directed to the destruction of the commerce and colonial possessions of the enemy, including their maritime power, which must depend upon their commerce. It was hardly possible for England to be long at war with France without being in-

Reign of George III. involved in disputes on the Continent, which might deprive us of many of the markets which we had for our goods; and therefore it was peculiarly our interest to gain these colonies, that they might remain open for our commodities. In order then to judge how far the war, conducted on this principle, had been disastrous and disgraceful, he would state its progress and success. Hostilities commenced against France in February 1793; and in that year Tobago, St Pierre, Miquelon, Pondicherry, part of St Domingo, and the fleet at Toulon, were taken, besides the possessions of the Newfoundland fishery. In the year 1794 we captured Martinique, Guadaloupe, St Lucie, the Saints, Corsica, and Mariagalante; in 1795, Trincomalee and the Cape of Good Hope; in 1796, Amboyna, Berbice, and Demerara; in 1797, Trinidad, with four ships of the line either taken or destroyed; in 1798, Minorca; in 1799, Surinam; in 1800, Goree, Malta, and Curaçoa. These had been our successes. With regard to the expedition against Holland, he defended it on the same principles as formerly. As to the navy, he stated, that since the commencement of the present war we had taken or destroyed eighty sail of the line belonging to the enemy, a hundred and eighty-one frigates, two hundred and twenty-four smaller ships of war, seven hundred and forty-three French privateers, fifteen Dutch and seventy-six Spanish ships. The losses we had sustained were three sail of the line, one of which we had retaken; one fifty gun ship, which we also retook; and of the frigates captured by the enemy, the Ambuscade alone remained in their possession. One of the great advantages to be derived from the colonial possessions of the enemy was the markets they furnished for our manufactures. In the year 1793 the manufactures sent from this country to the West Indies amounted to above L.1,800,000 sterling. Before the war our exports to the East Indies did not exceed one million, but in the preceding year they exceeded L.1,600,000, a proof that we had not lost the markets of Europe. The failure of an expedition was now considered as a decisive proof of misconduct in ministers; but in the glorious Seven Years' War, which was in every body's recollection, there were expeditions attempted which completely failed, though the failure was not considered as a proof of incapacity or neglect in Lord Chatham. The conquests which we then made were Senegal, Louisburg, St Lucie, Duquesne, Guadaloupe, Martinique, the Havannah, Montreal, Pondicherry, Grenada, Belleisle, besides destroying the fortifications of Cherbourg; and we took or destroyed thirty-two sail of the line and fifty-eight frigates, besides a proportionable number of smaller vessels. We were now in possession of every place taken in that war, excepting Guadaloupe, the Havannah, and Belleisle; but, on the other hand, we had gained the Cape of Good Hope, Ceylon, Demerara, Berbice, and all the Dutch possessions in the East and West Indies, added to Minorca and Malta. We had also destroyed the confederacy formed against us in the East Indies, and acquired a great increase of power and territory in that quarter of the world.

Mr Pitt, after expressing his respect for the new administration, observed that no point had been more disputed than that of confidence in ministers. By some people it was held that no person was entitled to it, till he had given proofs of having merited it. But this never could be carried in substance to the letter; for whoever entered into any employment, must at first be new to it: there could be no experience without trial; but when persons had been tried in one situation, and had acquitted themselves well in it, it was a rule to give them credit when they entered into another, until proof of their incapacity or misconduct appeared. He then lavished encomiums on Mr Addington, on Lord Hawkesbury, and on Earl St Vin-

cent, and asked the gentlemen of the opposition if they knew any one among themselves superior to Lord Hawkesbury, excepting one, Mr Fox, whose transcendent talents made him an exception to almost any rule. Of the other individuals composing the new administration, much might be said; but he would only add, that it showed little reflection or consideration to affirm that the present ministers were unentitled to a constitutional confidence; and the house was bound by the best principles of policy to wait to see the conduct of the servants of the crown before they withheld it. Upon the subject of the retirement or dismissal of the late administration, he contended that his majesty had a right to part with his servants, and his servants to retire, without any explanation being given to the public. Concerning the affairs of the Irish Catholics, and their connection with the dismissal of administration, he stated, that a memorandum had been sent, in the name of a noble lord at the head of the executive government of Ireland, who thought it essential to communicate the grounds of the change of administration to persons more immediately connected with the Catholics; and it had been at his express desire that this communication had been made, and the motives explained to them which led to the change, in order to prevent any misrepresentation. Emancipation of the Catholics was a term he disclaimed. He never understood the situation of the Catholics was such as to need what deserved to be called emancipation; but he thought the few benefits which they had not yet anticipated might easily have been added to those so bountifully conferred on them in the present reign, not as a matter of right, but of liberality and political expediency. Had such a measure preceded the union, indeed, it would have been rash and destructive; and even now, if any attempt was made to push it so as to endanger the public tranquillity, or to pervert the affections of any of his majesty's subjects, the ex-ministers would be forward and firm in resisting it. But he hoped the day would come when such a measure might be revived, and carried in the only way in which he wished to see it carried, conformably to the general tranquillity of the empire. To him it had appeared of such importance, that, being unable to bring it forward as a measure of government, he did not conceive it possible for him, with honour, to remain in the same situation; and he wished it to be understood, that whenever the same obstacles did not exist, he would do every thing in his power to promote its success. He denied, however, that any of those who had retired from office had so pledged themselves to the Catholics as to be under the necessity of resigning their offices because they could not perform their promise; and he also denied that ever the Catholics supposed they had received such a pledge. An expostulation was natural, but a pledge had never been given. He concluded that the British government had justice on its side, or rather was supported by the law of nations, in the claims which it now maintained to search neutral vessels for military stores on their way to the enemy, and to declare particular French or other ports under blockade, to the effect of thereafter having a right to arrest neutral vessels attempting to enter them.

Mr Fox observed, that it was undoubtedly a doctrine recognised by the law of nations, that free bottoms did not make free goods; but he doubted much the propriety of discussing it at this critical juncture. He thought our claims upon this subject were extended too far when they were made to reach to naval stores, as these had not been at former periods considered as contraband. He then adverted to the successes of the war, which had been enumerated by Mr Dundas. On the navy he bestowed merited praise, and also on the late first lord of the admiralty, assigning his merit as the reason for the constant

Reign of George III.

Reign of
George III.

and brilliant triumphs of the navy; whilst our military expeditions, though our troops were as brave as our seamen, had generally failed. In naval tactics almost every thing depended on the talents of the officers; whereas, in military movements, much depended on the original design. The boasted capture of islands was not the object of the war: our object had been to protect Europe against France; and how had we succeeded? Which of the two nations had been most aggrandised in the course of it? A country paying double its land-rent was in a state demanding inquiry. The war secretary had talked much about the diversion of war, and shown us its nature on his principles. He had sent the Duke of York and an army of thirty thousand men to the only neck of land perhaps in the world where a fifth part of their own numbers was equal to cope with them. Of the armistice of Hohenlinden, and the negotiation which followed it, Mr Fox spoke with indignation, reprobating the conduct of the minister, which had so fatally proved that eloquence was distinct from wisdom. Time had now evinced that all the great objects of the war were defeated, and that our allies had deserted us; and when no prospect of success remained, we might resort to negotiation. The same men who had rejected the proposals of Bonaparte with insolence, must approach with respect, suing for favour, to avoid participating in the disgrace. With regard to the Irish Catholics, no man ought to be deprived of his rights because he worshipped God according to the dictates of his own conscience; and it was a reflection upon parliament to say, as Mr Pitt had said, that he could not there propose a measure which he approved. He declared his belief that no such difficulty existed, but that the late minister might wish to retire for a season, till overtures of peace were made, which he could not make, without mortification, to the man whom he had insulted. He spoke of the change of administration as a fortunate occurrence. Some indeed might suspect, from the panegyric of Mr Pitt, that the new ministers were the less gaudy puppets, directed by those who had quitted their stations; and if they adopted the system of their predecessors, with the additional blame of being hostile to the Catholic claims, acting in this point from their own motives, they would be unworthy of confidence.

The new chancellor of the exchequer, Mr Addington, observed, that the degree of confidence which the House of Commons ought to extend to the present ministers, it was not for him to conjecture; they only asked for that portion of it which should be constitutionally reposed in persons duly appointed by his majesty, unless it was precluded by antecedent character and conduct. He then commented on all the leading points in dispute with the northern powers; and after stating the grounds of the principle asserted by this country, and referring to the exception made by existing treaties, gave it as his opinion that the right for which we contended was vital and fundamental, and could neither be abandoned nor compromised. Lastly, he felt it incumbent on him to declare that it was the determination of his majesty's servants to take such steps as appeared to them best calculated for the restoration of peace; that no form of government in France would obstruct negotiation; and that if there was a corresponding disposition on the part of the enemy, the grand object would be accomplished. The motion for inquiry was then rejected by a majority of more than two to one.

Notwithstanding the change of ministry, Mr Pitt brought forward the business of the supplies in the House of Commons. Their amount was L.35,587,462; of which sum L.15,800,000 was for the navy, L.15,902,000 for the army, and L.1,938,000 for the ordnance. The income tax

was now stated as only amounting to about L.6,000,000. As some deficiencies of former estimates required to be provided for, Mr Pitt stated, that the whole charge of the two countries, for the service of the year, would amount to L.42,197,000, which would be divided between the two countries thus: Great Britain for its fifteen sevenths of the joint expense, and those charges which belonged separately to her, would have to defray, in round numbers, L.37,870,000; and the charges falling upon Ireland would be L.4,324,000. The sum of L.25,000,000 was raised by way of loan, and new taxes were imposed upon paper, tea, houses, lead, the post-office, and various other articles. The income tax was also further mortgaged, so that the debt for which it was pledged amounted to L.76,000,000.

In the meanwhile, to prevent the active co-operation of Denmark with Russia, and if possible to break up the northern confederacy, an armament was fitted out in the British ports, consisting of eighteen sail of the line, and as many frigates, sloops, bombs, fire-ships, and smaller vessels, as made the whole amount to about fifty-three sail. This fleet, under the command of Admiral Sir Hyde Parker, with Vice-admiral Lord Nelson as his second, sailed from Yarmouth on the 12th of March 1801, and soon afterwards reached its first rendezvous at the entrance of the Cattegat. The Danish navy at this time consisted of twenty-three ships of the line, with about thirty-one frigates and smaller vessels, exclusive of guard ships. The Swedes had eighteen ships of the line, fourteen frigates and sloops, seventy-four galleys and smaller vessels, besides gun-boats, all in a state of respectable equipment. The Russians had eighty-two sail of the line and forty frigates, and of these thirty-one sail of the line and a proportional number of frigates were in commission in the Baltic, being divided between Petersburg, Archangel, Cronstadt, and Revel; but their fleet was ill built, ill manned, ill officered, and ill-equipped; and, of the number in commission in the Baltic, probably not more than twenty sail of the line could have been put into a condition to act against an enemy. At this time the Swedes had eleven sail of the line at Carlscrona, ready for sea, and in tolerable fighting trim; the Danish fleet at Copenhagen consisted of ten sail of the line ready for sea, exclusive of about an equal number in an unserviceable state; and, assuming the available Russian force as above stated at twenty sail of the line, it thus appears that the entire effective strength of the fleets of the northern confederates amounted to forty-one sail of the line, besides frigates and smaller vessels. But as not more than twenty-five or twenty-six of these could by any means have been assembled at a given point, and as even the best of them were decidedly inferior to our ships in condition, equipment, discipline, and skill, eighteen, or even fifteen British sail of the line were more than a match for them. This explanation is necessary to show that the British government were not guilty of any rashness in sending to the Baltic a force apparently so small in comparison of that to which it was opposed; though they certainly deserve the strongest reprobation for allowing any petty consideration to prevent them from appointing Nelson to the command.

It was at first hoped that Denmark, notwithstanding her hostile demonstrations, would prefer negotiation to war; but this expectation having been disappointed, and the Danish government, instead of conciliation, having assumed a tone of open defiance, preparations were made for forcing the passage of the Sound, though in these much valuable time was lost through the irresolution of the admiral, Sir Hyde Parker. At length, however, the British fleet weighed anchor at six o'clock in the morning of the 30th March, and with a fine breeze at north-north-west

Reign of
Geor. III. entered the Sound in a line a-head, the van division com-
manded by Lord Nelson in the Elephant, the centre divi-
sion by the commander-in-chief, and the rear division by
Rear-admiral Graves. At seven the batteries at Elsinour,
which had been represented as tremendous, commenced
firing at the Monarch, which was the leading ship, and the
other ships as they passed in succession; but the distance
was so great that not a shot took effect, nor did any of the
British ships fire in return except the van division, which
only discharged a few broadsides. As the strait at Elsi-
neur, however, is less than three miles across, a mid-chan-
nel passage would undoubtedly have exposed the ships to
a fire from Cronenburg Castle, adjoining Elsinour, on the
one side, and from the Swedish town of Helsingburg on the
other; but the British having observed that the batteries
of the latter mounted only eight guns of a small calibre,
inclined to the Swedish shore, where not even a show of
opposition was made, and passing within less than a mile
of it, avoided a fire which, as proceeding from nearly a
hundred pieces of cannon, could scarcely have failed to
do much injury to the ships. About noon the fleet an-
chored at some distance above the island of Huen, which
is about fifteen miles from Copenhagen; and the com-
mander-in-chief, Vice-admiral Lord Nelson, and Rear-ad-
miral Graves, accompanied by Captain Domett and the
commanding officers of the artillery and troops (namely,
the forty-ninth regiment, two companies of the rifle corps,
and a detachment of artillery which had been embarked
on board a division of the fleet in the Downs), proceeded
in a lugger to reconnoitre the enemy's defences. These
were soon ascertained to be of the most formidable de-
scription. It was apparent that the Danes could not be
attacked without great difficulty and risk; and when a
council of war was called in the afternoon, much as usual
was urged to show the propriety of forgoing, or at least
delaying, the attack. Councils of war never fight. But
happily the opinion of Nelson prevailed, and he offered his
services for the attack, requiring ten sail of the line and
all the small craft. Sir Hyde Parker willingly accepted
the tender, gave him two more line-of-battle ships than he
asked, and wisely left every thing to his own judgment.

The force at Copenhagen was not the only obstacle to
be contended with. The approach to it was by a channel
extremely intricate and little known; and, to increase the
difficulty of navigating it, the Danes had removed or mis-
placed the buoys. But Nelson himself saw the soundings
made, and buoys laid in the outer channel, between the
island of Saltholm and the Middle Ground, boating it upon
this exhausting service until it was completed. An attack
from the eastward was first meditated; but a second ex-
amination of the Danish position, on the 31st, and a fa-
vourable change of the wind, determined the vice-admiral
to attack from the south. Accordingly, on the morning
of the first of April, the British fleet removed to an an-
chorage within two leagues of the town, off the north-
western extremity of the Middle Ground; a shoal extend-
ing along the whole sea front of the city of Copenhagen,
and leaving an intervening channel of deep water called
Konigstiefe, or King's Channel, about three quarters of a
mile wide. In the course of the forenoon Nelson, accom-
panied by Captain Riou of the Amazon, reconnoitred for
the last time the position which he was about to attack;
and soon after his return at one o'clock the signal to weigh
appeared at the Elephant's mast-head. It was received
with a shout throughout the whole squadron, and prompt-
ly obeyed. They weighed with a light and favourable
wind; the small craft pointed out the course distinctly;
Riou led the way in the Amazon; and coasting along the
edge of the right hand shoal or Middle Ground until they
reached and partly rounded its southern extremity, the

squadron anchored off Draco Point just as the darkness
closed, the headmost of the enemy's line not being more
than two miles distant. Captain Hardy now proceeded
in a small boat, under cover of the night, to examine the
channel between the anchorage and the Danish line, and
actually approached near enough to sound round the first
ship of the latter, using a pole lest the noise of throwing
the lead should occasion a discovery. Having completed
his task, he returned about eleven o'clock, and reported to
the admiral the depth of the water, and the practicability
of the channel up to the Danish line. This was gratifying
news to Nelson, though it added to his impatience, and
prevented him from sleeping during the remainder of the
night, the whole of which was spent in preparing instruc-
tions and receiving reports.

The force now about to be attacked was of the most for-
midable description. It consisted of eighteen vessels, all
two-decked ships, but some of them old and dismantled, with
frigates, praams, and radeaux, mounting altogether about
six hundred and fifty guns, and moored in a line of about
a mile in extent, flanked at the north end, or that nearest
the town, by two artificial islands called the Trekröner or
Crown Batteries, one of thirty twenty-four pounders, and
the other of thirty-eight thirty-six pounders, with furnaces
for heating shot, and commanded by two-decked block-
ships. The entrance into the harbour and docks, which are
situated in the heart of the city, was protected by a chain
drawn across it, and also by some batteries on the north-
ern shore, particularly the Trekröner already described;
and, in addition to this, two seventy-four gun ships, Danne-
marek and Trekröner, a forty-gun frigate, two eighteen
gun brigs, and several armed zebecs, provided with furnaces
for heating shot, were moored in advantageous positions off
the mouth of the harbour. Along the shore of Amak island,
a little to the southward of the floating line of defence,
were gun and mortar batteries; and as the Danes were ani-
mated by an enthusiastie spirit of patriotism, and eager
by every possible means to repel the assailants, there was
no want of men, skilful and brave, to work the guns, either
afloat or on shore.

The day of the second of April broke, as Nelson had
hoped it would, with a favourable, south-easterly wind;
and the signal for all the captains to come on board the
flag-ship was hoisted as soon as it could be seen. As
circumstances prevented the admiral's plan of attack being
strictly followed, it may suffice to state that all the line-
of-battle ships were to anchor by the stern abreast of the
different vessels composing the enemy's line, an operation
for which they were already prepared by having cables
out of their stern-ports. The Amazon, Blanche, Alemène,
Arrow, and Dart, with two fire-ships, all under the direc-
tion of Captain Riou, were to co-operate in the attack on
the ships stationed at the mouth of the harbour, and to
act otherwise as circumstances might require. The bomb-
vessels were to station themselves outside the British line,
and to throw their shells over it; while the Jamaica, with
the brigs and gun-vessels, was to take a position for rak-
ing the southern extremity of the Danish line; and a sim-
ilar station was assigned to the Desirée. It was also
intended that the forty-ninth regiment, under Colonel
Stewart, and five hundred seamen under Captain Free-
mantle of the Ganges, should storm the principal of the
Trekröner batteries, the instant that its fire should be
silenced by the cannonade from the ships. Between eight
and nine o'clock the pilots, most of whom had been mates
in Baltic traders, were ordered on board the Elephant.
But as they hesitated about the bearing of the east and
of the shoal, and the exact line of deep water, it became
evident that their knowledge was not to be trusted. Nelson
was extremely perplexed. The signal for action had been

Reign of
George III.

Reign of
George III.

made; the wind was fair; not a moment was to be lost. They were urged to be steady, to be resolute, and to decide; but they wanted the only ground for steadiness and resolution in such a case; and Nelson had now reason to regret that he had not trusted to Captain Hardy's single report. At length Mr Alexander Briarly, the master of the *Bellona*, undertook to lead the fleet; and his proposal being acceded to, the captains returned to their ships, and at half-past nine the signal was made for the ships to weigh in succession, and advance to the attack.

The *Edgar* led the way; but the *Agamemnon*, which was next in order, having anchored rather outside than off the great shoal, could not weather it, and was obliged to bring up again in six fathoms water, where the current was so strong that, although she afterwards re-weighed, and continued for a long time to warp with the stream and kedge anchors, she was compelled again to bring up nearly in the spot from which she had last weighed. When the misfortune of the *Agamemnon* was discovered, the admiral made signal for the *Polyphemus*, which followed the *Edgar*; and the *Isis* steered after the *Polyphemus*. The *Bellona*, notwithstanding a fair wind and ample room, kept too close on the starboard shoal, and grounded abreast of the outer ship of the enemy. The *Russell* following the *Bellona*, also grounded; and although both were within range of shot, their absence from their intended stations was severely felt. Three ships of the squadron were now aground and comparatively useless; so that Nelson was compelled to begin the attack with one ship of the line less than he had calculated upon as absolutely necessary. In compliance with the wish of the pilots, each ship had been ordered to pass her leader on the starboard side, from a supposition that the water shoaled on the larboard; but, as Captain Hardy had proved, the water deepened all the way to the enemy's line. The *Elephant*, flag-ship, came next; but Lord Nelson, as soon as he perceived the state of the *Bellona* and *Russell*, ordered his helm to be put a starboard, and passed within those ships; and all the ships astern followed his example. By this act of promptitude on the part of the admiral, the greater part of the fleet were saved from going on shore. At the moment when Lord Nelson's squadron weighed, Admiral Parker's eight ships did the same, and took up a position somewhat nearer the mouth of the harbour, so as to menace the northern wing of the defence; but a nearer approach was impracticable in time to render any active service in the engagement.

The cannonade commenced at five minutes after ten, and for nearly an hour the principal ships engaged were the *Polyphemus*, *Isis*, *Edgar*, *Ardent*, and *Monarch*. By half-past eleven, however, the *Glatton*, *Elephant*, *Ganges*, and *Defiance*, got to their respective stations, as did also several frigates and smaller vessels, and the action now became general. The *Desirée* proved of great service in raking the *Provesteen*, and drawing part of her fire from the *Polyphemus* and *Isis*; but owing to the strength of the current, the *Jamaica*, with the gun-vessels, could not get near enough to be of any service in the action; and the bomb-vessels were not able to execute much. The absence of the *Agamemnon*, *Bellona*, and *Russell*, disconcerted the plan of the attack, and caused several of the British ships to sustain a heavier share of the enemy's fire than had been allotted to them, or they were well able to bear; and among the sufferers on this account was the *Amazon* frigate, which, along with four others under Captain *Riou*, had boldly taken a position right against the *Trekröner* batteries. The cannonade had continued three hours, and few if any of the Danish block-ships, praams, or radeaux, had ceased firing, nor had the contest as yet taken a decisive turn to either side. Meanwhile the commander-in-chief, near enough to the scene of conflict to

know the unfavourable accidents which had deprived Nelson of one fourth of his force, and yet too distant to know the real state of the contending parties, suffered the most dreadful anxiety: and from the reports made to him that signals of distress were flying at the mast-heads of two British line-of-battle ships, and the signal of inability on board a third; from observing the zig-zag course and slow progress of the *Defence*, *Ramillies*, and *Veteran*, which he had dispatched as a reinforcement; and from the distance of the *London*, which bore his flag, preventing his judging of the relative condition of the contending parties; Sir Hyde Parker was induced to throw out the signal for discontinuing the action. When this was reported to Nelson, he continued to walk the deck without appearing to take any notice of it. At the next turn the signal lieutenant met him, and having stated that the commander-in-chief had thrown out number thirty-nine, asked if he should repeat it. "No," replied Nelson, "acknowledge it;" and presently he called after the officer to know if the signal for close action was still flying. Being answered in the affirmative, he said, "Mind you keep it so;" and, after pacing the deck for some time, moving the stump of his lost arm in a manner which always indicated great emotion, he accosted one of the officers thus: "Do you know," said he, "what is shown on board the commander-in-chief? Number thirty-nine." The officer asked what that meant. "Why, to leave off action." Then, shrugging up his shoulders, he exclaimed, "Leave off action! No, damn me if I do. You know, Foley," turning to the captain, "I have but one eye; I have a right to be blind sometimes;" and then putting the glass to his blind eye, in sportive bitterness, he exclaimed, "I really do not see the signal;" adding, after a momentary pause, "Damn the signal! Keep mine for closer battle flying. That's the way I answer such signals. Nail mine to the mast!" The three frigates and two sloops nearest to the *London*, however, obeyed the signal, and hauled off from the *Trekröner* batteries; when "the gallant, good *Riou*" was killed by a raking shot, which cut him in two, just as the *Amazon* presented her stern to one of the latter.

About half past one the fire of the *Danes* began to slacken, and at a little before two it had ceased along nearly the whole of their line. Some of the praams and light vessels had also gone adrift; but few if any of the vessels whose flags had been struck would suffer themselves to be taken possession of, and fired on the boats as they approached; whilst the batteries on the isle of *Amak* aided them in this irregular warfare. Nelson was justly irritated at this conduct on the part of the *Danes*; and at one time had thoughts of sending in the fire-ships to burn the vessels which had surrendered. But, as a preliminary measure, he retired into the stern gallery, and wrote to the crown prince of Denmark that celebrated letter, which will ever be memorable in the history of England: "Vice-admiral Lord Nelson is commanded to spare Denmark when she no longer resists. The line of defence which covered her shores has struck to the British flag; but if the firing is continued on the part of Denmark, he must set on fire all the prizes that he has taken, without having the power of saving the men who have so nobly defended them. The brave *Danes* are the brothers, and should never be the enemies, of the English." This letter was carried on shore with a flag of truce by Sir Frederick Thesiger, who found the crown prince at a sally-port. Meanwhile a destructive cannonade was still kept up by the *Defiance*, *Monarch*, and *Ganges*, while the near approach of the *Defence* and *Ramillies* silenced the fire of the *Indosfore*, then, *Holstein*, and the ships next to them in the Danish line. But the great *Trekröner* still continued its fire. This formidable work, having had nothing but frigates and sloops

Re of opposed to it, and that only for a time, was comparatively
Geor III. uninjured; and as it had just been manned with nearly
fifteen hundred men, it was considered as too strong to be
successfully stormed. It was now judged advisable to
withdraw the fleet out of the intricate channel while the
wind was fair; and preparations were making for this pur-
pose, when the Danish adjutant-general Lindholm came,
bearing a flag of truce; upon which the Trekröner discon-
tinued its fire, and the action, after having lasted five
hours, during four of which it had been hotly contested,
was brought to a close.

The message from the crown prince being to inquire the
purport of Lord Nelson's note, the latter replied in writ-
ing, that humanity was the object; that he consented to
stay hostilities in order that the wounded Danes might be
taken on shore; that he would take his prisoners out of
the vessels, and burn or carry off his prizes, as he should
think fit; and that he would consider this as the greatest
victory he had ever gained, if it should lead to a recon-
ciliation between the two countries. Sir Frederick The-
siger was dispatched a second time with the reply; and
the Danish adjutant-general was referred to the com-
mander-in-chief for a final adjustment of terms. Lind-
holm, accordingly, proceeded to the London, about four
miles off; and Nelson, availing himself of the opportunity
thus afforded, made signal to the leading British ships, all
of which were much crippled in their rigging and sails, to
weigh in succession. The Monarch led the way, and touch-
ed the edge of the shoal; but the Ganges taking her amid-
ships, drove her clear. The Glatton, drawing less water,
passed free; but the Defiance and Elephant grounded
about a mile from the Trekröner, and there remained fix-
ed for many hours, in spite of the exertions of their crews.
At the opposite end of the line, also, the Desirée, having
gone to assist the Bellona, became fast on the same shoal.
Soon after the Elephant grounded, Lord Nelson quitted
her and followed Lindholm to the London. The boats of
Sir Hyde Parker's division were actively employed during
the whole night of the 2d in bringing out the prizes, and
in getting afloat the ships which were aground; and, by
the morning of the 3d, the latter, except the Desirée, were
got off. The negotiations continued during the five fol-
lowing days; and, in the interval, all the prizes, except the
Holstein, a sixty gun ship, which was sent home, were set
fire to and destroyed. Six line-of-battle ships and eight
praams had been taken. Of the former, the Zealand, a
much finer ship than the Holstein, was included amongst
those consigned to the flames, for what reason we have not
been able to ascertain. On the 9th an armistice for four-
teen weeks was, after much discussion, agreed to; and
Denmark engaged to suspend all proceedings under the
treaty of armed neutrality which she had entered into with
Sweden and Russia.

This was a murderous action. Our loss in killed and
wounded fell little short of twelve hundred; whilst that
of the Danes, including prisoners, amounted to about six
thousand. Many of the British ships had suffered severely,
from the steady hull-firing of the enemy; whilst, as
to the Danish ships or floating hulks, the greater part of
them were literally knocked to pieces; and had the pilots
permitted the British ships to take a closer position, where
the heavy cannonades of the Glatton and Ardent would
have produced their full effect, the destruction would have
been still more complete, and certainly more rapid. For
the battle of Copenhagen Nelson received the title of Vis-
count; a paltry reward for services equally splendid in

themselves, and important to the maritime interests of
England. Reign of
George III.

On the 12th the British fleet sailed from Copenhagen
roads by the difficult channel of the Grounds, between the
islands of Amak and Saltholm, and steered for the north-
ern extremity of the island of Bornholm, in order to inter-
cept a Swedish squadron, reported at nine sail of the line.
The Swedish admiral, however, whose force consisted of
only six sail of the line, sought refuge behind the forts of
Carlsrona; and here a negotiation was opened, which, on
the 22d, ended in an agreement by his Swedish majesty
to treat for the accommodation of all existing differences.
On the 5th of May Sir Hyde Parker was recalled, and
Nelson invested with the command, which ought never to
have been for one moment intrusted to another. On the
8th he informed the Swedish admiral, by a flag of truce,
that although Sir Hyde Parker had consented not to in-
terrupt Swedish navigation, he, Lord Nelson, would act
against the Swedish fleet if he found it at sea; and he
left Captain Murray with six sail of the line, the Glatton,
and a frigate, to cruise off Carlsrona. On the 14th his
lordship anchored off Revel roads, prepared, if necessary,
to let Russia feel "the Nelson touch," under which Den-
mark and Sweden had quailed; but events had already
occurred in that country which changed the aspect of af-
fairs, and brought on an accommodation without any fur-
ther hostilities.¹

On the 23d of March the emperor Paul, who had per-
formed so versatile and extraordinary a part on the political
stage, from the period when he ascended the Russian throne,
expired suddenly. His capricious tyranny, which was at
last about to be directed against the members of his own
family, proved fatal to him, and he fell the victim of one
of those conspiracies to which despots are peculiarly expos-
ed. His son and successor, Alexander, immediately dis-
claimed all hostility against Great Britain, and made re-
paration for the damage which our merchants had suffer-
ed from the embargo laid upon their ships. A convention
was adjusted with Russia in the month of June, which put
an end to the dispute with the northern states, as Sweden
and Denmark could not of themselves hope to resist the
power of Great Britain; and by the third article of the
agreement it was stipulated, that effects embarked in neu-
tral vessels should be free, with the exception of contra-
band stores of war, and the property of an enemy; that
the latter designation should not include merchandise of
the produce, growth, or manufacture of the countries at
war, acquired by the subjects of the neutral state, and
transported on their account; that the commodities pro-
hibited should be such only as were declared contraband
by the treaty of commerce concluded between Great Bri-
tain and Russia in 1797; that a port should be considered
as under blockade when the ships of a belligerent power
should be so stationed as to render it evidently dangerous
to enter; that neutral vessels should not be stopped, ex-
cept upon strong grounds; that the proceeding should
be uniform, prompt, and legal; and that the right of
searching mercantile ships sailing under convoy of a ship
of war should only be exercised by the ships of the go-
vernment, not by those of private adventurers. By this
arrangement the chief points in dispute were settled in
favour of this country.

The war between France and Great Britain was now
reduced to merely maritime operations, and these were of
no great magnitude. One of the most important occurred
upon the coast of Spain, between Sir James Saumarez

¹ James's *Naval History of Great Britain*, vol. ii. p. 518, et seqq. London, 1822; Southey's *Life of Nelson*, vol. ii. p. 100, et seqq. London, 1813.

Reign of
George III.

and a squadron of French and Spanish ships of war. On the morning of the 6th of July, the British admiral stood through the Straits of Gibraltar, with the intention of attacking three French line-of-battle ships and a frigate, which were lying at anchor off Algeiras. On opening Cabrita Point he found that the ships lay at a considerable distance from the batteries on shore, and having the advantage of a leading wind, he conceived that he had every prospect of success. He had previously directed Captain Hood in the *Venerable* to lead the squadron; but the wind failing, this officer found it impossible to occupy the station assigned to him. Captain Stirling in the *Pompée*, however, having anchored opposite the inner ships of the enemy, commenced the action; while, in the ardour to engage, the *Hannibal* unfortunately ran aground. Every effort was now made by the admiral to cover this ship from the enemy's fire; but as she was only three cables length from one of the batteries on shore, he was obliged to retire, and to leave her in their hands. The loss on board the English squadron was considerable. The admiral had scarcely reached harbour when he was apprised that the French line-of-battle ships, disabled in the action of the 6th, were on the 8th reinforced by a squadron of five Spanish ships of the line under the command of Don Juan de Mozen, and a French ship of seventy-four guns; and that they were all under sail on the morning of the 12th of July, together with their prize the *Hannibal*. He had almost despaired of having a sufficient force in readiness to oppose such numbers; but by great exertion he was able to warp out of the Mole with all the ships under his command, the *Pompée* excepted, which had not time to get in her masts. The object of the British admiral being to intercept this powerful force on its way to Cadiz, he observed, late in the evening, that the enemy's ships had cleared Cabrita Point, and at eight he bore up after them. About eleven the *Superb* came up with the hostile squadron, and opened her fire at not more than three cables' length. At this critical period a mistake of the enemy decided the fate of the action. In the darkness and confusion, the Spanish ships fired upon each other; the *Real Carlos* took fire and blew up; whilst the *Hermenegildo*, mistaking her for an enemy, ran on board of her, and shared her melancholy fate; and the *San Antonio*, of seventy-four guns and seven hundred and thirty men, being thus left unsupported, struck to the *Superb*. The remaining ships of the enemy now crowded all sail and stood out of the straits; and at daybreak there appeared in sight only one French ship, which was standing towards the shoals of Cavil. But at this juncture the wind failing her, the *Venerable* was able to bring her to action, and had nearly silenced her when the loss of the mainmast obliged the captain of the *Venerable* to desist; and this ship, which was one of eighty-four guns, escaped along with the rest.

As the French had now resumed their usual menacing project of invasion, and appeared to be collecting a force in the harbour of Boulogne, an attempt was made by Lord Nelson to obstruct their preparations; and he succeeded in doing some damage, which appears to have encouraged him to make a more serious effort. Boats intended for boarding the French vessels were sent off in the night in four divisions, under the conduct of the Captains Somerville, Parker, Cotgrave, and Jones; and launches furnished with howitzers were detached under Captain Conn to join in the enterprise. Parker's division first approached the enemy, and commenced a furious attack, making strenuous efforts, with the most undaunted courage, and sanguine hopes of success. But an unforeseen obstacle baffled all their exertions. This was a very strong netting traced up to the lower yards of the French vessels, which were also

fastened by chains to the ground and to each other; and so effectual was the resistance of the enemy thus protected, that the crew of Captain Parker's boat were repulsed in their attempts to board a large brig, by a furious discharge of cannon and musketry, which killed a number of the assailants, while many more were wounded and maimed. The captain received a shot which carried off his leg and part of his thigh, and his boat would have been seized by the enemy, had not a cutter seasonably towed her off. In the mean time Somerville silenced the fire of a brig near the pier head; but so far from being able to bring her off, he found difficulty in securing the retreat of his own boats. Cotgrave, after a spirited attack, was deprived of the services of many of his men by a fire from the flotilla and the shore. And Jones felt so strongly the obstruction of the tide, that not being able to approach before the break of day, when the other captains were returning, he retired without making any hostile attempt. Captain Parker died of his wounds after the return of the fleet to the Downs. The number of British seamen killed and wounded on this occasion amounted to nearly two hundred.

Owing to the refusal of the former administration to ratify the capitulation of El Arish, negotiated between General Kleber and Sir Sidney Smith, the French still retained possession of Egypt. To remedy this unpardonable blunder a considerable force had been dispatched from Great Britain, under the conduct of an experienced and gallant officer, Sir Ralph Abercromby. The British forces under Lord Keith and General Abercromby, after unexpected delays on the coast of Asia Minor, arrived off Alexandria on the 1st of March; and the following day the fleet made sail for the bay of Aboukir, where it anchored. The sea continued to run high until the 8th, and no disembarkation could be effected; but on that day the first division made good their landing at ten o'clock in the morning, in the face of a body of French, who, evidently aware of their intention, were posted in force, with considerable advantage, on some sand hills opposite the landing place. The front of the disembarkation was narrow, and a hill which commanded the whole appeared almost inaccessible; yet the British troops ascended it under a fire of grape and musketry with the utmost intrepidity, and forced the French to retire, leaving behind them seven pieces of artillery, and a number of horses. The disembarkation was continued during that and the following day; while the troops which landed on the 8th advanced three miles the same day. On the 12th the whole army moved forward, and came in sight of the French, who were formed advantageously on a ridge, with their left resting on the canal of Alexandria and their right towards the sea. As it was determined to commence the attack on the 13th, the British force marched in two lines by the left, with an intention of turning the right flank of the enemy. But the attack was in some measure anticipated by the French, who descended from the heights on which they were formed, and assailed the leading brigades of both lines. The British troops were therefore compelled to change their front, which, though one of the most difficult operations in war, was executed with the greatest precision; and the rest of the army immediately followed their example. After a severe conflict, victory declared in favour of the English, though not without considerable loss.

The French commander-in-chief, Abdallah Menou, appears to have acted upon this occasion with but little judgment. Instead of bringing down nearly his whole force to the coast, which would have enabled him greatly to outnumber, and consequently, in all probability, to defeat the invaders, who were less acquainted with the country than his own officers, he thought fit to hazard an engagement on the 21st of March with only half his force. The battle commenced before day light in the morning, by a

sign of false attack on the left of the English under Major-general Craddock, in which the French were repulsed. But the most vigorous efforts of the enemy were directed against the right of the English army, which they endeavoured by every possible means to turn. The attack on this point was begun with great impetuosity by the French infantry, sustained by a strong body of cavalry, who charged in column. The contest was unusually obstinate. The French were twice repulsed, and their cavalry were repeatedly intermixed with the English infantry. While this was passing on the right, the French attempted to penetrate the centre of the British army with a column of infantry, who were also repulsed and obliged to retreat. A corps of light troops, however, advanced, supported by infantry and cavalry, to keep in check the left of the English, which was the weakest of the line; but all their efforts were fruitless, and the British remained masters of the field. The loss on our side was great, amounting in killed, wounded, and missing, to upwards of fifteen hundred. The loss of the French was calculated in the English accounts at three thousand. One of the French generals, Roiz, was killed, and Generals Lanusse and Bodel died of their wounds. A French regiment which had been styled invincible was destroyed in this battle, and its colours fell into the hands of a serjeant of the 42d regiment, called Sinclair, having, it is said, been picked up on the field by a Maltese, named Anthony Lutz. The victory of the 21st decided the fate of Egypt. In this battle, however, the British army suffered a great calamity in the loss of its general. This officer was at once beloved and esteemed by the soldiers whom he commanded; he preserved the strictest military discipline, while at the same time he secured the attachment of his troops by his obvious anxiety for their welfare. Early in the revolutionary war he had been employed on the Continent. He commanded the advanced guard in the action on the heights of Cateau, and he conducted the march of the guards from Deventer to Oldensaal in the retreat of the British troops in 1794. In the following years, till 1797, he commanded in chief in most of the successful enterprises of the British in the West Indies; and on his return to Europe he was invested with the rank of lieutenant-general, and appointed to the command of the forces in Ireland. In this station he made great efforts at once to protect the people and restore discipline to the army, both of which the violence of faction had induced the rulers of that country to neglect. Though a man of simple manners, yet he possessed great independence of character, and did not hesitate to express, in public orders, the indignation which he felt on observing the disorder and consequent misery which had been introduced into Ireland, by encouraging the licentious insolence of the troops towards persons accounted disaffected to the government; freely informing the army in that country that they were become formidable to every one but the enemy. In the expedition to Holland he displayed military talents which excited the admiration not only of his own army, but of the generals who were opposed to him.

After the death of Sir Ralph Abercromby, the command devolved upon General Hutchinson, who lost no time in proceeding towards Alexandria, where the principal force of the enemy was now concentrated. In the mean time the town and castle of Rosetta were taken by a division of the British army under Colonel Spencer, aided by a body of Turks. The French garrison, amounting to eight hundred men, made but a feeble resistance, and retired to the right bank of the Nile, leaving a few men killed and prisoners. While such was the state of affairs in the neighbourhood of Alexandria, Admiral Blakenet, with a considerable force from the East Indies, ef-

fecting a landing at Suez. The admiral had been separated from the rest of his squadron in the dangerous and difficult passage of the Red Sea; but before the end of April he was joined by a large reinforcement under the command of General Baird, who had with him Colonels Wellesley and Murray, and other officers of distinction.

As the capture of Grand Cairo, next to that of Alexandria, was a great object with the allies, a force was detached early in May for its reduction. On the 9th General Hutchinson, with four thousand British and an equal number of Turks, attacked the French near Rhamanieh; and the latter being driven in, retreated in the night towards Cairo, leaving a small garrison at Rhamanieh, which on the following day surrendered to the British. The loss of the English on this occasion did not exceed thirty men. About the same time a body of French and Copts, who had moved forward from Cairo to attack the Turks, were defeated by the grand vizier, who was essentially assisted by Colonel Murray and other British officers. The French are said to have lost fifty men, and the Turks about thirty in this action. The whole number of French engaged amounted to nearly five thousand, and the Turkish army to about nine thousand.

From various causes, it was the middle of June before the British army under General Hutchinson reached the vicinity of Cairo, where he found the works very much extended, though the garrison did not exceed five thousand in number. The capitan pasha at the same time invested Gizeh, a suburb of Cairo, on the left bank of the Nile, and the grand vizier took a position within cannon-shot of the city. Thus invested on every side, the garrison, on the 22d, sent a flag of truce to the English general, offering to treat for the evacuation of Cairo upon certain conditions. After a negotiation of several days, the surrender was finally agreed upon in a convention of twenty-one articles; the substance of which was, that the French army at Cairo and its dependencies were to be conveyed in the ships of the allied powers, and at their expense, together with their baggage, arms, ammunition, and other effects, to the nearest French ports in the Mediterranean; and of this convention General Menou was to be at liberty to avail himself. The port of Alexandria was all that now remained in possession of the French; it was attacked by sea and land, and at length surrendered by capitulation on the 2d of September.

By the time when intelligence of this event reached England, the views of men had been turned to a new state of things. Administration had seriously entered into negotiations for peace, which were conducted by Lord Hawkesbury on the part of Great Britain, and M. Otto, who resided in London as agent for the French prisoners of war, and who was now intrusted on the part of the French with this important business. The whole was managed with such secrecy, that not even persons who held official situations, except those immediately concerned, were acquainted with the state of the negotiation; and the lord mayor of London was the first person out of the cabinet to whom the result was communicated. Thus no unfair advantage could be taken; and this treaty stands almost singular on our records, since, at a period when the practice of gambling in the public funds was, from the wide extension of public credit, more predominant than at any previous crisis, not a single instance occurred of any sinister practice. By the preliminary articles, which were signed at London on the 1st of October, by M. Otto on the part of the French republic, and Lord Hawkesbury on the part of his Britannic majesty, Great Britain agreed to the restoration of all her conquests, the island of Trinidad and the Dutch possessions of Ceylon excepted. The Cape of Good Hope was to remain a free port to all

Reign of
George III.

the contracting parties, who were to enjoy the same advantages; the island of Malta was to be evacuated by the British troops, and restored to the order of St John of Jerusalem; Egypt was to be restored to the Ottoman Porte; the territory of Portugal was to be maintained in its integrity; the French troops were to evacuate the territories of Rome and of Naples; the republic of the Seven Islands was recognised by France; the fishery at Newfoundland was re-established on its former footing; and, finally, plenipotentiaries were to be named, and to repair to Amiens, in order to proceed with the arrangement of a definitive treaty of peace, in concert with the allies of the contracting parties. During the war, negotiations for peace had so repeatedly proved unsuccessful, that a general incredulity prevailed with regard to the possibility of such an event; and accordingly all merchants conducted their speculations upon the supposition that there existed no probability of an immediate termination to the war. The state of the present negotiation had been so carefully concealed, that, when the official intelligence of its issue was transmitted throughout the country, it excited everywhere the utmost astonishment, but nevertheless produced, almost instantaneously, the most unbounded expressions of joy among all orders of persons. The zealous adherents of the late administration, indeed, were upon the whole rather dissatisfied; but their voice was overwhelmed in the general exclamations which took place, and far surpassed the expressions of joy which had occurred at the termination of any former war; and, as an abundant harvest was at the same time reaped, the prospect of plenty added greatly to the public joy.

REIGN OF GEORGE III.—FROM THE PEACE OF AMIENS TO THE RENEWAL OF THE WAR IN 1803.

Meeting of Parliament.—Speech from the Throne.—The Peace impugned by Mr Windham.—Debates on this subject.—Definitive Treaty.—Suspicious conduct of Bonaparte.—Debates on the Definitive Treaty.—General Conduct of Administration.—Effects of the Change of Ministry.—Consequences of the Peace.—Conduct of the French Government.—French Expedition to St Domingo.—Abominable cruelty and oppression practised by the invading force.—Conduct of the French in Europe.—Despotism of Bonaparte.—The First Consul and the English Newspapers.—Meeting of Parliament.—Execution of Despard and his Associates.—Difficulties experienced in executing the Treaty of Amiens.—Bonaparte's Conversation with Lord Whitworth.—Transference of Louisiana.—Extraordinary Scene between the First Consul and the British Ambassador.—Ultimatum of the British Court.—War renewed.—Declaration in justification of the renewal of the War.—Situation of the Ministry.—State of Parties.—Menace of Invasion.—Preparations for encountering the threatened attack.—Patriotism of all classes.—The army, the militia, the army of reserve, and the volunteers.

Parliament assembled on the 29th of October. By this time the new administration, from the mildness of their conduct, and their successful negotiations for peace, had obtained a powerful hold on the affections of the public. When they first came into office they appeared to have obtained a promise of support from their predecessors; but this kind of gratuitous support could scarcely be expected to be very consistent or uniform. Mr Pitt himself continued to give countenance to the minister; but some of his friends avowed their dissatisfaction on account of the treaty with France. The speech from the throne announced the conclusion of the negotiations commenced during the last session of parliament; and expressed much satisfaction that the differences with the

northern powers had been adjusted. It stated that the preliminaries of peace had been ratified between us and the French republic; that whilst this arrangement manifested the justice and moderation of our views, it would also be found conducive to the interests of the country and the honour of the British character; and that as the provision for defraying the expenses of maintaining an adequate peace establishment could not be made without large additional supplies, all possible attention would be paid to such economical arrangements as were consistent with the security of his majesty's dominions. The speech concluded with applauding the operations of the last campaign, and particularly the glorious issue of the expedition to Egypt, which, however, has deserved and obtained a more fitting commemoration.

In the House of Lords the motion for the usual address passed unanimously. In the House of Commons, both Mr Fox and Mr Pitt declared that they joined in the general joy which the peace had produced, and gave it their approbation. On the other hand, Mr Windham differed as to there being any just cause for general joy and exultation; and he disapproved of the preliminaries of peace signed with France, as well as of the address, in as far as it implied an approbation of them. It behoved him to give his reasons for dissenting on so material a point. To stand as a solitary mourner in the midst of public rejoicings, to wear a countenance clouded with sadness whilst all others were lighted up with pleasure, certainly appeared ungracious. But were the circumstances of this peace such as justified our exultation upon former occasions? To him they appeared in a quite contrary view; and when he was desired to illuminate, he first endeavoured to learn whether it was to light him to a feast or a sepulchre. It was his firm persuasion, that in signing this peace his friends had put their signatures to the death-warrant of the country. He knew the inconsistency of human affairs, nor was he profane enough to set bounds to the dispensations of providence; but neither could he foresee what changes might be wrought in the disposition of the people of England by intrigues from without or convulsions from within; and upon no rational view could he see his way out of the evils it would entail upon this country. The only thing necessary to enable France to divide with us the empire of the seas was a participation of our commerce, and this she would effectually secure by the present peace; whilst, by the surrender of our conquests, we had thrown out of our hands the only means to prevent it, the extension of our colonial system. The motives which induced ministers to conclude these preliminaries, he knew not; some of them he had heard, but was not convinced, as they appeared wholly insufficient. If they were forced to accept this peace through inability, their conduct was the more excusable; and we had to thank them, not for what they had acquired, but saved to their country. If they could prove that, by ceding foreign colonies, they had preserved objects nearer and dearer to us, as Portsmouth, Plymouth, and Ireland, and the soil of England, from ravage and desolation, they were entitled to gratitude instead of censure, and had established, not a ground of apology, but a claim to thanks. But such a plea he did not recognise; and how far they were actuated by necessity, would be a matter for future discussion.

Mr Addington described the observations of Mr Windham as premature, since the articles of the treaty were not before the house; and, without referring to the terms of the peace, he affirmed, that all we had given up would have afforded us no sort of security against the dangers apprehended by Mr Windham, and that the best counterpoise to the power of France consisted in the preservation

of our constitution, in our industry and skill, and in the right direction of our resources. Mr Sheridan, notwithstanding the unanimity with which the address was consented to, believed, that if men sincerely delivered their opinions, there never was a period of less real unanimity. The peace had been spoken of as glorious and honourable. It was a peace of which every Englishman might be glad, but no one proud; and it involved a degradation of national dignity such as the war might lead us to expect, though perhaps it was as good as any minister could make in the circumstances in which we were placed.

His majesty having by message communicated the preliminary treaty with the French republic, an address of thanks was moved on the 3d of November, when Earl Spencer expressed his regret at differing in sentiment from the ministers, with some of whom it was his pride to have coincided in principles, and co-operated in conduct. The great object of Britain, in former wars with France, had been the preservation of the balance of power. This was the point which had been considered, from king William's confederacy against Louis XIV. to the present time; and to insure the maintenance of such an equilibrium, it was not only necessary that Britain should not be left by the peace in a worse political situation than in the beginning of the war, but that her strength, possessions, or acquisitions, should continue in proportion as high as those of France. In the present war, the acquisitions of France had been infinitely beyond all former conception; she had, by her arts or her arms, subdued the Netherlands, Holland, the left bank of the Rhine, and a great part of Italy; her power, compared with that of Great Britain, exceeded what she had been allowed to retain at any former treaty of pacification; nor could we be secure, when such immense acquisitions had been left to France, without anything like an equivalent left to this country. He therefore condemned the conditions of the peace now concluded, as of very great inequality, whether with reference to the relative state of France and the Continent, or to that of France and England. Lord Pelham thought that the terms of peace were the best which could be procured, even in favour of our allies. Portugal was safe, the Roman and Neapolitan territories had been released from the French yoke; the French were expelled from Egypt, by which our Ottoman ally had been saved; and with regard to Malta, its retention would have been more injurious than beneficial to England, as a powerful garrison would have been requisite for its protection. In the East and West Indies we had been triumphant by sea and land; and our possessions had received important additions by the conquests we had made. As to the security of the peace, we had every security which could be expected; and besides, it was the policy and interest of France to preserve it. Lord Grenville thought that, as Britain was in a prosperous state, we ought to have obtained more honourable terms of peace, because we were in a condition to demand them. It was far from his intention to undervalue the acquisitions of France; on the contrary, he thought them much more important than was generally esteemed. She had made the Rhine the boundary of the empire, and extended her territories beyond the ambition of her monarchs, having her frontiers protected by dependent republics and tributary kings. On our side we had triumphs no less brilliant and striking. We had multiplied our colonies, and our navy sailed the seas invincible; we had rescued Egypt, captured Malta, possessed ourselves of Minorca, and shut up the Mediterranean from the ships of France and Spain; the Cape of Good Hope, the key of the East, was ours; in the East Indies we had every thing except Batavia, which we might also have possessed had we thought it worth the cost of an expedition; in the

West Indies we had Martinico, Trinidad, and other islands; upon the continent of South America we had an absolute empire, in extent almost equal to that power to which we restored it. Such were the colonial possessions acquired by the war; and if Europe could not have been restored to her pristine state, these ought to have been retained as a counterpoise to the power of France. He denied the fairness of comparing the present treaty with that proposed at Lisle. We now gave up Surinam, Malta, and Minorca. At no time during the contest was the spirit of the country so depressed as at the negotiation of Lisle. A variety of causes combined to produce that despondency; the stoppage of the bank, the defection of our allies, and, above all, the mutiny in the fleet. The measure, therefore, was defensible on the score of necessity; but this was not the case at present; yet we had given to the French the only thing they wanted, the means of creating a navy, and of rivalling us in our commerce, while we had obtained nothing in return. The Earl of Moira was of opinion, that though the terms of the treaty were inadequate, they were unavoidable. Lord Nelson observed respecting Malta, that when he was sent down the Mediterranean, this island was in the hands of the French; and on his return from Aboukir, it was his first object to blockade it, because he deemed it an invaluable service to rescue it out of their possession. In any other view it was of no consequence, being at too great a distance from Toulon to watch the French fleet from that port; and in time of peace it would have required a garrison of seven thousand men, and in war as many more, without being of any real utility to us. The address was carried by a great majority.

When the same subject was discussed in the House of Commons, Lord Hawkesbury ascribed the origin of the war to the interference of France in the affairs of other nations; but the state of that country was now considerably amended, and it was impossible to look at the present condition of France without being convinced that we had at least effected this change. He then expatiated on the advantages we had gained, and the good faith we had maintained with our allies, releasing them from express stipulations when they were exposed to danger by continuing faithful to their engagements. With respect to Minorca, he did not consider that island as an acquisition worth retaining. Of Malta he spoke with less confidence, as, from its impregnable state, it was certainly of political consequence in the Mediterranean; but it was no source of trade and opulence; and, connected with the prosperity of the Levant, its consequence was considerably diminished. In a word, considering the results of the war, if the term glory were not taken into account, we had at least made an honourable peace; we had been engaged in a tremendous contest, and had come out of it, considering the circumstances, with advantage. Earl Temple considered those who had signed the peace as having signed the ruin of their country. Amongst the ill consequences likely to result from it, he lamented the encouragement given to republican principles; and as to the various ostensible objects of the war, not one of them had been accomplished. Mr Pitt said that it was undoubtedly the duty of government, in negotiations, to obtain the best possible terms; but it was difficult to know how far insisting on some lesser points might endanger the whole treaty; and he declared that he would rather close with an enemy on any terms not inconsistent with the honour of his country, than continue a war for any particular possession. He did not pretend to state that this peace fully answered all his wishes; but the government had obtained the best conditions they could, and the terms for which we con-

Reign of
George III.

Reign of George III. tended would not have justified ministers in protracting the war. Mr Fox declared himself satisfied with the terms of the treaty, and asserted, that no perseverance in the war would have enabled us to make peace upon better conditions. There were persons who lamented the peace as glorious for France; but if it were so, and not inglorious to England, it gave him no concern. The opinions of men depended in a great degree upon their conceptions of the causes of the war; if one of its objects was the restoration of the accursed despotism of France, to him it was another recommendation of the peace, that it had been obtained without the accomplishment of such an object. In the terms and tone of the present treaty he perfectly coincided. He approved the terms, and thought the noble secretary had wisely tempered firmness of conduct with moderation of tone; but further than this he could not go. He would by no means agree respecting the time in which the treaty was made: it came many years too late. He would put it to the house, whether, at the time the opposition was most railed against for advising pacific measures, we could not have made peace on terms equally advantageous with the present. Would not France, on the breaking out of the war, have acceded to any? Would she not then have relinquished Holland, and perhaps abandoned her designs on the Netherlands? But, since that eventful period, could we not have negotiated better after the surrender of Valenciennes; and again, at Lisle, when we only failed from the extravagant pretensions of administration? In January 1800, the first consul made a direct overture, and we returned an answer, that the most effectual mode of facilitating peace would be to restore the Bourbons. Did we hint then at the possession of Ceylon or Trinidad? Would not Bonaparte have added these? Yes, and the Cape into the bargain. We then might have had Egypt by the convention of El Arish. The gallant Abercromby, indeed, would not have fallen covered with laurels in the lap of victory, nor would our brave army have acquired immortal honour; but we should have gained Egypt without the loss of blood or treasure. The first consul might not perhaps have relinquished the Netherlands, nor the left bank of the Rhine; but in Italy he had only the Genoese territory, and we had nothing then to resist to the south-eastward of the Alps, and our allies were victorious on the frontiers of France. At that time the instability of the government operated with us; but neither its stability nor its instability were of any real consequence. None of the convulsions and changes of the French revolution produced any material difference in her relation with foreign powers. She had at the beginning made peace with Prussia, and sedulously preserved it during the stormy times succeeding its ratification. We were told by the ministers to pause, and we did pause from January 1800 to October 1801, and added seventy-three millions to our national debt since we returned that impertinent answer to the overtures of Bonaparte; and this pause cost five times as much as all the Duke of Marlborough's campaigns.

To negotiate the definitive treaty of peace, the Marquis Cornwallis went to Paris towards the close of the year, and thence proceeded to Amiens, where the negotiations went on very slowly, and were not concluded till the 27th of March 1802. The chief difficulty occurred with regard to Malta. But it was at last agreed that it should be restored to the knights of the order of St John of Jerusalem, under the protection and sovereignty of the king of Naples; that it should be under the guarantee of France, England, Russia, Spain, Austria, and Prussia; and that if the order should not have sufficient troops to defend the island, the guaranteeing powers should each contribute an equal portion of troops, the officers to be appointed by the grand

master. It was settled that Malta should be a neutral port, that one half of the garrison should be Maltese, and that there should be no French nor English body of knights, or tongue as it is called. The king of Naples, however, was to be invited to garrison the island with two thousand men for one year from the restitution of the knights; which was to take place in three months after the exchange of the ratifications of the treaty. In other respects the definitive treaty differed little from the preliminaries formerly agreed to.

During the dependence of the negociation, the first consul, Bonaparte, had taken some steps which indicated little moderation, and showed that it would be difficult to remain upon terms of amity with him, while the desire of extensive dominion which at present governed his councils seemed of too restless a character to allow much hope of tranquillity to the world. Without waiting till a definitive treaty of peace had been concluded, he sent a large army to St Domingo, which obliged Britain to dispatch a powerful fleet to the West Indies in order to watch its motions. On the Continent his measures were not less arbitrary. A considerable portion of Lombardy, with Milan as its capital, which had been erected into what was called the Italian or Cisalpine republic, and contained some millions of people, was now united to France, by the form of nominating Bonaparte to the office of president over it; a measure which at any other period would have involved all Europe in war: but at present no state ventured to interpose, and the British ministers finding no power in Europe disposed to resist this step towards the permanent aggrandisement of France, and being themselves anxious to restore peace, did not interrupt the negociations on this account.

On Thursday the 29th of April Lord Pelham, by his majesty's command, laid before the House of Lords a copy of the definitive treaty of peace between his Britannic majesty and the French republic, and his Catholic majesty and the Batavian republic, signed at Amiens on the 27th of March. Several debates occurred in that house upon the subject; and at length, on the 15th of May, Lord Grenville moved the order of the day for the house to take into consideration the definitive treaty. He remarked, that it might be asked of what use was discussion, now that peace was concluded? Was it to abrogate, could it correct the treaty? To this question he answered, that this unfortunate treaty had been ratified by his majesty, and was therefore irrevocable; to its terms, however injurious, we were bound to accede. By evasion we should but add disgrace to disaster, and with the loss of national honour fill up the measure of national calamity. He wished not to impede the execution of the treaty, but to demonstrate to that house its dangerous tendency; to ascertain the situation in which it left the country; to point out the perils which impended, and the safety which yet remained. His objections to the preliminary treaty he had already stated; but to the definitive treaty there were objections yet more formidable. The two bases of negociation, the *status ante bellum*, which signified the actual situation of the parties previous to hostilities, and the *uti possidetis*, which referred to their position during the pacification, had both been applied in the most prejudicial manner to this country. With regard to herself, England had adopted the *status ante bellum*; with regard to her rival, the *uti possidetis*. England had ceded her own conquests, and confirmed to France her new acquisitions. France possessed dominion on the Continent; we had, to oppose that dominion, the colonies of France and Spain. It would have been just that France should purchase our colonial by her continental sacrifices. He contrasted the definitive treaty with that of 1763. It had been an inviolable principle with Lord Chatham to make the prelimi-

Reign of George III. nary as much as possible the definitive treaty. Our negociators had treated with France during a naval armistice. Immediately subsequent to the preliminary treaty, France had sent an armament to the West Indies, and obliged England to destine for the West Indies also a naval force more than double any squadrons which had been sent during the war. The necessity of keeping in the West Indies thirty-five sail of the line was the first fruit of the peace. It was obvious that the definitive treaty contained concessions more important than the preliminary articles; and it was palpably the object of the French government to exclude the commerce of this country from the continent of Europe. With respect to the situation in which Portugal and the Prince of Orange were left by the treaty, it had been said that it was a pity, and that the articles were read with regret. The proposed indemnity to the Prince of Orange was evidently at the option of France; for the Cape of Good Hope, no effort had been made to insure its independence; and Malta, whose independence had been expressly stipulated, with the provision that it should be guaranteed by one of the powers of Europe competent to its protection, was finally placed under the guarantee of six powers, who never could be brought to agree on the subject of it. Its restoration to the order was nominal and futile. The order of Malta was virtually extinct; it would be subject to the nomination, the influence, and the dominion of France. He then proceeded to take a retrospective view of the situation of this country at the commencement of the negociation. With a colonial territory of an immense extent, we had, in the very conquests achieved by our arms, the means of perpetuating our victories. From the West Indies, the produce of which amounted to two millions annually, a considerable revenue had arisen, which was now lost. By our naval superiority we had controlled the movements of the French fleet; they were now at liberty to steer for the West Indies, and we were under the necessity of sending fleets to watch them. We were in possession of resources adequate to the prosecution of the war, and held in our hands the means of extorting a just and reasonable peace. Instead of improving these advantages, we had resigned to France the preponderance of power on the Continent, established her sway in Italy, and annexed to her important possessions in India. Even our right of sovereignty in India was no longer recognised. It had been suggested that this right was guaranteed by the silence of the definitive treaty; a mode of argument which appeared equally strange and singular. He affirmed that the sovereignty of the Cape was necessary to the safety of our territories in India, and instanced the war with Tippoo Sultan, when a corvette had been sent to the Cape, from which fresh troops were immediately dispatched, who landed, marched, and co-operated at the siege of Seringapatam. By ceding the Cape to Holland, we had ceded it to France. In the West Indies we had restored to France Martinique and Tobago, and facilitated the recovery of St Domingo. France was also mistress of Louisiana, and in reality of Florida, which could not, from its vicinity to Louisiana, remain subject to Spain; and she possessed the key of Mexico, which she might enter at any period. If we turned to the Mediterranean, it would be impossible to send a single ship there without the permission of France. We were stripped of Majorca, Minorca, and even of the island of Elba; we were excluded from Leghorn, and deprived of the means of maintaining a fleet in that sea; the king of Sardinia could no longer open to us his ports. The victory obtained by Lord Nelson at Aboukir was to be attributed to the assistance rendered by the king of Naples; and in return for these services, the British government had stipulated that the French republic should evacuate his dominions,

without stipulating that they should not return to them. In short, whatever the valour of the British navy had won, the incapacity of the British ministry had lost. Reign of George III.

The Duke of Norfolk expressed his hope, that, now the sword was restored to its scabbard, it would not again be unsheathed for the acquisition of a station in the Mediterranean. Lord Auckland, in reply to Lord Grenville, stated, that it was an error to hold that all treaties between nations were annulled by war, and that, to be reinforced, they must be specially renewed on the return of peace. It was true, that treaties, in the nature of compacts and concessions, the enjoyment of which has been interrupted by the war, were thereby rendered null; but compacts which were not impeded by the course and effect of hostilities, such as the rights of a fishery on the coasts of either of the belligerent powers, the stipulated right of cutting logwood in a particular district, were not affected by war. There were also circumstances which might authorize the dissolution of treaties, without any rupture between the two parties. It had therefore been observed by Vattel and other writers, that treaties cease whenever an essential alteration in either of the contracting parties takes place. Applying this doctrine to Savoy, Switzerland, and other countries, the temporary victims of the French revolution, he admitted that the definitive treaty contained not a single provision, direct or indirect, for the renewal of treaties which had subsisted previous to the war; but it was not true that, by the non-renewal of our treaties with Holland, the vessels of that republic would be exonerated from the ancient practice of striking their flag to British ships of war in the British seas; for that practice had existed independently of the treaty of 1782, or even of the treaty of Breda in 1767, which were only recognitions of a previously admitted claim. The same remark was applicable to the sixth article of the treaty of 1764, by which the states-general promised not to obstruct the navigation of British subjects in the Eastern seas. That article was no new grant, but an acknowledgment of a right, and a notification to merchants that they would not be disturbed in the exercise of that right. With respect to France, the commercial treaty of 1786 had expired, but not till it had reached the natural era of decay; nor would he feel solicitude for its resuscitation, unless our negociator at Amiens should prove that the French manufacturers were able, in 1802, to resume the competition to which they were unequal, in 1786, under the existing tariff. With regard to our sovereignty in India, it had been confirmed and extended by various treaties, recognised by all the powers of Europe and India who had accepted privileges from us, and finally established by undisturbed possession. On the contrary, Lord Carnarvon represented the treaty as pregnant with danger to the country. It had been hoped, that some articles relative to our allies, and involving our own national honour, would be altered; but the definitive treaty, instead of realizing, had annihilated these hopes; concession was heaped on concession, and disgrace on disgrace. By omitting to renew former treaties, ministers had unadjusted all former adjusted disputes, and, without the customary acknowledgment of our rights, had left us to the honour and justice of France. Lord Ellenborough expressed much surprise that the non-renewal of treaties should have been urged as a serious objection to the definitive treaty. To what purpose was this solemn nonsense to be revived? Were not these treaties replete with articles wholly inapplicable to the present political state of Europe? For himself, he could as well think of the revival of the condition of mankind, in some remote period, as of the ancient treaties, which had become inapplicable and obsolete. Our sovereignty in India rested on the rights of conquest in legitimate war, upon the repeated recognition

Reign of George III. of all the powers of Europe, and on the best of all rights, possession.

The same subject, after being repeatedly alluded to, was finally discussed in the House of Commons on the 13th of May. Mr Windham attacked the treaty in several of its prominent parts. With regard to Malta, he contended, that it must ultimately fall into the hands of the French. The little order of Malta, which contained in itself the great characteristic and distinctive qualities which the French revolution had subverted, was now destroyed. The German knights had already refused to serve in a body so degraded and debased; the Neapolitan soldiers would form no security for the independence of the island; the state of Malta was a virtual surrender, and our position in the Mediterranean untenable. The Cape of Good Hope was ceded, in full sovereignty, to the Dutch, who were thus at liberty to resign it to France. Our Indian empire was our sheet anchor; and whatever was necessary for its preservation was of the last importance. The disadvantages upon our side he then contrasted with the advantages in favour of France. By the restitution of Cochin China to the Dutch, they had acquired the means of annoying our possessions in the East Indies. In defining the boundaries of France and Portuguese Guiana, ministers had enabled France to obtain her great object, the navigation of the river Amazons; and the Portuguese settlements were left exposed to the foe. He deplored the cession of Louisiana to France, which, considering the almost indefinite extent of Guiana, was a surrender of the two greatest rivers in the world; the Mississippi in the north, the river of Amazons in the south of America. In aggravation of this thoughtless prodigality, ministers had abandoned the whole continent of Europe to France. We already knew the French too well to doubt that they would scruple what means they used to accomplish their ends. Had they not fraudulently obtained the restitution of Porto Ferrajo to the king of Etruria, in order to secure it to themselves? Regardless of stipulations and treaties, they had seized on the island of Elba; and, to bestow a compensation on the king of Etruria, had extorted Piombino from Naples. The French were a new race of Romans; and in ten years they had even acquired more than the Romans were able to achieve in fifty-three. On the map of Europe two nations only stood erect; and of these, the one from distance more than from strength. Austria was indeed still rich in resources, but destitute of foreign aid. There was no single power which could enter the lists with France. In the first conflict it would be crushed by her tremendous mace. He repeated, that we had given away two continents, and that the object of France obviously was the attainment of universal empire. He admitted that the peace must be observed, now that it had been entered into; but concluded with a motion for an address, expressive of disapprobation of it.

Lord Hawkesbury observed, that from some observations of Mr Windham's, it would seem that whenever any continental power, however unconnected with us, became involved with France, it was our duty to volunteer our interference and assistance. That we were deeply interested in the destiny of the Continent, he was willing to admit; but he conceived our interference with its commotions to be optional, neither instigated by necessity nor extorted by honour. At the end of nine years of war, we had found ourselves deserted by our allies; and with the first intimation which his majesty's ministers received of the new constitution of the Italian republic, they had heard of its acceptance by the courts of Vienna, Berlin, and Petersburg. Under these circumstances, he submitted, whether it was incumbent on us to continue the war on account of the Italian republic. The cession of Louisiana by Spain to France

was another ground of complaint. That province had originally been a French colony, when the Mississippi was the boundary between it and Great Britain; and it had been ceded by France to Spain, in a private convention, between the preliminaries and the definitive treaty of 1763; a proof that conventions of this nature, if not right, were at least not new. The value of Louisiana was at present only nominal; as a naval station it was allowed to be insignificant; and its vicinity to America was calculated to diminish, rather than augment, the attachment of that country to France. Concerning the non-renewal of certain treaties and conventions, he observed, that the principle on which treaties had usually been renewed appeared not to be understood. The treaty of Westphalia formed a distinct era in the history of Europe; and in order to ascertain the relative situations of the different powers, it had been customary to renew that treaty, together with any particular conventions subsequent to it. But it was to be considered, that formerly all preceding treaties had been renewed by the other powers of Europe, whereas in the present war no European power had done so; and consequently, if we had renewed former treaties, we only should be bound whilst other nations were free. By renewing former treaties, we should have been forced to sanction all the recent encroachments of France; and by sanctioning the treaty of Luneville we should have been accessory to the dismemberment of the Germanic empire. His lordship represented the definitive treaty as coinciding with the preliminary treaty which had previously received the sanction of the house. In regard to the permanence of the peace, he was willing to admit, and to deplore, that, in the present state of the world, any peace must be insecure; but the precarious tenure on which this blessing was to be held formed no reason for rejecting it. He concluded with moving an address to his majesty, to testify the satisfaction of the house on the conclusion of the definitive treaty. Mr Dundas also opposed Mr Windham. In his judgment, however, the Cape and Ceylon formed our two great bulwarks, and he never would have consented to the surrender of the former. The cession of Malta was also to him a subject of equal regret; and to the relinquishment of either of those places he should have refused his assent had he continued in administration. But he would not support the address moved by Mr Windham, because it contained an invective against the peace. Sir William Young contended, that when a standing army was deemed essential to the preservation of peace, it was proper that the people should be informed of the state of affairs which justified such a measure. Lord Castlereagh remarked, that our grand object, from the commencement to the close of the war, had been the establishment of general security; and that the gradual extinction of jacobin principles, and the gradual restoration of order and tranquillity, had been given as sureties for the peace. With regard to the territorial acquisitions of France, they might eventually become of infinite importance; but they were not pregnant with immediate mischief, and could only be the sources of distant danger. Mr Addington desired not that the treaty should be praised; he had never regarded it with sentiments of exultation, nor lavished on it panegyric; he was content that the honour of the country was unsullied by the measure which had been adopted. He acknowledged that the territorial acquisitions of France could not be viewed without regret; but there were events which we could not control, and dispensations in which we must acquiesce; and he should rejoice to see the resources of this country economized by peace. Mr Sheridan treated the subject with some gaiety. He said he supported the peace, because he was convinced that ministers could obtain no better; their predecessors

had left them to choose between an expensive, bloody, fruitless war, and a hollow, perilous peace. He attacked the new oppositionists, who had been supporters of the former administration, and demanded, for what did we go to war? Why, to prevent French aggrandisement: Have we done that? No. Then we are to rescue Holland: Is that accomplished? No. Brabant is the *sine qua non*: Is it gained? No. Then come security and indemnity: Are they obtained? No. The late minister told us, that the example of a jacobin government in Europe, founded on the ruins of a holy altar, and the tomb of a martyred monarch, was a spectacle so dreadful and infectious to Christendom, that we could never be safe while it existed, and could do nothing short of our last effort for its destruction. For these fine words, which had at last given way to security and indemnity, we had laid out near two hundred thousand lives, and nearly three hundred millions of money—and had gained Ceylon and Trinidad. But one grand consolation remained. Bonaparte was to be the extirpator of jacobinism; the champion of jacobinism was to become a parricide; the child of sin was to destroy his mother; he had begged pardon of God and man, piously restored bishops with the salaries of curates, and penitently extorted of them a solemn oath to turn spies and informers in his favour. It had been said, that France must have colonies to be afraid of war; that that is the way to make Bonaparte love peace. He has had, to be sure, a rough military education; but if you put him behind the counter a little, he will mend exceedingly. When he was reading the treaty he thought all the names of foreign places, Pondicherry, Chandernagore, Cochin, Martinico, all cessions. No such thing; they are so many traps or holes to catch this silly fellow in, and make a merchant of him. At this moment, nobody in Britain knew who was minister, as the present ministers continued to identify themselves with the former. Of the late minister, he said that none more admired his splendid talents than he did. If ever man was formed to give lustre to his country, he was that man. He had no low, little, mean, petty vices; he had too much good sense, taste, and talents, to set his mind upon ribbands, stars, and titles; he was not of a nature to be the tool and creature of any court. But great as were his talents, he had misapplied them in the politics of this country; he had augmented our national debt, and diminished our population. He had done more to abridge our privileges, and to strengthen the crown at the expense of the constitution, than any minister he could mention. He concluded by moving, as an amendment to Lord Hawkesbury's address, that it was the opinion of that house, that the omission of various opportunities of negotiating peace with advantage to this country, more especially the rejection of the overtures made by the first consul of France in January 1800, appeared to have led to that state of affairs which rendered peace so necessary as to justify the painful sacrifices which his majesty had been advised to make for the attainment thereof. But the address proposed by Lord Hawkesbury was carried by a very great majority.

During this session of parliament the most important operation of finance consisted of the repeal of the tax upon income, which gave great satisfaction. Indeed, in their whole conduct administration conducted themselves with a degree of moderation and prudence which greatly conciliated towards them the minds of the public. On all occasions they defended the former ministry against the attacks of the old opposition; and, in return, they were supported by a very considerable number of the members of that administration, including Mr Pitt. At the same time they did not appear unwilling to enter into political connections with the members of the old opposition. Par-

liament was prorogued on the 28th of June, and dissolved on the following day. The elections which immediately succeeded exhibited the singular spectacle of an administration which avoided interfering in the choice of the members of parliament. The members and friends, however, of the old administration, together with their opponents, were abundantly active.

The effect of the change of ministry had by this time been very sensibly felt over the whole of the island. During the preceding ten years the minds of men had, in a greater or less degree, been kept in a state of constant alarm from the fear of plots and conspiracies against the government, and from the apprehension that a most dangerous disaffected party was at all times ready to burst forth into action, and that the British constitution was only preserved in consequence of the suspension of the *habeas corpus* act and other legislative restraints, aided by the extreme vigilance of administration, and of their friends, in repressing disaffected persons. Hence society existed under a sort of general apprehension and distrust; and persons originally unfriendly to the war suffered in all departments of business, and in every quarter of the country, no inconsiderable degree of political persecution. All this had now passed away. The new ministers suffered the penal and restraining laws quietly to expire, and the constitution to depend for support upon its own strength and the ancient provisions of the law; they gave themselves no trouble about the general sentiments of the people with regard to speculative subjects, and seemed desirous to conciliate the good will of all orders of the state. The consequence was, that the fears and anxieties which formerly existed about the safety of the constitution passed away like a dream; a universal attachment to the institutions of the country sprung up; and political animosities, being no longer fed by alarms artfully excited by the government, were, as if by a sort of enchantment, appeased and forgotten.

With regard to the effects of peace upon the British and French nations, these promised at first to prove favourable to the general interests of humanity. The French had successfully defended their own independence, and in their turn assailed those by whom it had been menaced, with such a persevering energy as secured to them a portion of respect from the British nation; whilst, on the other hand, the maritime triumphs of Britain had been so splendid, and the valour of her troops in Egypt so distinguished, as to secure to this country a high degree of consideration in the eyes of the French. The people of the two countries accordingly seemed eager to unite in habits of the most amicable intercourse; considerable numbers of Frenchmen came over to Britain; and multitudes of persons of all ranks hastened from Britain to visit a country which had of late years excited, in so remarkable a degree, the attention of all the nations of Europe, and had been the scene of such extraordinary transactions. On this reciprocal tendency of the two nations to abandon their animosities, a system of commercial intercourse might have been reared of a nature much more simple and perfect than that which had been created by Mr Pitt's treaty; and there is no reason to believe that any disposition existed, on the part of the British government, to stand aloof from France, or to avoid, for any political reason, the extension of our commerce with that country. Such an intercourse would have proved favourable to France in every possible way. It would have enabled her people to derive considerable assistance from the capital of British merchants, which would have been rapidly and liberally advanced towards promoting the culture of their most valuable productions; and even in a political point of view France must have been aggrandised by such a connection.

Reign of George III. What she wanted was a navy to defend her colonies, and to enable her to cope with Britain in the event of a future war; and this advantage she could only obtain by means of commerce, more especially with Britain.

But it soon appeared that a man may be qualified to lead armies successfully to battle, to overrun provinces, and to attain the envied title of a conqueror, who at the same time possesses but a moderate portion of magnanimity, self-command, or knowledge of the maxims of sound policy and the best interests of nations. The French government, instead of seizing the opportunity thus afforded of encouraging the people to become commercial and acquire wealth, and seeking to form a maritime power by opening their ports, and holding out to Britain a commercial treaty arranged on liberal principles, shut their harbours more closely than during the most violent period of the war. Vainly fancying that in this way they would enable their own manufacturers to rival those of Britain, they in fact only excluded their wines from the British market; and by thus losing a sure and ready mode of attracting riches to their country, they prevented the acquisition of capital by enterprising individuals, and ruined the very industry which they intended to encourage and promote. They idly thought that they were in this way limiting the trade of Britain, which, having all the rest of the world open to its efforts, could not be injured; and, in truth, by their narrow views and illiberal policy they only injured themselves. By similar miscalculation, or from a restless spirit of ambition, the French government sought aggrandisement by those efforts of violence which are only tolerable in the midst of war, but which in peace justly excite the jealousy and indignation of mankind.

One of the first enterprises of Bonaparte, in consequence of the peace, was an attempt to reduce under his power the island of St Domingo. During the revolution that great and fertile island had suffered the most severe calamities, which had terminated in the emancipation of the negroes; and the latter had formed themselves into a sort of regular government, at the head of which was one of their own race, Toussaint-Louverture, a man of humanity, and possessed of considerable talents. Reports were circulated in Europe that he wished to render St Domingo independent of France; but of this there is no proof, and it is probable that his chief offence consisted in the general estimation and personal consequence to which he had attained, and that the despotic spirit of Bonaparte could brook no appearance of independence or rivalry in any part of the French territory. Nor was it unnatural that, under a military government, force should have been employed in preference to any method of conciliation. At the end of the year 1801 an army of twenty-five thousand men was sent to St Domingo; and as single ships and small squadrons continued to sail during the winter, loaded with troops, it is believed that nearly forty thousand men were employed in what might be called the first division of the expedition. The accounts of their proceedings are very defective; but, from all that has transpired, the conduct of the French appears to have been extremely disgraceful. The negro chiefs having refused unconditional submission, they were attacked, and defeated in several battles; and disunion, as usual, following disaster, Toussaint was at last induced to enter into negotiation. The terms of the treaty were concealed; but, as he was still at the head of a respectable force, it is believed that not only the possession of his personal freedom, but the undisturbed enjoyment of his property, was secured to him, and that his followers were promised a full indemnity. This occurred in the beginning of May 1801. The French general, Le Clerc, brother-in-law of the first consul, no sooner found the negro chief in his power, and the tran-

quillity of the colony apparently re-established, than he committed one of the basest acts of treachery that ever disgraced a government. The abdicated general was accused of a conspiracy, though it was evident that from the period of his submission to that of his seizure he had not had time to meditate, much less to organize, such a measure; and on the 12th of May Toussaint and his whole family were put on board a frigate, and shipped off for France, where he soon died of a broken heart in a prison. The negroes perceived that they were deceived and betrayed; and as an attempt was made to reduce them again into a state of slavery, after they had enjoyed freedom for several years, no doubt could remain as to the real object for which the expedition had been fitted out. The chiefs who had been prevailed on to desert Toussaint, and whose desertion had led to his surrender, now justly fearing that they were destined to share the miserable fate of their deluded associate, betook themselves to flight;—the whole island revolted;—pestilence came in aid of these avengers of tyranny and falsehood;—and the miserable instrument of the first consul's cruelty fell himself the victim of the climate. After a series of horrors and atrocities, even darker and deeper than those which blacken the memory of Robespierre, Marat, St Just, and Carrier, and which will for ever remain a disgrace to the French character, the republic had to regret the loss of sixty thousand of her best troops, in a vain attempt to subdue a colony which might, with temper and humanity, have been conciliated and retained.

In Europe the conduct of the French government was scarcely less arbitrary. The whole fortresses of Piedmont were dismantled, and that country was ultimately annexed to France; and the duchy of Parma and Placentia was treated in the same way. Meanwhile the Swiss, whose form of government had been altered in imitation of that of France, wished to restore the ancient constitutions of the cantons, under which their ancestors had prospered during so many ages. But their present leaders, who had risen to power under the protection of France, solicited the interference of Bonaparte in their favour; and he accordingly sent a numerous army against Switzerland, and, notwithstanding the remonstrances of the British court, placed the sovereignty in the hands of his own dependents or adherents. After all their struggles for freedom, the French nation also submitted to a confirmed military despotism. When Bonaparte assumed the appellation of first consul, it was under the declaration that the office, in terms of the constitution then promulgated, was to endure for only ten years. But this constitution was now altered, and the assent of the people being demanded to a new one, by which Bonaparte was to remain consul for life, and even to possess the power of nominating his successor, suffrages in favour of this measure were obtained to the number of between three and four millions. The event was celebrated with the greatest magnificence in Paris; and addresses of congratulation were presented from the different courts of the continent of Europe, and even from the emperor of Germany.

These transactions could scarcely fail to be noticed in Britain, and to become the subject of animadversion in the public newspapers. In fact the unprincipled ambition of Bonaparte, and the degraded character and state of the French nation, formed topics of frequent discussion in the public journals, and were criticised with unexampled severity. Even the personal character of the first consul was not spared; and it cannot be denied that he was often libelled in the grossest manner. Bonaparte appears to have early become sensitive and irritated on this head. The English, owing to their political freedom, had long boasted of their superiority as a people over their en-

Reign of
Geo. III. of slaved neighbours of France; and the first consul, no doubt, dreaded lest the vanity of his subjects should be wounded by continual representations, coming from the free press of England, of the degraded state into which it was alleged they had fallen. A great degree of irritation was thus produced in the French government against England; and the first consul even went so far as not only to prohibit the importation of English newspapers into France, but to demand from our government that the best bulwark of British freedom should be destroyed, by imposing restrictions upon the liberty of the press. He was even weak enough, through the medium of the French official journal, to commence a contest of argument, eloquence, and vituperation, against the writers of English newspapers. But in such a warfare he could not fail to be beaten; because they had nothing else to do but to write; and because the obscurity of their situation as individuals enabled them to inflict deep wounds without fear of reprisals. Newspaper writers also had much to gain by the contest, and certainly could wish for nothing more favourable to their interests, than to be enabled, during a dull, monotonous period of peace, to render their lucubrations interesting, and to amuse their readers by engaging in a paper war with Bonaparte. These circumstances, however, added to the restless ambition of this wonderful person, and his obvious want of discernment as to the true interests of France, or of patience to pursue them, left but little reason to hope that the peace so recently concluded would be of any long duration.

The new parliament assembled on the 16th of November, and Mr Abbot was chosen speaker of the House of Commons. On the 22d, his majesty, in a speech from the throne, after congratulating the country on the abundant harvest, remarked, that the state of the manufactures, commerce, and revenues of the united kingdom was flourishing beyond example; that the loyalty and attachment which were manifested to his person and government afforded the strongest indication of the just sense entertained of the numerous blessings enjoyed under the protection of our happy constitution; that, in his intercourse with foreign powers, he had been actuated by a sincere disposition for the maintenance of peace; that nevertheless he could not lose sight of that established and wise system of policy by which the interests of the other states were connected with our own, or be indifferent to any material change in their relative condition and strength; that his conduct would be invariably regulated by a due consideration of the actual situation of Europe, and a watchful solicitude for the permanent welfare of his people; and that he would not fail to adopt those means of security which were best calculated to preserve to his subjects the blessings of peace. In both houses the usual address was agreed to unanimously and without debate.

About this time Colonel Despard, and six persons of low rank, were executed for high treason. Despard was an Irishman, and of good family. Having long been under close confinement during the late administration, on suspicion of entertaining criminal designs against the government, his imagination, while under seclusion from society, had become inflamed nearly to madness; and after his liberation, in consequence of the *habeas corpus* act being no longer suspended, he had associated with a number of mean persons, whom he had induced to imagine that they were capable of overturning the government and altering the constitution. They accordingly took an oath to this effect, and agreed to attack the king at the meeting of parliament, to seize the Tower and the bank, and to incite a general insurrection. But their wild scheme was discovered, and their criminal engagements being fully proved, they were convicted and executed.

In the meanwhile some difficulties occurred in the execution of the treaty of Amiens. The British ministry had avoided engaging in a quarrel with Bonaparte on account of his continental usurpation, because they found no power willing to join them in resisting him; but his restless ambition induced him to endeavour to lay hold of the island of Malta; and his impatient spirit prevented his conducting the plan in such a manner as might have enabled him to avoid suspicion and insure success. That island was destined by the treaty to be intrusted to the order of St John of Jerusalem. Without waiting till the British had abandoned it, Bonaparte instantly set on foot negotiations with the different countries to which the knights of the order belonged, to procure the abolition of the order, the confiscation of its revenues, and the prohibition of the future enrolment of knights, and their departure for Malta. And having accomplished these objects, he required the British government to deliver up the island to a grand master, appointed, at his instigation, by the pope; or to the king of Naples, who was to receive possession, in the first instance, for behoof of the knights. Strictly speaking, there was thus no longer any order of Malta to defend the island; and as the king of Naples was at all times at the mercy of France, the evacuation of Malta by the British troops would, in the actual posture of affairs, have been equivalent to the transferring it to the latter power. The British ministry had submitted to the late continental acquisitions of France from want of means to oppose them; but they resolved to oppose the seizure of this island, which may be considered as the key of the Mediterranean, because the superiority of the British fleet enabled them successfully to do so. This determination appears to have greatly perplexed the vehement and irritable mind of the first consul. No successful resistance had hitherto been offered to any of his continental enterprises; and as the attempt now made to refuse delivery of the island to the king of Naples, and the nominal grand master of the order of St John, could only be justified by accusing him of having acted fraudulently against the spirit of the treaty, so an acquiescence on his part in the retention of the island, contrary to the express stipulations of the treaty of Amiens, would have been equivalent to a confession of guilt. In this situation he found himself detected in a deceit which he was unwilling to acknowledge; whilst, at the same time, he suffered the additional mortification of having sacrificed his reputation without any profit in return, the irresistible power of the British navy rendering it impossible for him to seize Malta by force. In this dilemma, a conversation occurred between him and the British ambassador Lord Whitworth, which, as the fortunes of Bonaparte have been so extraordinary, it may be worth while to record, in the terms in which it was reported to the British court. In a letter to Lord Hawkesbury, dated the 21st February, Lord Whitworth says:—

"I received a note from M. Talleyrand, minister for foreign affairs, informing me the first consul desired to converse with me, and that I would come to him at the Thuilleries at nine o'clock. He received me in his cabinet, with tolerable cordiality; and after talking on different subjects for a few minutes, he desired me to sit down, as he himself did on the other side of the table, and began. He told me that he felt it necessary, after what had passed between me and M. de Talleyrand, that he should in the most clear and authentic manner make known his sentiments to me, in order to their being communicated to his majesty; and he conceived this would be more effectually done by himself, than through any medium whatever. He said that it was a matter of infinite disappointment to him, that the treaty of Amiens, instead of being followed by conciliation and friendship, the natural effects

Reign of George III. of peace, had been productive only of continual and increasing jealousy and mistrust; and that this mistrust was now avowed in such a manner as must bring the point to an issue. He now enumerated the several provocations which he pretended to have received from England. He placed in the first line our not evacuating Malta and Alexandria, as we were bound to do by treaty. In this he said that no consideration on earth would make him acquiesce, and of the two, he had rather see us in possession of the Fauxbourg St Antoine, than Malta. He then adverted to the abuse thrown out against him in the English public prints; but this, he said, he did not so much regard, as that which appeared in French papers published in London. This he considered as much more mischievous, since it meant to excite this country against him and his government. He complained of the protection given to Georges, and others of his description, who, instead of being sent to Canada, as had been repeatedly promised, were permitted to remain in England, handsomely pensioned, and were constantly committing all sorts of crimes on the coasts of France, as well as in the interior. In confirmation of this, he told me that two men had within these few days been apprehended in Normandy, and were now on their way to Paris, who were hired assassins, and employed by the Bishop of Arras, by Georges, and by Duthiel, as would be fully proved in a court of justice, and made known to the world. He acknowledged that the irritation he felt against England increased daily, because every wind (I make use as much as I can of his own ideas and expressions) which blew from England brought nothing but enmity and hatred against him. He now went back to Egypt, and told me, that if he had felt the smallest inclination to take possession of it by force, he might have done it a month ago, by sending twenty-five thousand men to Aboukir, who would have possessed themselves of the whole country, in defiance of the four thousand British in Alexandria. That instead of that garrison being a means of protecting Egypt, it was only furnishing him with a pretence for invading it. This he would not do, whatever might be his desire to have it as a colony; because he did not think it worth the risk of a war, in which he perhaps might be considered as the aggressor, and by which he should lose more than he could gain, since, sooner or later, Egypt would belong to France, either by the falling to pieces of the Turkish empire, or by some arrangement with the Porte. As a proof of his desire to maintain peace, he wished to know what he had to gain by going to war with England. A descent was the only means of offence he had, and that he was determined to attempt by putting himself at the head of the expedition. But how could it be supposed, that after having gained the height on which he stood, he would risk his life and reputation in such a hazardous attempt, unless forced to it by necessity, when the chances were that he and the greatest part of his expedition would go to the bottom of the sea. He talked much on this subject, but never affected to diminish the danger. He acknowledged that there were a hundred chances to one against him; but still he was determined to attempt it, if war should be the consequence of the present discussion; and such was the disposition of the troops, that army after army would be found for the enterprise. He then expatiated much on the natural force of the two countries. France with an army of four hundred and eighty thousand men (for to this amount it is, he said, to be immediately completed), all ready for the most desperate enterprises; and England with a fleet that made her mistress of the seas, and which he did not think he should be able to equal in less than ten years. Two such countries, by a proper understanding, might govern the world, but by their strifes might

Reign of George III. overturn it. He said, that if he had not felt the enmity of the British government on every occasion since the treaty of Amiens, there would have been nothing that he would not have done to prove his desire to conciliate; participation in indemnities as well as in influence on the Continent, treaties of commerce, in short, any thing that could have given satisfaction, and have testified his friendship. Nothing had, however, been able to conquer the hatred of the British government, and, therefore, it was now come to the point, whether we should have peace or war. To preserve peace, the treaty of Amiens must be fulfilled; the abuse in the public prints, if not totally suppressed, at least kept within bounds, and confined to the English papers; and the protection so openly given to his bitterest enemies (alluding to Georges, and persons of that description) must be withdrawn. If war, it was necessary only to say so, and to refuse to fulfil the treaty."

The result of this conversation, and of some circumstances in the conduct of the French, was, that on the 8th of March, the following message was addressed by the king to the House of Commons. "His majesty thinks it necessary to acquaint the House of Commons, that as very considerable military preparations are carrying on in the ports of France and Holland, he has judged it expedient to adopt additional measures of precaution for the security of his dominions. Though the preparations to which his majesty refers are avowedly directed to colonial service, yet as discussions of great importance are now subsisting between his majesty and the French government, the result of which must at present be uncertain, his majesty is induced to make this communication to his faithful Commons, in the full persuasion, that while they partake of his majesty's earnest and unvarying solicitude for the continuance of peace, he may rely with perfect confidence on their public spirit and liberality, to enable his majesty to adopt such measures as circumstances may appear to require, for supporting the honour of his crown, and the essential interests of his people." On the motion of Mr Addington, the house voted an address, agreeing unanimously to support the crown in the measures proposed. It speedily appeared that the preparations which had been alluded to in the king's message were extremely trifling indeed. Bonaparte had obliged the Spaniards to cede to him the sovereignty of Louisiana; and an armament, with about four thousand troops, was now preparing to leave the ports of Holland to take possession of the territory thus acquired. The government of the United States opposed this measure; and the state of Kentucky sent notice to the president that ten thousand volunteers had enrolled themselves, and were resolved, with or without the aid of the union, to resist the settlement of the French in their neighbourhood. Meanwhile Bonaparte, who probably had no serious intention of effecting such a settlement, sold for a sum of money to the United States of North America the territory of Louisiana; a country inhabited by many independent tribes of savages, and to which, upon the principles of natural justice, neither he, nor the Spaniards, nor the Americans, had any right. But the inhabitants of Europe, and even the Transatlantic race of Europeans, had now for some ages been accustomed to regard all foreign countries as unoccupied property, which they might seize and transfer to each other, without regard to the natural inhabitants, whom they considered as beings of a subordinate race and character. Accordingly this transference of Louisiana excited no surprise in Europe.

Meanwhile, as the king's message to the House of Commons, already mentioned, evinced a determination on the part of the British government to prefer a new war rather than suffer Bonaparte to carry further his ambitious pro-

jects, the mind of that extraordinary person seems to have been wrought up to an extraordinary degree of irritation. In his palace he affected to use all the forms of the ancient French court. At the drawing-room, where he was waited upon by the whole ambassadors of Europe, and by a numerous assemblage of persons of high rank from all countries, he could scarcely observe the ordinary forms of civility to the British ambassador; and Lord Whitworth, in a dispatch dated the 14th of March, which was afterwards communicated to parliament, gave the following account of the behaviour of the first consul on one occasion at the court of the Thuilleries:—

“He accosted me evidently under very considerable agitation. He began by asking me if I had any news from England? I told him I had received a letter from Lord Hawkesbury two days ago. He immediately said, ‘And so you are determined to go to war.’ ‘No,’ I replied; ‘we are too sensible of the advantages of peace. We have had war for fifteen years already.’ As he seemed to wait for an answer, I observed only, ‘We have had too much of it.’ ‘But you wish to carry it on for fifteen years longer, and you force me to it.’ I told him that it was very far from his majesty’s intentions. He then proceeded to Count Marcof and the Chevalier Azara, who were standing together at a little distance from me, and said to them, ‘The English wish for war, but if they are the first to draw the sword, I shall be the last to sheath it. They have no regard to treaties, henceforth they should cover them with black crape.’ In a few minutes he came back to me, and resumed the conversation by something personally civil to me. He began again, ‘Why these armaments? Against what are these measures of precaution? I have not a single ship of the line in the ports of France; but if you wish to arm, I will arm also. If you wish to fight, I will fight also. You may perhaps destroy, but you will never intimidate France.’ ‘We wish neither the one nor the other. It is our desire to live in good understanding with her.’ ‘You must regard treaties then. Confusion to those who have no regard to treaties: (*malheur à ceux qui ne respectent pas les traités!*) they will be responsible for it to all Europe.’ He was too much agitated to make it advisable for me to prolong the conversation. I therefore made no answer; and he retired to his apartment repeating the last phrase. It is to be remarked, that all this passed loud enough to be heard by two hundred people who were present; and I am persuaded that there was not a single person who did not feel the impropriety of his conduct, and the total want of dignity as well as of decency on the occasion.” The negotiations in the mean time proceeded; and Bonaparte still insisted upon the literal fulfilment of the treaty of Amiens. He appears to have flattered himself that the British ministry would not venture to renew the war on account of Malta. Their pacific dispositions were well known; they had suffered him to make great encroachments upon the Continent without engaging in hostilities; they were understood to consist of men who were not the leaders of any party, but had only held a subordinate rank as supporters of Mr Pitt’s administration; and they had been loudly accused in Britain by the ex-ministers, and by many of the old opposition, of want of talents and want of spirit, on account of the apparent tameness with which they had recently acted. It seems likely, therefore, that Bonaparte presumed that they would ultimately give way to his demands. But the good temper and forbearance of administration had the effect of rousing the spirit of the British nation, and of inducing, in a large proportion of the people, a wish to engage in a war against a man whom they now detested as an odious usurper. Thus encouraged, administration rose in their demands; and on the 12th of May Lord Whit-

worth presented the ultimatum of the British government, which was in substance that the French government should engage to make no opposition to the cession of the island of Lampedosa to his majesty by the king of the Two Sicilies; that, in consequence of the present state of the island of Lampedosa, his majesty should remain in possession of the island of Malta until such arrangements should be made by him as might enable him to occupy Lampedosa as a naval station, after which period the island should be given up to the inhabitants, and acknowledged as an independent state; that the territories of the Batavian republic should be evacuated by the French forces within one month after the conclusion of a convention founded on the principles of this project; that the king of Etruria and the Italian and Ligurian republics should be acknowledged by his majesty; that Switzerland should be evacuated by the French forces; that a suitable territorial provision should be assigned to the king of Sardinia in Italy; and, in a secret article, that his majesty should not be required by the French government to evacuate the island of Malta until after the expiration of ten years. The proposed stipulations relative to the king of Etruria, the Italian and Ligurian republics, and the king of Sardinia, were merely inserted as make-weights; and accordingly, in an additional article, it was provided that they might be omitted, but that, if inserted at all, they must be inserted together.

This ultimatum having been rejected, war was announced on the 16th of May, by a message from the king to the two houses of parliament; and on the 21st of May a declaration, justifying this measure, appeared in the London Gazette. As the statements contained in this document exhibit a detail of the public acts alleged to have occasioned the renewal of the war, it may be proper to insert a few of its leading paragraphs.

“As soon as the treaty of Amiens was concluded, his majesty’s courts were open to the people of France for every purpose of legal redress. All sequestrations were taken off their property; all prohibitions on their trade, which had been imposed during the war, were removed; and they were placed on the same footing, with regard to commerce and intercourse, as the inhabitants of any other state in amity with his majesty with which there existed no treaty of commerce.

“To a system of conduct thus open, liberal, and friendly, the proceedings of the French government afforded the most striking contrast. The prohibitions which had been placed on the commerce of his majesty’s subjects during the war have been enforced with increased strictness and severity. Violence has been offered in several instances to their vessels and their property; and in no case has justice been afforded to those who may have been aggrieved in consequence of such acts; nor has any satisfactory answer been given to the repeated representations made by his majesty’s ministers or ambassadors at Paris. Under such circumstances, when his majesty’s subjects were not suffered to enjoy the common advantages of peace within the territories of the French republic and the countries dependent upon it, the French government had recourse to the extraordinary measure of sending over to this country a number of persons for the professed purpose of residing in the most considerable seaport towns of Great Britain and Ireland in the character of *commercial agents or consuls*. These persons could have no pretensions to be acknowledged in that character, as the right of being so acknowledged, as well as the privileges attached to such a situation, could only be derived from a commercial treaty, and as no treaty of that description was in existence between his majesty and the French republic.

Reign of
George III.

"There was consequently too much reason to suppose that the real object of their mission was by no means of a commercial nature; and this suspicion was confirmed, not only by the circumstance that some of them were military men, but by the actual discovery, that several of them were furnished with instructions to obtain the soundings of the harbours, and to procure military surveys of the places where it was intended they should reside. His majesty felt it to be his duty to prevent their departure to their respective places of destination, and represented to the French government the necessity of withdrawing them; and it cannot be denied, that the circumstances under which they were sent, and the instructions which were given to them, ought to be considered as decisive indications of the dispositions and intentions of the government by whom they were employed.

"If the French government had really appeared to be actuated by a due attention to such a system, if their dispositions had proved to be essentially pacific, allowance would have been made for the situation in which a new government must be placed, after so dreadful and extensive a convulsion as had been produced by the French revolution. But his majesty has unfortunately had too much reason to observe and to lament, that the system of violence, aggression, and aggrandisement, which characterised the proceedings of the different governments of France during the war, has been continued with as little disguise since its termination. They have continued to keep a French army in Holland, against the will and in defiance of the remonstrances of the Batavian government, and in repugnance to the letter of their solemn treaties. They have, in a period of peace, invaded the territory and violated the independence of the Swiss nation, in defiance of the treaty of Luneville, which had stipulated the independence of their territory, and the right of the inhabitants to choose their own form of government. They have annexed to the dominions of France, Piedmont, Parma, and Placentia, and the island of Elba, without allotting any provision to the king of Sardinia, whom they have despoiled of the most valuable part of his territory, though they were bound by a solemn engagement to the emperor of Russia to attend to his interests, and to provide for his establishment. It may indeed with truth be asserted, that the period which has elapsed since the conclusion of the definitive treaty has been marked with one continued series of aggression, violence, and insult, on the part of the French government."

With regard to Malta, the declaration proceeded to state, "that when the French government demanded its evacuation, several articles of the treaty of Amiens respecting it remained unexecuted. The tenth article had stipulated that the independence of the island should be placed under the guarantee and protection of Great Britain, France, Austria, Russia, Spain, and Prussia. The emperor of Germany had acceded to the guarantee, but only on condition of a like accession on the part of the other powers specified in the article. The emperor of Russia had refused his accession, except on the condition that the Maltese langue should be abrogated; and the King of Prussia had given no answer whatever to the application which had been made to him to accede to the arrangement. That the fundamental principle upon which depended the execution of the other parts of the article had been defeated by the changes which had taken place in the constitution of the order since the conclusion of the treaty of peace. It was to the order of St John of Jerusalem that his majesty was by the first stipulation of the tenth article bound to restore the island of Malta. The order is defined to consist of those langues which were in existence at the time of the conclusion of the treaty.

The three French langues having been abolished, and a Maltese langue added to the institution, the order consisted therefore at that time of the following langues, viz. Arragon, Castile, Germany, Bavaria, and Russia. Since the conclusion of the definitive treaty, the langues of Arragon and Castile have been separated from the order by Spain, and part of the Italian langue had been abolished by the annexation of Piedmont and Parma to France. There is strong reason to believe that it has been in contemplation to sequester the property of the Bavarian langue, and the intention has been avowed of keeping the Russian langue within the dominions of the emperor."

The French were also accused of having instigated or effected the whole of these changes, and of thus having rendered it impossible to fulfil that part of the treaty; and it was further remarked, that from a report published by an accredited agent of the French government, Colonel Sebastiani, it appeared that France entertained views hostile to the Turkish empire, the integrity of which had been expressly stipulated, and that this rendered the retention of Malta more necessary. The behaviour of the first consul to Lord Whitworth at his audience was also noticed, together with some other offensive occurrences; and it was observed that "his majesty might add to this list of indignities, the requisition which the French government have repeatedly urged, that the laws and constitution of this country should be changed, relative to the liberty of the press. His majesty might likewise add the calls which the French government have on several occasions made to violate the laws of hospitality, with respect to persons who had found an asylum within his dominions, and against whose conduct no charge whatever has at any time been substantiated. It is impossible to reflect on these different proceedings, and the course which the French government have thought proper to adopt respecting them, without the thorough conviction that they are not the effect of accident, but that they form a part of a system which has been adopted for the purpose of degrading, vilifying, and insulting his majesty and his government."

Administration were now placed in a very singular situation. Mr Fox, who opposed the war, proposed that an attempt should be made to prevail with the emperor of Russia to mediate a peace, upon the supposition that, if his mediation was rejected by France, we might be able to secure an alliance with him; and to this proposal administration acceded; but although Mr Fox opposed the war, almost the whole of the other members of the old opposition, including Mr Sheridan and Mr Tierney, strongly approved of it, while Mr Pitt and the rest of the ex-ministry joined in the opinion. As Bonaparte had threatened to attempt an invasion, the parties out of power laid hold of this circumstance to excite alarm, and industriously represented the actual ministers as men of moderate capacity, unfit to be intrusted with the defence of the empire in a perilous crisis. Mr Pitt and his colleagues, in their speeches in parliament, represented the nation as in danger of being instantly invaded by an innumerable host of experienced troops, who could not be expected to delay more than a few days the attempt to land upon our shores; the members of the old opposition held precisely the same language; and the views of both probably were in some degree to terrify the country to call for their services, as men of greater energy than the present rulers. The militia, both ordinary and extraordinary, were called out; a new body of troops was ordered to be raised by ballot, under the appellation of an army of reserve; and corps of volunteers were formed throughout the whole island. An act of parliament was also passed for calling out, in case of actual invasion, the whole male population of the kingdom,

of III. in classes according to their age or their situation in life; and to meet the expense of these different armaments, and of the augmentation of the navy, the income tax was restored with certain modifications.

The administration thus found their adversaries, unlike any former opposition, striving with emulation to do their work for them, and to strengthen government by new armaments of every kind. The consequence was, that during the ensuing autumn, ministers seemed to become perplexed by the multiplicity of business in their hands, and to entertain doubts about the propriety of some of the measures in which they had embarked. The plan of raising such numerous bodies of troops by ballot, while substitution was at the same time permitted to those upon whom the ballot fell, became a most unequal mode of raising an army for the defence of the state, as it fell upon persons not according to their means, but according to their age. But it was attended with one good effect, that as the bodies of volunteers raised by permission of government enjoyed an exemption from certain ballots, this operated, along with the spirit of the country, as a sufficient premium to induce great multitudes of persons to enrol themselves for the purpose of acquiring the military exercise. Ministers at times hesitated to receive the numerous bodies of volunteers who offered themselves; but as they afterwards departed from this reluctance, nearly four hundred thousand men were trained to the use of arms, exclusive of the regular army, the militia, and the army of reserve.

In the meanwhile the ports of France were closely blockaded, and the foreign possessions of the French seized; while the only step of retaliation in their power to exert consisted in seizing the electorate of Hanover, which they plundered unmercifully. Bonaparte offered to give up Hanover as the price of Malta; but his offer was refused.

The most inconvenient circumstance to Great Britain, arising out of those political transactions, consisted in the great embarrassment occasioned to persons engaged in commerce, which proved the cause of numerous bankruptcies. Towards the close of the former war trade had found out for itself regular channels; and, in particular, the port of Hamburg had become the great store-house of British merchandise, from which, as a neutral state, it was distributed amongst the countries engaged in the war. The conclusion of a treaty of peace produced the daily expectation of a renewal of the intercourse with France, and therefore put a stop to the circuitous trade by Hamburg. But as no place was substituted instead of the latter, a suspension of operations in some manufactures occurred; and when these difficulties were coming to a close, the renewal of the war produced a new uncertainty as to the channels in which the European trade would hereafter flow. The difficulty was increased in consequence of the invasion of Hanover by the French, and their excluding the British from the navigation of the Elbe, while the latter in their turn blockaded the river with ships of war, and thus excluded all the world.

Parliament assembled on the 22d of November. In the speech from the throne his majesty said,—“ Since I last met you in parliament, it has been my chief object to carry into effect those measures which your wisdom had adopted for the defence of the united kingdom, and for the vigorous prosecution of the war. In these preparations I have been seconded by the voluntary exertions of all ranks of my people, in a manner that has, if possible, strengthened their claims to my confidence and affection. They have proved that the menaces of the enemy have only served to rouse their native and hereditary spirit; and that all other considerations are lost in a general disposition to

make those efforts and sacrifices which the honour and the safety of the kingdom demand at this important and critical conjuncture. Though my attention has principally been directed to the great object of internal security, no opportunity has been lost of making an impression on the foreign possessions of the enemy. The islands of St Lucie, Tobago, St Pierre, and Miquelon, and the settlements of Demerara and Essequibo, have surrendered to the British arms. In the conduct of the operations by which these valuable acquisitions have been made, the utmost promptitude and zeal have been displayed by the officers employed in those services, and by my forces acting under their command by sea and land. In Ireland, the leaders and several inferior agents in the late traitorous conspiracy have been brought to justice, and the public tranquillity has experienced no further interruption. I indulge the hope that such of my deluded subjects as have swerved from their allegiance are now convinced of their error; and that having compared the advantages they derived from the protection of a free constitution, with the condition of those countries which are under the dominion of the French government, they will cordially and zealously concur in resisting any attempt that may be made against the security and independence of my united kingdom.”

The usual address to the throne was unanimously carried, though Mr Fox complained that nothing had been said respecting the state of our negotiations with Russia. The debates in parliament during the present session were by no means interesting. In the course of the winter, the French government continued to repeat with much confidence their threats of invasion, and the people of Great Britain remained in daily expectation that a landing would be attempted. But nothing of any importance took place. Bonaparte travelled repeatedly from Paris to the sea-coast, and back again to Paris. It was announced that a body of guides had been formed to conduct the invading army after it had landed in England; and the generals and admirals by whom the expedition was to be conducted were said to have gone to their respective posts. Nothing however occurred, excepting the sailing from one French port to another, under the cover of land-batteries, of small parties of flat-bottomed boats, which, at times, evaded the vigilance of the British cruisers, though they were frequently captured, driven ashore, or sunk.

The parliamentary proceedings in the summer session of 1803 were remarkable, as indicating the existence of three or four distinct parties, amidst an almost general concurrence in support of the war. These parties were, first, that of the ministry and their usual followers; secondly, that of the Grenvilles and Mr Windham, who had all along blamed the peace of Amiens, and predicted that it would prove a mere truce; thirdly, that of Mr Pitt and Lord Melville, who, after approving that peace, had, on the continued aggressions of Bonaparte, become ardent supporters of war; and, fourthly, that of Mr Fox, with a part of the old opposition, who were of opinion that the war might have been avoided. But the last were so far from being numerous, that a motion, made on the 23d of May, to express the concurrence of parliament in the war, was opposed by a minority of only ten in the Peers and sixty-seven in the Commons. A subsequent measure, in the same spirit, namely, an act for arming a large part of the population, was carried in July by a great majority; and similar ardour was evinced in submitting anew to war taxes, particularly to a five per cent. income-tax. After the adoption of several other measures of a like description, and a most interesting session of nine months, parliament was prorogued on 12th August.

The next session opened on the 22d of November, and discovered the same alacrity for the prosecution of the war, mixed, however, with a growing opposition to ministers. Mr Pitt had, from the beginning of the war, foreborne to commend them, and, since the failure of a negotiation to bring him into office, had assumed a language occasionally hostile. He continued to support their propositions for the public defence, and frequently improved them in their progress through parliament; but he disclaimed all personal connection with ministers, and at last treated them as incapable of originating any measure of vigour or utility. This disposition could scarcely fail to be turned to account by those busy intermediaries, who find means to combine the efforts even of opposite parties for the purpose of getting into power. On the 15th of March Mr Pitt, aware of the side on which the public was most alive to alarm, brought forward a motion for an inquiry into the management of the navy. On this occasion, severe as was his language in regard to Lord St Vincent, then at the head of the admiralty, he received the support of the opposition, and had on his side a hundred and thirty votes against two hundred and one. From this time forward the strength of ministers was visibly shaken. On the 23d of April Mr Fox brought forward an eagerly-expected motion on the defence of the country, in which Mr Pitt joined, with great animosity against the ministers. On a division, government had a majority of fifty-two, which, in a second debate, on the 25th of April, was reduced to thirty-seven. Soon after this, ministers resigned, and Mr Pitt, called to the royal presence, was desired to form an administration, exclusive, however, of Mr Fox. This peremptory order, and Mr Pitt's too ready acquiescence in it, proved the source of the greatest difficulties.

The Grenvilles had recently so connected themselves with Mr Fox and his friends, that a separation would have been altogether dishonourable; and their united strength, joined to the occasional support of Mr Addington's adherents, was the cause, during the remainder of the session, of very strong divisions against the new ministers, particularly in the Commons. Their chief measure, entitled the Additional Force Bill, was carried by only two hundred and sixty-five to two hundred and twenty-three. The session soon afterwards closed, but not without passing a corn bill, evidently intended to dispose the landed interest to submit to the new taxes, and prohibiting the importation of foreign wheat whenever our own should be at or below sixty-three shillings the quarter.

On the continent of Europe, the only great operation was the invasion, or rather occupation, of Hanover, to which allusion has already been made. War having been declared by us on the 18th May, the French troops advanced from Holland, and entered the electoral capital by the 5th of June. To attempt resistance would have been folly; but in a season when soldiers were so much wanted in England, and so great an expense was incurred in training them, it was matter of regret that the Hanoverian troops, in number about fifteen thousand, should not have been marched down to the coast, and embarked in a body, instead of being disbanded and obliged to pledge themselves not to serve against France until exchanged.

On the side of France the aspect of war was displayed in a great encampment at Boulogne, and in the dispatch, from all the ports along the coast, of flotillas of boats to join the armament preparing in that central rendezvous. These petty convoys had instructions to tempt our cruisers to attack them, and to draw them, at fit occasions, under the fire of land-batteries; and they were sometimes successful in doing so. The main object of Bonaparte was to excite alarm; a course which, however politic toward some countries, was certainly ill judged in regard to one where the executive power, in its inability to coerce, often seeks support in the apprehensions of the public. The general impression of dread facilitated the measures of defence, and led to the volunteer system, which was carried to an unparalleled extent. Never did a country exhibit so many of the middle and higher classes under arms as England and Scotland in 1803; and never did individuals in these stations make more personal sacrifices for the object of national defence. The result was effectual to as great a degree as the situation of the individuals permitted. The volunteers made as near an approach to regularity of discipline as was practicable in the case of men full of ardour, and submitting for a season to the restraint of military service, but necessarily devoid of experience in the field. The error lay in carrying volunteering too far; for the system ought never to have been allowed to extend to a length that absorbed no inconsiderable part of the time and money of men whose lives were too valuable to be indiscriminately exposed, and whose proper aid to the public cause was the tribute of their industry. The volunteer system was of real use only in as far as it promoted cordiality in the common cause, and, by assuring the maintenance of tranquillity at home, enabled government to dispose of the regulars in the field. The plan of collecting flotillas of boats, from east to west, in the central depôt of Boulogne, was continued by Bonaparte, during two years, from the middle of 1803 to that of 1805. A great parade was made of the number of troops ready to embark, and of the determination to encounter all hazards; but there was no efficient support by ships of war, until the spring of 1805, when the sailing of squadrons for the West Indies took place, first from Rochefort, and afterwards from Cadiz. These, it was cal-

Reign of
George III.

George III.

culated, might excite alarm for our colonies, and induce government to send thither a portion of the men of war hitherto reserved for home defence; after which the hazardous attempt of a descent might have entered seriously into the calculations of the French ruler. That it did so at this time was positively affirmed by him in conversations held with English gentlemen in the island of Elba, and afterwards in that of St Helena; but these conversations were marked by sundry misrepresentations; for he attributed the non-execution of the attempt entirely to the threatened coalition on the Continent, and would not acknowledge that it was impracticable;—a matter of nautical calculation, when our government kept our channel fleet at home, instead of sending it, as he had anticipated, to the West Indies.

Such was the aspect of the war during two years, in which our naval superiority led to an easy conquest of several of the Dutch and French West India colonies. St Lucie surrendered on the 22d of June 1803; Tobago, on the 1st of July; Demerara and Berbice, on the 23d of September; and Cape Town, the last spot in the French half of St Domingo, occupied by French troops, capitulated to the Blacks on the 30th of November. Next year was taken the small island of Gorce, on the coast of Africa, and soon after the important Dutch colony of Surinam. On the other hand, we were not successful in our attempts on the French flotillas on their own shores. One of these was directed against a convoy on the coast between Flushing and Ostend; another, on a larger scale, and very different plan, was pointed at the Boulogne armament, which it was proposed to blow up by *catamarans*; an attempt no less unsuited to open and generous warfare than the torpedoes of the Americans. Fortune was more favourable to us in encounters with the enemy in the open ocean, where, in the early part of 1804, a striking proof of the effects of intrepidity was given in the case of a fleet of merchantmen from China, which beat off, or at least deterred from action, a French squadron under Admiral Linois, consisting of a ship of eighty guns and three frigates.

The war hitherto had been with France and Holland only; but a new power was now to be added to the list of our antagonists. Spain had been allowed by Bonaparte to avoid participating in the contest, on condition of paying a large annual contribution; a condition so contrary to real neutrality, that for some time past our government had kept a vigilant eye on the expected arrival of her treasure ships from America. A small squadron of four frigates, sent out to intercept these valuable supplies, met, on the 5th of October 1804, a Spanish squadron of a similar number proceeding towards Cadiz; and the Spanish commodore refusing to surrender, an engagement ensued, attended with the capture of three of the Spanish frigates, and the explosion of the fourth, accompanied with the loss of many lives. This decisive act, approved at home by the advocates of vigorous measures, was productive of the worst impressions in regard to our national honour both in Spain and her colonies, and led soon afterwards to a declaration of war by that power.

Bonaparte was now provided with additional means of threatening our distant possessions. A squadron of five sail of the line escaping from Rochefort, landed a body of nearly four thousand men on the island of Dominica, and burned the chief town; the island of St Kitt's escaped with paying a contribution and the loss of some merchantmen. But this was only a prelude to the arrival of a much more formidable fleet, which, to the number of eighteen sail of the line, French and Spanish, reached the West Indies in the end of May, and spread alarm throughout the islands; an alarm not dispelled till the arrival of a force inferior by nearly one third, but commanded by Lord

Reign of
George III.

Nelson. The hostile fleet soon after set out on its homeward voyage. Intelligence to that effect was opportunely received by Lord Barham, then at the head of the admiralty; and a fleet, detached to cruise on their supposed track, had the good fortune to fall in with them on 22d July. An action took place; two sail of the line, Spanish ships, were captured; night terminated the conflict; and though it might have been renewed on the succeeding days, an unfortunate indecision on the part of our admiral, Sir Robert Calder, allowed the enemy to escape. They soon afterwards repaired to Ferrol, whence they sailed with augmented force, and reached Cadiz.

To watch them there, or to engage them on their coming out, was now an object of the highest moment; and it was to Lord Nelson that this important trust was committed. Joining our fleet off Cadiz on the 20th September, he avoided keeping in sight, and even dispensed with the aid of six sail of the line, which he sent to a distance along the coast; judging that the enemy, when apprized of their absence, would be induced to come out. Accordingly, the combined fleet left Cadiz on the 19th of October, to the number of thirty-three sail of the line, eighteen French and fifteen Spanish, commanded by Admiral Villeneuve, and early on the 21st came in sight of the British fleet, consisting of twenty-seven sail of the line, off Cape Trafalgar, about half way between Cadiz and Gibraltar. The enemy, convinced that their former defeats at sea had been owing to the want of concentration and mutual support, now formed a double line, every alternate ship being about a cable's length to windward of her second ahead and astern, so that any of our ships, attempting to penetrate, would be exposed to the fire of two or of three antagonists. Nelson, while yet distant, perceived their arrangement, and understood its object. It was new, but he was satisfied that no concentration in the open sea could prevent our vessels from coming to close action with their opponents, in which case the result could not long be doubtful. He consequently made no alteration in his previous plan, which was to make the order of sailing the order of battle, the fleet being in two lines, with an advanced squadron of eight of the fastest sailing two-deckers; but directed the fleet to advance to the attack in two divisions, one of which, under Admiral Collingwood, intersected that part of the enemy's line which gave it nearly an equal number of ships to encounter; whilst Nelson, with the other division, acted on a similar plan. Such was the only general manœuvre in this great action. By our superior seamanship, and our ships keeping near each other, we had in some cases a local superiority; but the general character of the fight was a conflict of ship to ship; and its decision in our favour was owing to that skill in working the guns, to that dexterity in an occasional change of position, and that confidence of success which characterizes a naval force in a high state of discipline. Our loss, amounting to sixteen hundred men, was in part caused by the riflemen in the enemy's rigging; an ungenerous mode of warfare, which may deprive an opposing force of officers, but can have little effect on the general issue of a conflict. The fighting began at noon, became general in less than half an hour, and lasted from two to three hours; in the case of a few ships it continued longer, but all firing was over by half-past four o'clock. The victory was complete, but purchased by the death of Nelson, who was mortally wounded by a musket ball fired from the mizen-top of the Redoubtable, by one of the enemy's riflemen, and expired just as the action closed. Nineteen sail of the line struck; but unfortunately gales of wind, after the action, wrecked part of our prizes, and necessitated the destruction of others. Four sail, however, were preserved; and four more, which had escaped, under Rear-admiral Dumanoir, were

Reign of
George III.

met on their northward course, on the 2d of November, and captured off Cape Ortegal, by a squadron under Sir Richard Strachan.

But upon the continent of Europe the course of public events was very different. The year had been ushered in by a letter of Bonaparte to our sovereign, containing pacific expressions couched in general terms. An answer was given, not by the king, but, according to diplomatic usage, by our minister for foreign affairs, to the French minister in the same station, expressing a similar wish for peace, but adding, that it was incumbent on us to consult our allies, particularly the emperor of Russia. The French ridiculed the assertion of our being on confidential terms with that court; but Russia had in fact begun to listen to the proposal of forming a coalition against France on an extensive scale. The basis of this compact was a treaty signed at St Petersburg in April. Russia, Austria, Sweden, Naples, all acceded to it, and hopes were entertained of the co-operation of Prussia. Bonaparte, apprized of this, affected to be absorbed in arrangements for immediately invading England, but secretly prepared to march his troops from Boulogne to the Rhine. After throwing on the Austrians the odium of aggression, by allowing them to attack Bavaria before he acted, he proceeded to execute a plan singularly adapted to the overweening confidence of his opponent, General Mack, who by this time had traversed Bavaria and advanced to Ulm. By executing forced marches, and violating part of the neutral territory of Prussia, Bonaparte reached first the flank, and soon afterwards the rear, of the enemy, who clung with blind pertinacity to the position of Ulm. The result to the Austrians was a series of checks in the field, and eventually the surrender, by capitulation, of more than thirty thousand men. The road to Vienna was thus opened to Bonaparte. He marched thither, crossed the Danube, proceeded northward, and at Austerlitz, on the 2d of December, displayed his military combinations in all their lustre, gaining over the Austrians and Russians, with forces not superior, a victory which compelled Austria to immediate peace; and thus by one blow broke up the coalition.

Before the opening of the session of 1805, an overture, suggested, it is said, by the sovereign personally, was made to Mr Addington; and, after some discussion, it was accepted, Mr Addington receiving the presidency of the council for himself, and corresponding situations for his friends. With this support ministers met parliament; and in one of the first great questions the approval of the war with Spain obtained the concurrence of three hundred and thirteen votes against a hundred and six. In subsequent divisions, the majorities, though less decisive, were considerable, until the 6th of April, when Mr Whitbread brought forward a most interesting discussion on the tenth report of the commissioners of naval inquiry, which implicated Lord Melville. This question, debated in a full house, produced a division of two hundred and sixteen against two hundred and sixteen, when, after a most anxious pause, the resolutions moved by Mr Whitbread were carried by the casting vote of the speaker. This led immediately to the resignation by Lord Melville of his office of first lord of the admiralty, and was followed by the erasure of his name from the list of privy counsellors. Some time after, his lordship was, at his own desire, heard before the House of Commons; and whilst he acknowledged that temporary irregularities in the appropriation of the public money had taken place when he was treasurer of the navy, he disclaimed, on his honour, the alleged participation in the profits of Mr Trotter, who had acted as his paymaster. But the expectations of the public were raised, and a prosecution, in some shape or other, was indispensable. A motion for an impeachment before the Lords, made by Mr

Whitbread, was lost by two hundred and seventy-two to a hundred and ninety-five; but the Addington party joining opposition in a motion for a criminal prosecution, the latter was carried by two hundred and thirty-eight against two hundred and twenty-nine. Lord Melville and his friends, dreading this more than an impeachment, found means, by a sudden division of the house, to rescind the vote to that effect, and to decide on an impeachment before the Lords. And parliament was prorogued after giving ministers a vote of credit to the extent of three millions, to be applied, if necessary, in subsidies to continental powers.

The proceedings against Lord Melville made a deep impression on Mr Pitt, and deprived him of his only efficient coadjutor, at a time when, from the magnitude of his public cares, he was more than ever in want of support. The consequent fatigue and anxiety made severe inroads on a constitution naturally not strong. His indisposition became apparent in the early part of winter, and, on the meeting of parliament, it was understood to have reached a dangerous height. His death took place on the 23d January 1806. A motion, brought forward a few days after, to grant a public funeral, and to erect a monument to the late excellent minister, excited much discussion. Mr Fox paid a high tribute to the financial merits of his great rival, which, in fact, were extremely questionable; but he could not join in ascribing the epithet of "excellent" to measures which he had so often opposed. Mr Windham also opposed the vote; and the Grenvilles chose to be absent. Still the motion was carried by two hundred and fifty-eight against a hundred and sixty-nine. To a subsequent proposition for a grant of £40,000 for the payment of Mr Pitt's debts, no opposition was made.

The public attention was now fixed on the approaching change of ministry. The king, in concurrence, it is said, with the death-bed recommendation of Mr Pitt, sent for Lord Grenville, desired him to form a ministry, and made no opposition to the admission of Mr Fox into the cabinet; but he is said to have expressed a desire that the Duke of York should retain the office of commander-in-chief. The new administration was formed on a broad basis, comprising the friends of Lord Grenville, those of Mr Fox, and those of Lord Sidmouth. But hardly had they entered upon office when circumstances occurred which placed in a striking light the different conduct of men when in and out of power. Lord Grenville thought fit to hold the incompatible offices of first lord and auditor of the treasury, and the chief justice was admitted to a seat in the cabinet, whilst Mr Fox consented to come forward as the vindicator of both.

The defence of the country against the great military power of France being still the most anxious consideration, the first measure of a comprehensive nature was brought forward by Mr Windham, whose station in the new ministry was the war department. It proposed the repeal of Mr Pitt's additional force bill, and a plan for improving the regular army, by substituting a limited for an unlimited term of service, and by granting a small increase of pay after the expiration of the prescribed term. These propositions, brought forward in the end of April and beginning of May, were warmly opposed: they passed, however, by a great majority in both houses, and would, doubtless, have conduced materially to the improvement of our army had they received a fair trial; but the succeeding ministries sought, during the whole war, to procure enlistments for life. In France, since 1817, the rule is, to be scrupulous about the character of recruits, to give little or no bounty, but to limit the period of service, and to increase the pay after the expiration of the specified term. The same principle, differently modified, prevails both in Prussia and in Austria.

Reign of George III. Of the budget, the most remarkable feature was an increase of the property-tax from six and a half to ten per cent., the odium of which ministers sought to lessen by the appointment of a board of auditors to examine the long-standing arrears in public accounts. In regard to trade, the principles of this ministry, though little understood, and even disliked by the great majority of merchants, were entitled to much attention. They attempted to introduce into our practical policy some of the doctrines of Dr Smith, doctrines which Mr Pitt had studied in his early years, but to which circumstances had not allowed him to give an extensive application. The letter of our navigation laws forbade all intercourse between our colonies and other countries; but our West India colonies were, in time of war, so dependent on the United States for provisions, that it had been customary with the island governors to take on themselves the responsibility of infringing these acts, and to obtain regularly a bill of indemnity from parliament. Mr Fox now brought in a bill termed the American Intercourse Act, the purport of which was, to authorize the governors of our colonies to do, during the remainder of the war, that which they had hitherto done from year to year, and to dispense with any application for indemnity. This bill, moderate and politic as it in fact was, met with keen opposition in parliament, and with still keener out of doors from the shipping and commercial interests. It passed into a law; but it was denounced as a glaring infraction of our navigation code, and contributed, more than any other measure, to shake the popularity of ministers.

The trial of Lord Melville before the House of Peers began on the 29th of April 1806. The charges against him, little understood by the public at large, related to an infraction of his official duty, not as a member of the cabinet, but in his early and inferior station of treasurer of the navy. These charges may be comprised under the following heads: That he had allowed Mr Trotter, his paymaster, to take the temporary use and profit of sums of money lodged in the bank for the naval expenditure; that he had himself participated in such profits; and, finally, that he had applied certain sums of the public money to his private use. All participation in the speculations or profit of his paymaster his lordship positively denied, but he acknowledged a temporary appropriation of the sum of £10,000 in a way which private honour and public duty forbade him to reveal. The trial closed on the 12th of June. The articles of impeachment had been extended to the number of ten, and on all of them there was a majority of peers for his acquittal; but whilst in regard to the charge of conniving at stock speculations by Trotter, or converting the public money to his private use, the majorities were triumphant, the case was otherwise in regard to his lordship's permitting an unauthorized appropriation of the public money by Trotter, and receiving from him temporary loans, the records of which were afterwards destroyed.

Though the present parliament had completed only four sessions, ministers determined on a dissolution, doubtless from a wish to have the benefit of the government influence in the new elections. They knew their weakness at court, and flattered themselves that a decided ascendancy in parliament would enable them to press, with greater confidence, measures for which they could not boast the cordial concurrence of their royal master. For the time of the new election they chose the moment of national excitement caused by the recal of our ambassador from the French capital. The first debate in the new House of Commons related to the abortive negotiation for peace; and although the publication of the official papers excited some surprise, and showed that Bonaparte had at one

time carried his offers of concession considerably farther than the public had supposed, there prevailed so general a distrust towards him, that Mr Whitbread stood almost alone in the opinion that the negotiation ought to have been continued. After some renewed discussions on Mr Windham's military measures, Lord Henry Petty, then chancellor of the exchequer, brought forward a plan of finance, which, assuming the expense of the current year as equal to that of subsequent years of war, professed to provide, without new taxes, for a contest of fourteen years or more. This plan contained an anticipated calculation of the loans necessary for several years to come, and supposed that a sum equal to ten per cent. on each loan should be appropriated from the war taxes, of which five per cent. should serve to pay the interest of the loan, and the other five per cent. form a sinking fund, which, by the operation of compound interest, would redeem the capital in fourteen years; leaving the whole ten per cent. again applicable to the same purpose should the war continue. That this plan possessed, no more than those of Pitt or Vansittart, the merit of increasing the productive power of our revenue, has been already shown by Dr Hamilton in his well-known *Treatise on the National Debt*. Its merit, had it been tried, would have been found to consist, as that of such plans generally does, in a support, perhaps a temporary increase, of public credit. It may even be questioned whether the same ministry, had they continued in office, would have restricted themselves to a limited expenditure in 1808, when the Spanish struggle called forth such a burst of national enthusiasm. There cannot, however, be a doubt that they would have avoided the orders in council, which, by depriving us of the unseen but powerful aid of neutral traffic, gave the first great blow to our bank paper, and consequently to our public funds.

The bill for the abolition of the slave-trade was now brought forward with all the weight of government support, and carried by triumphant majorities; in the Lords by a hundred to thirty-six, in the Commons by two hundred and eighty-three to sixteen. This prompt termination of a struggle of twenty years showed how easily the measure might have been carried had not Mr Pitt declined to give it ministerial support; a course suggested to him probably by a dread of offending the West India planters, but founded in a great measure on misapprehension, since the most respectable part of that body, the proprietors of long-settled estates, were far from being adverse to the abolition, calculated as it was to prevent that superabundance of produce which to them is the most serious of evils. This proved the last important bill of the Grenville ministry, whose removal from office took place very unexpectedly, in consequence of a difference with the sovereign about the Irish Catholics.

The bill which produced this sudden change was introduced by Lord Howick on the 5th of March, and entitled, "A bill to enable his majesty to avail himself of the services of all his liege subjects in his naval and military forces in the manner therein mentioned;" that is, by their taking an oath contained in the bill, after which they should be left to the free exercise of their religion. Here, as in the case of the American intercourse with the West Indies, the intention was less to introduce a new practice, than to permit by law what was already permitted by connivance. The draught of the bill had been previously submitted to the king, and returned by him without objection; but the royal attention was more closely drawn to it on its introduction into parliament, and on a vehement opposition from Mr Perceval, who described it as part of a system of dangerous innovation, and as a precursor of the abolition of all religious tests. The king now intimated his disapprobation of the bill to ministers, who endeavoured to modify

Reign of
George III.

it, but still without succeeding in rendering it acceptable to their sovereign. They then felt the necessity of withdrawing the bill, but inserted in the cabinet minutes a declaration, reserving to themselves two points: the liberty of delivering their opinion in parliament in favour of the proposed measure, and of bringing it forward at a future period. This minute was unfortunately couched in terms too positive, if not disrespectful to the king, who, always tenacious on the Catholic question, and never personally cordial with Lords Grenville and Howick, insisted that they should pledge themselves in writing never to press him again on the subject. Ministers declining to comply, the king consulted with Lord Eldon about forming a new ministry, and, receiving a ready assurance of the practicability of such a measure, refused to listen to a modified acquiescence with his late order, offered rather tardily by Lord Grenville. Ministers gave up the seals of office on 25th March; and next day the change and the causes which led to it were fully discussed in parliament. A short adjournment now took place, after which there occurred some remarkable trials of strength between the two parties. An independent member, Mr Brand, with reference to the conditions on which the ministry had come into office, made a motion, that it was contrary to the duty of members of the cabinet to restrain themselves by a pledge from advising the king on any subject. This motion produced a very long debate, but was lost by two hundred and fifty-eight against two hundred and twenty-six; while a corresponding motion in the Lords was lost by a hundred and seventy-one to ninety. A subsequent proposition, to express the regret of the house at the removal from office of so firm and stable an administration, was lost by two hundred and forty-four against a hundred and ninety-eight; and it became apparent, that in parliament, as at court, the fall of the Grenville ministry was decided.

It remains to make a few observations on their conduct when in office; and here an impartial inquirer will not be long in discovering that both their merits and demerits have been greatly exaggerated. Their war measures proved unimportant, particularly in the point which, in the then ardent state of the public mind, superseded all others—the annoyance of France; and the result was, an unconsciousness in the greater part of the people of what was really valuable in their views and conduct. Yet Mr Fox brought to the department of foreign affairs an intimate knowledge of continental politics, and an exemption from national prejudices, far, however, from being accompanied, as the vulgar supposed, by an indifference to our national interests. Lord Grenville, if naturally less conciliating, and less fitted for grand views, possessed a practical knowledge of business, and had become aware in retirement of the various errors which had arisen from a too early introduction into office. They had a liberal feeling towards Ireland and the United States; and though by no means lukewarm in their resistance to Bonaparte, they all held the impracticability of making any impression on his power by force of arms, until the occurrence of some combination of circumstances which should justify a grand and united effort. In what manner they would have acted had they been in power when the general insurrection in Spain burst forth, the public have no means of judging; so different is the language, and even the feeling, of politicians when in and out of office. Several of their measures, such as the introduction of the lord chief justice to a seat in the cabinet, and the assent to the appointment of such a commander as Whitelocke, were singularly ill-judged. To place Lord Grey, and after him Mr T. Grenville, at the head of the admiralty, was to declare to the public that professional knowledge was unnecessary in that high station, as if its

effects had not been most beneficially displayed in the administration, short as it was, of Lord Barham. Finally, their intemperate declaration in the cabinet minute of the 12th of March evinced a strange miscalculation of their strength, when put in opposition to the personal will of the sovereign and the existing prejudices of the public. The result was, that their fall caused no regret to the majority of the nation, and that the errors of their successors excited no wish for their recall.

Of the new ministry, the efficient members were, Mr Perceval, chancellor of the exchequer; Mr Canning, minister for foreign affairs; Lord Castlereagh for the war, and Lord Liverpool for the home department. One of their first measures was a prorogation of the parliament, followed by a dissolution, which gave them, in the elections, the advantage so lately enjoyed by their predecessors, with the further advantage of an alarm, strangely excited in the public mind, on the ground of popery. The new parliament met on the 22d of June, and, after passing the bills requisite for the army, navy, and other current business, was prorogued on the 14th of August.

The alternation of fortune by sea and land was so great, that 1806 had hardly commenced when fresh successes were obtained over the French navy. A division of the Brest squadron, after landing troops in the Spanish part of St Domingo, was overtaken by a superior force, and three sail of the line captured and two burned. Admiral Linois, returning from India, was captured in the Maren-go of eighty guns; and, at a subsequent date, of a squadron of frigates detached from Rochefort for the West Indies, four fell into our hands.

It was under these circumstances that a negociation for peace was for some months carried on at Paris. It began in consequence of an overture from Talleyrand, eagerly embraced by Mr Fox; and Lord Yarmouth, who happened to be under detention in France, was made the first medium of communication and conference. In its more advanced stage, the negociation was intrusted to Lord Lauderdale; and at one period, namely, in September, the conciliatory tone of the French inspired a hope of peace; a hope soon disappointed, when it was found that the offers of Bonaparte were followed by the demand of Sicily, and that, whilst professing an ardent wish for peace, he was extending his usurpations in Germany, and secretly preparing to subvert the power of Prussia.

The humiliation of Austria left Bonaparte at liberty to direct his manœuvres, both diplomatic and military, against her northern rival. Affecting great indignation at the friendly disposition shown by Prussia, in the preceding autumn, towards the coalition, he demanded the cession of a portion of her territory in the south-west, and, in return, transferred to her Hanover, in the hope of kindling the flame of discord between her and England. The Prussians accordingly entered Hanover; the local government making no resistance, and our cabinet taking no retaliatory measure, except the detention of vessels bearing the Prussian flag; a measure adopted, not in the spirit of hostility, but to satisfy popular clamour in England. The discussions between France and Prussia continued during the summer of 1806, and, from the blind confidence of one party, and the artifice of the other, assumed at last a serious aspect. War was declared; the battle of Jena deprived Prussia of her army, her capital, and her fortresses; and her court was fugitive in the north of Poland, ere there had been time to send, or even to concert the sending of succours from England. The Grenville ministry, less eager than their predecessors to embark in continental war, confined themselves to sending a general officer, Lord Hutchinson, to the Russian head-quarters, and to the grant of a limited subsidy. For some time the difficulties of the country, and the firm

sign of
age III. resistance of the Russians, particularly at Eylau, encouraged the hope of arresting the progress of Bonaparte; but this hope was disappointed by the battle of Friedland, and still more by the approximation of the court of Russia to that of France.

The treaty of Tilsit excited alarm, less from its specific provisions, than from the probable consequences of the co-operation of the contracting powers. Among these, some persons reckoned, or pretended to reckon, the equipping against us of the Danish navy, a force of sixteen sail of the line, not manned or ready for sea, but capable of being fitted out without a great sacrifice. The ministry of 1807 founded their claim to public favour on a system of vigour,—on a course altogether opposite to the cautious calculations of their predecessors. No sooner were they apprized of the treaty of Tilsit, than, without waiting for its effect on the Danish government, they determined on the as yet unexampled measure of taking forcible possession of a neutral fleet. A powerful armament of twenty thousand troops and twenty-seven sail of the line, prepared ostensibly against Flushing and Antwerp, was directed to proceed to the Sound, there to await the result of a negotiation opened at Copenhagen. This negotiation was intrusted to a special envoy, who represented the danger to Denmark from France and Russia, and demanded the delivery of the Danish fleet to England, under a solemn stipulation of its being restored on the termination of our war with France. The Danes, justly offended at this proposal, and aware that their agreeing to it would expose them to the loss of the continental part of their territory, refused: our envoy returned on board our fleet: our army was landed, and Copenhagen invested by sea and land, while a part of our fleet cut off all communication between the continent and the island on which it stands. After a fortnight passed in preparations, a heavy fire was opened on the city, and continued during two days with very great effect. A capitulation now took place; the citadel, dock-yards, and batteries were put into our hands, and no time was lost in fitting out the Danish men of war for sea. All stores, timber, and other articles of naval equipment, belonging to government, were taken out of the arsenals, embarked, and conveyed to England.

The expedition to Copenhagen excited much discussion and difference of opinion in England, particularly when it was avowed that ministers had no evidence of an intention in Russia to coerce Denmark, and still less of a disposition in Denmark to give way to such coercion. The only tenable ground was, to acknowledge at once that the Danes had given no provocation whatever; that their conduct had been strictly neutral; but that they would evidently have been unable to defend themselves had Russia and France united against them. Still it was extremely questionable, whether we, to ward off a contingent annoyance, should have committed a present aggression. The success of our attempt, considering our naval superiority, the insulated position of Copenhagen, and its unprepared state, admitted of little or no doubt. But this was not all. There remained further and more important considerations; the odium that would be thus excited against us in the Danish nation, and that closer approximation of Russia to France, which could hardly fail to follow so open an affront to a power professing to take a lead in the political arrangements of the Baltic.

The Cape of Good Hope surrendered in January 1806 to an armament sent from England. After this, Sir Home Popham, who commanded the naval part of the expedition, ventured to make, without the sanction or even knowledge of government, an attempt on Buenos Ayres. Our troops, although under two thousand in number, effected a landing, and occupied the town. Intelligence to this effect having

reached England, the popular notion that Buenos Ayres would prove a great market for our manufactures, induced government to take measures for completing the new conquest. And though the inhabitants soon rose and drove out the feeble detachment under Sir Home Popham, an armament, which arrived in January 1807, under the command of Sir Samuel Auchmuty, attacked the strongly fortified town of Monte Video, and carried it by assault, which was conducted with great skill and gallantry. But a very different fate awaited our next enterprise,—an attack on Buenos Ayres, planned by General Whitelocke, an officer wholly unfit for this or any other kind of service. Our troops, eight thousand in number, were, under every disadvantage, successful in some parts; but failing in others, the result was a negotiation, and a convention that we should withdraw altogether from the country, on the condition of our prisoners being restored.

But in another part of the world, and against an enemy in general far more formidable, our arms had been attended with success. Naples had been engaged in the coalition of 1805, with a view to assail the French on the side of Lombardy; but an Anglo-Russian army, landed for that purpose, had been prevented from marching northward by the disastrous intelligence from Germany. They were subsequently re-embarked, the British withdrawing to Sicily, and Palermo becoming once more the refuge of the Neapolitan court. That court, eager to excite insurrection against the French in Calabria, prevailed on General Sir John Stuart, in the beginning of July 1806, to lead thither a detachment of our troops. They landed, and soon after received intelligence, that at Maida, distant only ten miles from our encampment, was a French corps, already equal to our own, and hourly expecting considerable reinforcements. Our troops marched to attack them on the morning of 4th July, and at nine o'clock drew near to their position, which had a river in front. But General Regnier, who commanded the French, having received his reinforcements the preceding evening, and seeing that our small army was unprovided with cavalry, caused his men to march out of their camp, and advance to charge us on the plain. Our force, including a regiment landed that morning, was nearly six thousand; that of the enemy above seven thousand. The French, who knew our troops only by report, marched towards them with great confidence, not expecting them to stand the charge. Our line, however formed, faced the enemy, and advanced; the forward movement of the opposing lines lessening the intervening distance in a double ratio. On a nearer approach the enemy opened their field-pieces, but, contrary to the usual practice of the French artillery, with little effect. Not so the British; for when our artillery opened, every shot told, and carried off a file of the enemy's line. The lines were now fast closing, being within three hundred yards distance, and a fire having commenced between the sharpshooters on the right. At this moment the enemy seemed to hesitate, halted, and fired a volley. The British line also halted, returned the salute, and having thrown in a second volley, advanced at full charge. The enemy, apparently resolved to stand the shock, kept perfectly steady, till, intimidated by the advance, equally rapid and firm, of an enemy whom they had been taught to despise, their hearts failed, and they faced about and fled, but not in confusion. When they approached within a short distance of their second line, they halted, fronted, and opened a fire of musketry on our line, which did not follow up the charge to any distance, but halted to allow the men to draw breath, and to close up any breaks in their formation. They were soon ready, however, to advance again; and the order to charge having once more been given, our brave troops rushed forward to the onset, the enemy, as

Reign of George III. before, making a show of determination to remain firm. But their courage again failed them; they would not stand the shock; and giving way in greater confusion than before, their first line was thrown upon the second, and both became intermingled in great disorder. Seeing himself thus completely foiled in his attack on the front, and being driven back more than a mile, Regnier now made an attempt to turn the left flank; but this was defeated by the British second line, which, refusing its left, opened an admirably directed and destructive fire, which quickly drove back the enemy with great loss. Their efforts were equally unsuccessful against the right of our line, which also charged in the most gallant and decisive manner, and the field of battle remained entirely in our possession.¹ The French loss in killed and wounded was upwards of two thousand; ours only between three hundred and four hundred. This brilliant exploit produced the evacuation of part of Calabria by the French, but had no other result; our small force returning soon afterwards to Sicily.

Our next operation in the Mediterranean was an unsuccessful menace of the Turkish capital. That court refusing to enter into our plans of hostility to France, our ambassador withdrew, and re-entered the Straits of the Dardanelles with a squadron of seven sail of the line, exclusive of frigates and bombs. They suffered considerably in passing the narrow part of the straits, between the ancient Sestos and Abydos, now called the castles of Romania and Natolia. Anchoring at a distance of eight miles from Constantinople, our admiral, Sir J. Duckworth, threatened to burn the seraglio and the city, but in vain. The Turks continued adverse to our demands, and employed the interval, wasted by the British commander in useless negotiations, in strengthening the formidable batteries of the Dardanelles. It soon became indispensable therefore to withdraw, and to repass the straits; but this was not accomplished without a considerable loss in killed and wounded, the cannon at the castles being of great size, and discharging granite balls, one of which, weighing eight hundred pounds, cut in two the mainmast of the Windsor man of war. A descent made soon after in Egypt was equally unfortunate. A detachment of troops landing at Alexandria, occupied that town, but suffered a severe loss at Rosetta, and eventually withdrew, on the Turks consenting to give up the prisoners they had taken. Peace was soon after concluded with the Turks, and our operations in the Levant were confined to the capture of the Ionian Islands from the French. Zante, Cephallonia, Ithaca, and Cerigo, were taken by a small expedition in 1809, and Santa Maura the succeeding year.

On the side of Sicily, our commanders, though pressed by the court of Palermo, refused to make descents on Calabria, which could lead to nothing but partial insurrections, followed, on the return of a superior force, by the death of the most zealous of our partisans. We took, however, in June 1809, the small islands of Ischia and Procida, near the coast of Naples; and, in the autumn of 1810, repelled an attempt of Murat to invade Sicily. A body of nearly four thousand Italians, who had landed on this occasion, were driven back with loss; a failure which, joined to our decided naval superiority, put an end to all attempts of the kind.

The hostility of Russia consequent on her connection with France produced a menaced invasion of Sweden, now our only ally in the north. To aid in repelling it, Sir John Moore was sent to Gottenburg with a body of ten thou-

sand men. This force did not land; but the general, repairing to Stockholm, entered into communications with the king, and had the mortification of finding that prince wholly incapable of rational conduct, and bent on projects which would necessarily involve the sacrifice of the British troops. On this he lost no time in returning to Gottenburg, and soon afterwards brought back the armament to England, to be employed on a more promising service.

The influence possessed by Bonaparte over Spain had long inspired him with the hope of overawing Portugal, and of obliging that country to dissolve her alliance with England. To this hope the humiliation of Germany, and his new alliance with Russia, gave double strength; and, in the latter part of 1807, the most peremptory demands were made on the court of Lisbon. To part of these, implying the exclusion of British merchantmen from the harbours of Portugal, compliance was promised; but the demand of confiscating English property, and detaining the English resident in Portugal, was met by a decided refusal. A French army now marched towards Lisbon, and threatened openly to overthrow the house of Braganza; but the latter, after some momentary indications of indecision, took the determination of abandoning their European dominions, and proceeding to Brazil. This spirited, and by many unexpected measure, was carried into effect in the end of November, and Lisbon was forthwith occupied by French troops. A few months afterwards occurred the transactions at Bayonne, and the general declaration of hostility by the Spaniards to Bonaparte. Our cabinet now determined to postpone all other projects to that of a vigorous effort in Spain and Portugal. With that view, an armament of ten thousand men, collected at Cork, and said to be intended for Spanish America, sailed in July for the Peninsula, and offered its co-operation to the Spaniards in Galicia. They, however, thought it best that we should confine our aid to Spain to arms and money, directing our military force against the French army in Portugal. Accordingly, our troops, after passing an interval at Oporto, were landed to the southward, in Mondego Bay, where, after receiving the co-operation of another division of British, and of a few Portuguese, they proceeded on their southward march towards Lisbon. The first actions took place with French detachments at the small town of Obidos, and at Rorica. Neither was of much importance: the French, inferior in number, retreated; but their commander at Lisbon was Junot, an officer trained in the school of revolutionary enterprise, and disposed, like most of his brethren at that time, to make light of British land forces. He determined forthwith on assuming offensive operations, advanced from Lisbon, and reaching the British army on the 21st of August 1808, attacked it in its position at the small town of Vimiero. The force on either side was about fourteen thousand men. The French marched to the onset in columns, with their wonted confidence; but they had to encounter an enemy equally firm with Germans or Russians, and far superior in discipline, equipment, and activity. The principal column of the enemy, headed by General Laborde, and preceded by a multitude of light troops, mounted the face of the hill forming the crest of the British position, with great fury and loud cries, and, forcing in our skirmishers upon the lines, crowned the summit; but, shattered by a terrible fire of the artillery, breathless from their exertions, and riddled by a discharge of musketry from the fifteenth regiment at half-pistol shot distance, they were vigorously charged in front and flank, and overthrown.² Equal success attended our efforts in

¹ Stewart's *Sketches and Military Service of the Highland Regiments*, vol. ii. p. 265 et seqq. 2d edition.

² Napier's *History of the Peninsular War*, vol. i. p. 213.

of other parts of the line, and the loss of the enemy was three thousand men and thirteen pieces of cannon. The object now ought to have been to follow up our success, before the French had time to recover themselves, and fortify the almost impenetrable mountains on the road to Lisbon. In vain did Sir Arthur Wellesley urge this, first on Sir Harry Burrard, who had now taken the command, and next day on Sir Hew Dalrymple, who arrived and replaced him. Reinforcements were daily expected; and, till their arrival, neither of these officers could be persuaded to incur hazards for the attainment of an advantage which, from their unacquaintance with localities, they were not competent to appreciate. A precious interval was thus lost. The French occupied the passes, opened their negotiation in a tone of confidence, and obtained, by the treaty called the Convention of Cintra, a free return to France on board of British shipping. The ministry, though disappointed, determined to defend this convention; judging it indispensable, partly from the communications of Sir Hew Dalrymple, more from its bearing the unqualified signature of Sir Arthur Wellesley, who was, even then, their confidential military adviser. The public, however, called for inquiry; ministers felt the necessity of acceding; the three generals were ordered home from Portugal; and, after a long investigation, and divided opinions, the chief error was found to consist in stopping General Ferguson in the career of victory, when about to cut off the enemy's retreat to Lisbon, and in the loss of the twenty-four hours which followed the battle of Vimiero.

The public disappointment at the convention of Cintra was soon counterbalanced by gratifying intelligence from the Baltic. Bonaparte, whose plan was to subjugate all Europe, by making one nation instrumental in overawing another, had sent the Spanish regiments in his service into Denmark; but he could not prevent their receiving intelligence of the rising spirit of their countrymen, and the vicinity of a British fleet happily facilitated their evasion. Ten thousand Spaniards were thus brought off, and carried, with their arms, stores, and artillery, to join the standard of their country.

Meantime the command of our troops in Portugal was vested in Sir John Moore, and arrangements were made for moving them forward into Spain. But from the badness of the roads, it was necessary to advance in two divisions, one marching due east, and another north-east; while a further force, which had arrived from England at Corunna, was instructed to hold a south-east course. The lateral divisions received, in their progress, orders to adapt the direction of their march to existing circumstances; but the result was, that both converged towards the central division, conducted by Sir John Moore in person.

In their march our officers had an ample opportunity of witnessing the fallacious and exaggerated impressions entertained in England with regard to the supposed enthusiasm of the Spaniards. They saw a country wretchedly cultivated and thinly peopled; a nation hostilely disposed, indeed, to the French, but unaccustomed to exertion, and incapable of combination. Instead of recruits, supplies of provisions, or offers of voluntary service, all was inactivity and stagnation; and, amidst the general poverty, our commissariat had great difficulty in obtaining provisions. Another great source of perplexity was the want of information. The natives, whether in the civil or military service, were too ignorant and credulous to be capable of detecting exaggeration, or of distinguishing truth from falsehood; and our officers were obliged to judge for themselves under the most contradictory rumours.

Sir John Moore reached Salamanca on the 13th of November, aware that the Spaniards had been defeated at Burgos, and soon after apprised that a French corps was advancing

to Valladolid, within sixty miles of his front. In this situation he received from Madrid the most urgent solicitations to advance thither with his army, either in whole or in part. He knew the ardour of his country for the cause of Spain, and directed his movements in the view of complying, as far as should be at all advisable, with the representations pressed on him; but day after day the intelligence became more discouraging. At last, the fall of Madrid, ascertained by an intercepted letter of General Berthier, removed every doubt, and left him no other plan but that of uniting his three divisions, and determining on a retreat; but, as his army was now augmented to twenty-five thousand men, he determined, if possible, to strike a blow against the detached French army under Soult, stationed at some distance to the north-east. With this view, our troops advanced on the 11th of December towards the small town of Sahagun, and a partial action, which took place between the opposite vanguards, was to our advantage; but intelligence arriving that Bonaparte was directing, by the passes of the Guadarama, a superior force on a point in rear of the British, it became indispensable to make a prompt and uninterrupted retreat. Bonaparte, pressing forward with his vanguard, reached our rear at Benavente, saw, for the first time, British soldiers, and witnessed a cavalry action, in which several squadrons of his guard were very roughly handled, and their commanding officer, Lefebvre Desnouettes, made prisoner. Meanwhile, Soult, marching by a different road, hoped to cross our line of retreat at Astorga; and the Spaniards having abandoned the position which covered the access to that town, it required both prompt and skilful exertion to enable our army to occupy it before the enemy. Here, pressed as we were, it became necessary to destroy a great part of our camp equipage. Our army was ahead of the enemy, but had before it a long and difficult march over the mountains of Galicia. The weather was severe, provisions scanty, the inhabitants cold and unfriendly; while privations and disappointment relaxed the discipline of our soldiers, who called loudly to be led to action, as the close of their distress. Retreat, however, was unavoidable; and, in this state of suffering and insubordination, the army performed a march of more than two hundred miles; the general keeping in the rear to check the French, who followed with their usual audacity. At Lugo, about sixty miles from Corunna, circumstances seemed to justify our awaiting the enemy, and fighting a general battle. Our soldiers repaired with alacrity to their ranks, but Soult did not accept the challenge, and the retreat was continued. It closed on the 12th January 1809, having been attended with the loss of many men, from disorder, and the sacrifice of many horses, from want of forage, but without losing a standard, or sustaining a single check in action. On the 13th, 14th, and 15th, the sick and artillery were embarked on board our men of war; while the troops remained on shore, to await the enemy, and to cover the reproach of retreat by some shining exploit. This led to the battle of Corunna. On that day our position was good on the left, but very much otherwise on the right; thither, accordingly, the French pointed their strongest column, and thither also Sir John Moore repaired in person. He directed the necessary movements, first to obstruct, and afterwards to charge, the advancing enemy. These orders were gallantly executed, and the attack of the French repelled; but our lamented general received a wound, which soon after proved mortal, from a cannon ball, that struck him on the shoulder, and knocked him off his horse. Subsequent attacks, first on our centre, and next on our left, were equally foiled; and, in the evening, we occupied an advanced position along our whole line. Enough having now been done for the honour of our arms, the embarkation was continued on the 17th, and

Reign of George III. completed on the 18th, after which the whole set sail for England.¹

The session of 1808 was opened on 31st January by a speech of uncommon length, which enlarged on the Copenhagen expedition; our relations with Russia, Austria, and Sweden; the departure of the royal family of Portugal to Brazil; and our orders in council respecting neutrals. The chief debates of the session related to these subjects. The Copenhagen expedition was much canvassed, as unprovoked by Denmark, and incompatible with the honour of England. Still that measure received the support of a great majority, Mr Ponsonby's motion for the production of papers relating to it being negatived by two hundred and fifty to a hundred and eight, and a similar motion in the House of Lords by a hundred and five to forty-eight. Even a motion for preserving the Danish fleet, to be restored, after the war, to Denmark, was negatived in both houses.

The volunteer system had, since 1804, been greatly relaxed, and the country evidently stood in need of a more constant and efficient force. The Grenville ministry, adverse to the volunteer system, had determined to let it fall into disuse, and to replace it by a levy of two hundred thousand men, to be trained to act, not in battalions, but separately, and as irregulars, on the principle that local knowledge was the chief recommendation, and a continuance of previous habits the proper exercise, of such a force. The new ministry, however, pursued a different course, and passed an act for a local militia; a body which, with the exception of the officers, was composed of the lower orders, pledged to regular training during one month in the year, and subjected to all the strictness of military discipline. Such of the volunteers as chose were to remain embodied; the total of the local militia was about two hundred thousand, and the mode of levy was by a ballot of all persons, not specially exempted, between the age of eighteen and thirty-one.

The orders in council were frequently discussed during this session, but they were as yet imperfectly understood either in their immediate operation or in their consequences. Unfortunately for the advocates of moderation, Bonaparte now lost all regard to justice, and committed the most lawless of all his acts, the seizure of the Spanish crown. Indignation at this atrocity, and a firm determination to support the Spanish cause, were manifested by men of all parties, among whom were remarkable, as habitual members of opposition, the Duke of Norfolk and Mr Sheridan; the latter making, on this occasion, one of the most brilliant speeches of his latter years.

The session of 1809 was opened on 13th January by a speech declaring a decided determination to adhere to the cause of the Spaniards, notwithstanding the failure of the

campaign, and the retreat of our army under Sir John Moore. The intelligence that arrived soon after the death of that commander drew from the house a unanimous eulogy of his character, and regret for his fall. There still prevailed, both in parliament and the public, a strong attachment to the Spanish cause; and, in the various motions made by the opposition to censure ministers for mismanaging our armaments, or ill planning our operations, the minority seldom exceeded a third of the members present.

But the attention of parliament and the public was withdrawn even from this interesting question, and absorbed by the charges against the Duke of York, brought forward by Colonel Wardle, on evidence given or procured by Mrs Mary Anne Clarke, a forsaken mistress of the duke. Ministers, unaware of the extent of the proofs, brought the inquiry before the house instead of referring it to a committee, and a succession of singular disclosures were thus made to parliament and the public. Of these the most remarkable were produced by the friends of the duke persisting in examinations begun under an impression of his entire innocence. It is hardly possible to describe how much this subject engaged the public attention during the months of February and March. Of the influence of Mrs Clarke in obtaining military commissions from the duke, and of her disposing of them for money, there could be no doubt. The question was, whether the duke was apprised of this traffic; and though he might not be aware of its extent, there seems hardly room to doubt that, in certain cases, he suspected its existence. The debate on the collective evidence was uncommonly long, being adjourned from night to night, and exhibited a great difference of opinion on the part of the speakers. Several resolutions, varying in their degree of reprehension, were proposed; and though those finally adopted condemned only the immorality of the connection formed by the duke, without asserting his knowledge of the pecuniary abuses, the result was his resignation of the office of commander-in-chief.

The success of this investigation prompted an inquiry into other abuses, particularly the sale of East India appointments, and disclosed a negotiation of Lord Castlereagh to barter a nomination to a Bengal writership, for the return of a member to parliament. The house declined to proceed to any resolution against his lordship, or to entertain a motion relative to the interference of the executive government in elections. A bill for parliamentary reform, brought in by Mr Curwen, was not directly opposed, but so materially altered in its progress as to be nugatory when it passed into a law. The further business of the session consisted in the annual votes for the public service, and in motions by Sir Samuel Romilly, on a sub-

¹ The following masterly defence of the necessity as well as the conduct of this celebrated retreat, is extracted from Napier's *History of the Peninsular War*, vol. i. p. 525.

"Lord Bacon observes, that 'honourable retreats are no ways inferior to brave charges, as having less of fortune, more of discipline, and as much of valour.' That is an honourable retreat in which the retiring general loses no trophies in fight, sustains every charge without being broken, and finally, after a severe action, re-embarks his army in the face of a superior enemy without being seriously molested. It would be honourable to effect this before a foe only formidable from numbers, but it is infinitely more creditable, when the commander, while struggling with bad weather and worse fortune, has to oppose veterans with inexperienced troops, and to contend against an antagonist of eminent ability, who scarcely suffers a single advantage to escape him during his long and vigorous pursuit. All this Sir John Moore did, and finished his work by a death as firm and glorious as any that antiquity can boast of."

"Put to Lord Bacon's test, in what shall the retreat to Corunna be found deficient? something in discipline, perhaps, but that fault does not attach to the general. Those commanders who have been celebrated for making fine retreats were in most instances well acquainted with their armies; and Hannibal, speaking of the elder Scipio, derided him, although a brave and skilful man, for that, being unknown to his own soldiers, he should presume to oppose himself to a general who could call to each man under his command by name; thus inculcating, that unless troops be trained in the peculiar method of a commander, the latter can scarcely achieve any thing great. Now Sir John Moore had a young army suddenly placed under his guidance, and it was scarcely united, when the superior numbers of the enemy forced it to a retrograde movement under very harassing circumstances; he had not time, therefore, to establish a system of discipline; and it is in the leading events, not the minor details, that the just criterion of his merits is to be sought for."

ject which has been but lately followed up with effect, the amendment of our criminal law, by lessening the severity, but insuring the application, of punishments.

The failure, in autumn, of the expedition to the Scheldt, and the resignation of the Duke of Portland when on the verge of the grave, led to the disclosure of a remarkable secret in cabinet history—the attempts made, during several months, by Mr Canning, to obtain from the Duke of Portland the removal of Lord Castlereagh from the war department, on the ground of incompetency to the station. On making this mortifying discovery, the complaint of Lord Castlereagh was, not that his brother minister should think with slight of his abilities, but that, during all the time that he laboured against him, he should have maintained towards him the outward manner of a friend. This led to a duel, followed, not by serious personal injury, but by the resignation of both; causing, in the ministry, a blank which, to all appearance, could be filled only by bringing in the leaders of opposition. An overture to this effect, whether sincere or ostensible, was made by Mr Perceval. Lord Grenville, on receiving it, came to London; Lord Grey, more indifferent about office, answered it from his seat in Northumberland; but both declared a determination to decline taking part in the administration so long as the existing system should be persisted in. Marquis Wellesley, who had gone as ambassador to the Spanish junta, now returned, and was invested with the secretaryship for foreign affairs. Mr Perceval was appointed premier; and the new ministry, feeble as they were in talent, received the support of a decided majority in parliament; so general was the hatred of Bonaparte, and the conviction that our safety lay in a vigorous prosecution of the war.

Our failure in the campaign of 1808–9 was far from discouraging our government from new efforts. Austria was preparing to attack the allies of Bonaparte in Germany; and the Spaniards, though repeatedly beaten in close action, continued a destructive warfare in the shape of insulated insurrections. Sir Arthur Wellesley was accordingly sent with a fresh army to Lisbon, and General Beresford with a commission to discipline the Portuguese forces. They found the French threatening Lisbon in two directions; from the east, with a powerful force under Victor; from the north, with a less numerous body under Soult. Sir Arthur Wellesley advanced against the latter, drew near his rear guard on the banks of the Douro, drove it over that river, and crossing immediately after, forced Soult to a precipitate retreat from Oporto. Returning to the southward, our commander obliged the force under Victor to draw back; and having, some time after, effected a junction with a Spanish army, took the bold determination of moving forward in the direction of Madrid by the valley of the Tagus. The French now sent reinforcements to the army of Victor, and the opposing forces met at Talavera de la Reyna, a town to the north of the Tagus, near the small river Albarche. The British force was nineteen thousand, and that of the Spaniards above thirty thousand; the French army amounted to upwards of forty-seven thousand men. Lord Wellington was too distrustful of the discipline of his allies to venture an attack on the French, but he saw no imprudence in trying, as at Vimiero, the chance of a defensive action. Stationing the Spaniards on strong ground on the right, he occupied with the British a less strong but yet favourable position on the left. Against the army thus posted the French advanced in the afternoon of 27th July, driving in our advanced post, and attacking an eminence on our left. This eminence, the key of the position, would have been assailed from the beginning by Bonaparte, with a formidable column; but the rifle corps and a single battalion sent against it by Victor were speedily

driven back by our troops. A second attack, made in the evening by three regiments of infantry, was at first successful, but it was soon repelled by a fresh division of British troops. The main body of the French, surprised at this failure, waited impatiently for morning to renew the attack; they advanced, marched through a destructive fire to the top of the rising ground, approached our cannon, and were on the point of seizing them, when our line rushed forward with the bayonet, and drove them back with great loss. Their commanders now determined to suspend all attacks on the right of the position, and to bring a mass of force against the front and flank of the British left. A general attack took place at four in the afternoon, and the troops directed against the height now consisted of three divisions of infantry, or about eighteen thousand men. Crossing the ravine in their front, the first division scaled the height amidst volleys of grape-shot; but its general fell, a number of officers shared his fate, and retreat became unavoidable. No attempt was now made to carry the eminence in front; attacks were made on its left and right, but all were ineffectual. The left, indeed, was the weak part of the British position; but an event, unfortunate in its immediate results, served to check their audacity in this quarter, and to prevent the renewal of any serious attempt against this part of our line. Sir Arthur Wellesley having observed a French division (Villatte's), preceded by grenadiers, and supported by two regiments of light cavalry, advancing up the valley against the left, while another (Ruffin's) was directing its march towards a mountain which flanked the left transversely, in order to turn it, directed Anson's brigade of cavalry, consisting of the twenty-third light dragoons and the first German hussars, to charge the head of these columns. The order was instantly obeyed; the brigade moved off at a canter, and increasing its speed as it advanced, rode headlong against the enemy; but in a few moments it came upon the brink of a cleft which was not perceptible at a distance. The French threw themselves into squares, and opened their fire. Colonel Arentschild, commanding the German hussars, promptly reigned up, exclaiming, "I will not kill my young men;" and it would have been well if the twenty-third had followed the example of the experienced veteran. But English impetuosity was not to be restrained. The twenty-third rode wildly down into the hollow; men and horses fell over each other in dreadful confusion; yet the survivors, still untamed, mounted the opposite banks by twos and threes; and Major Ponsonby rallying all who came up, they passed through the midst of Villatte's columns, reckless of the musketry from each side, and fell with inexpressible violence upon a brigade of French chasseurs in the rear. The combat was fierce but short. Attacked by Victor's Polish lancers and the Westphalian light horse, exposed on both sides to the fire of the squares of infantry, and engaged with the chasseurs in front, they were at length broken; and those who were not killed or taken escaped behind a Spanish division, leaving behind about half the number which went into action. But, however unfortunate in its circumstances, the desperate fury of this charge appalled the French, and effectually checked their advance on a point where the chances of success were otherwise much in their favour. This battle, which was one of hard, honest fighting, reflected little credit on the generalship of either party. The loss on both sides was unusually severe; that sustained by the British, in the two days' fighting, amounting to upwards of six thousand in killed and wounded, and that of the French to about seven thousand four hundred.

Notwithstanding this dear-bought success, it became necessary for the allied army to retire; the French divi-

sions in the north-west of Spain having united and begun to march in a direction which would soon have brought them on our rear. Our army crossed the Tagus at Arzobispo, and held a south-west course till it reached Badajoz, where it remained during the rest of the year, in a position which covered that fortress, and showed the Spaniards that we had not abandoned their cause, however dissatisfied with their co-operation, and convinced of the impracticability of combining offensive operations with such allies.
